Mr. O'Reilly's *Songs from the Southern Seas*‡ can hardly be called poetry, but as illustrations of life in a penal colony they are not devoid of interest.

The author of *The Martyrdom of Jesus of Nazareth*§ is a Jew, who, professing to be free from sectarian and party bias, and claiming for himself a more intimate knowledge of the Rabbinical writings, and consequently of the spirit of the time and country in which Jesus lived, than is possessed by European scholars, offers this work as an historico-critical treatise on the last chapters of the Gospel.

The *Bibliotheca Diabolica*|| of Messrs. Scribner and Co. is a catalogue of rare and curious books relating to the Devil. It is divided into two parts; the first containing the titles of the humorous works on the subject, the second those of the serious ones. It lays claim to unprecedented completeness, on the ground that books which only incidentally treat of diabolism are included in the index.

We may conclude with the mention of the *Penn Monthly*¶ for September and October, a periodical whose chief *raison d'être* seems to be to combat "English Political Economy"—that is to say, the doctrine of Free-trade—and to support a Protection policy.

* *Under the Trees*. By S. J. Prime. New York: Harper & Brothers. London: Sampson Low & Co.

† *The Lost Model*. By H. Hooper. Philadelphia: Lippincott & Co. London: Trilbner & Co.

‡ *Songs from the Southern Seas*. By J. B. O'Reilly. Boston: Roberts Brothers. London: Sampson Low & Co.

§ *The Martyrdom of Jesus of Nazareth*. By Dr. J. M. Wise. Office of the American Israelites: Cincinnati.

EDUCATION in PARIS.—A MARRIED LADY, who, with her Husband (a German by birth), resides in a charming and airy part of Paris, is desirous of meeting with THREE or FOUR LITTLE GIRLS, or TWO YOUNG LADIES, to whom she offers great Educational advantages, together with all the comforts and refinements of a well-appointed Home. The highest English references can be given.—Address, B.A., Stevens's Library, 14 Duke Street, Grosvenor Square.

A CLERGYMAN wishes to place his TWO SONS (aged respectively Ten and Nine, after the Christmas Vacation, at a good PREPARATORY SCHOOL, of moderate size, in some healthy part of one of the Midland or Home Counties. Address, with particulars, "M.A. Oxford," care of Mr. Roworth, Bookseller, St. Ann's Square, Manchester.

A GENTLEMAN wishes to place his SON, an intelligent and well-taught Deaf and Dumb Youth of seventeen, with an able and conscientious TUTOR, residing in the neighbourhood of London, Oxford, or Edinburgh, who would carry on his Education in Classics, Mathematics, and Science. A guarded and comfortable home in a healthy, bracing situation would be essential. Communications to be addressed, S. M., Post-Office, Bradford, Yorkshire.

A CLERGYMAN wishes to find for an ORPHAN NIECE, aged 21, a Situation as COMPANION to a Lady.—With and for full particulars, address Rev. J. COX EDWARDS, Bolnisi Villa, Victoria Road, Moultham.

LONGFELLOW'S HANGING of the CRANE.—The EDITOR and PUBLISHER of THE HORNET have to express their regret for having inserted Mr. LONGFELLOW'S New Poem, THE HANGING of the CRANE, in their last Issue without having first obtained the sanction of Messrs. GRONER, ROUTLEDGE and Sons, the Proprietors of the Copyright, to do so. The EDITOR was not aware that this Poem had been published in February last by Messrs. ROUTLEDGE, who inform him that they are about to publish another Edition of it copiously illustrated by eminent American Artists.

The EDITOR begs to express his Thanks for the liberal way in which Messrs. ROUTLEDGE and Sons have accepted this note as a condonation of the infringement.

EXPERIENCED FAMILY COURIER, speaking English, French, German, Italian, Russian, and Greek, with unexceptionable references, is open to an ENGAGEMENT.—Address, J. FIDUS, Charing Cross Hotel.

OVERLAND ROUTE and SUZ CANAL.—Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, on the Suz Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday.—Offices, 129 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

MALVERN.—HYDROPATHY.—Dr. RAYNER'S ESTABLISHMENT (formerly Drs. Wilson and Rayner). For prospectus apply to T. RAYNER, M.D., Malvern.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. Physician—Dr. EDWARD TANE, M.A., M.D., Edin. For Invalids and those requiring rest and change. Turkish Baths on the premises.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. ROBERT PARK, Manager.

ILFRACOMBE HOTEL, Ilfracombe, North Devon.—Delightful Location. Beautiful Scenery. 250 Rooms. Appointments perfect. Cuisine excellent. Wines choice. Accessible from all parts by Steam and Rail (see Time Table).

MARGATE.—The CARLTON HOTEL, facing the Sea, open all the year at one charge. Boarders, £3 3s. per Week. Breakfast at 9 o'clock A.M.; Luncheon at 1; Dinner at 6. Tea and Coffee served at 9 P.M. in a most splendid Drawing-room. The Drawing-room, with its ample Balcony, is open all day from 10 A.M. to 11 P.M. A good Piano. To keep the Hotel very select references are required a few days before entrance. B. KERR, Proprietor.

PUBLICATION of EDUCATIONAL WORKS.—All AUTHORS desirous of bringing their WORKS under the direct notice of the Scholastic Profession are informed that KELF & BROTHERS have unusual opportunities of assisting them in this respect, as their Travellers, who visit the greater part of England twice a year, call on all the principal Educational Establishments in the Kingdom, and by this means introduce, in the most efficient way, all Books committed to their care.—Charterhouse Buildings, Aldersgate, E.C.

E. DENT & CO., 61 Strand, and 34 Royal Exchange, Manufacturers of CHRONOMETERS, WATCHES, ASTRONOMICAL and TURKISH CLOCKS, to Her Majesty, B.R.H., the Prince of Wales, and H.R.H. the Emperor of Russia; Makers of the Great Clock of the Houses of Parliament, and of the New Standard Clock of the Royal Observatory, Greenwich. Catalogues on application.—E. DENT & CO., 61 Strand, 34 Royal Exchange (adjoining Lloyd's), and Factory, Savoy Street, London.

GOOD FLOOR CLOTH.—TRELOAR & SONS, 69 LUDGATE HILL, LONDON.

Bankers.

LONDON—RANSOM & CO.

NEW YORK—J. G. KING'S SONS.

THE ILLUSTRATION COMPANY have the pleasure to announce that they have made arrangements with Directors of the Lotos Club, in New York, for the disposal of Advance Sheets of New Books, Magazine Articles, &c., in every part of the United States.

A system of direct communication between Authors and Publishers in Europe and the principal literary centres of America has long been wanting, because the fact is scarcely realised that there are in the United States at least twenty "literary centres," and that nearly every Book or original Article published in Europe has some money value in America, if sent out in time and to the right quarters.

Under the present system nearly every English work of importance, and unimportance, is offered by Publishers to their Agents in New York, Boston, or Philadelphia, and it declined, the time is lost for further negotiation. Here the ILLUSTRATION COMPANY steps in with its facilities for offering the Sheets elsewhere, on an independent footing; obtaining, perhaps, a smaller sum than originally asked for, but still something, with but a nominal cost to Author or Publisher. The machinery set on foot by the ILLUSTRATION COMPANY will be thus valuable to those who have, and to those who have not, correspondents in America.

Publishers having correspondents in America, who find no use for Advance Sheets sent to them, can instruct that they be passed on at once to "the Agents of the ILLUSTRATION COMPANY, Lotos Club, New York."

Authors and Publishers who have no Agents in America have nothing to do but to fill up a form, to be had on application, and post it with postage to 210 Strand, London, W.C., whence they will be immediately transmitted to America.

In the present state of International Copyright Law, it seems doubtful whether any system could be better adapted to the wants of English Authors and Publishers, because, if properly managed, it will assist rather than interfere with existing connections, and is perfectly independent in action.

* Christmas Stories, articles in type for the December and January Magazines, and for the forthcoming "Quarterlies," are being sent by every mail.

Forms and further particulars may be obtained on application at the Company's Offices, 210 Strand, London, W.C.

ISSUE of 6,500 SEVEN-AND-A-HALF PER CENT. PREFERRED SHARES of £10 each, entitled to further participation in Profits, after payment of a similar rate of Dividend on 3,500 Deferred Shares.

HOMER HILL COLLIERY COMPANY, LIMITED.

Directors.

JOHN ABRAHAM, Esq., Northfield, Director of the Birmingham Small Arms and Metal Company, Limited.

STEPHEN BARKER, Esq., Calthorpe Fields, Edgbaston, Director of Muntz's Metal Company, Limited.

THOMAS BARKER, Esq., Beacon Hall, Lichfield, Director of the Chillington Iron Company, Limited.

JOHN KING, Esq., Bennett's Hill, Birmingham (of the firm of J. C. Abbott & Co., Coal Merchants).

J. S. EVERS SWINDELL, Esq., Sumner Hill, Kingswinford, Dudley, Ironmaster.

The above is one of the best of the South Staffordshire Thick Coal Collieries.

It is freehold, fully developed, and the maximum profit, after providing for the redemption of the entire capital, is estimated at more than double the amount required to pay the preference dividend.

Proprietors may be obtained on application at the Office of the Company, 30 Abchurch Lane, London, and from the Auditors of the Company, Messrs. JAMES & EDWARDS, Tokenhouse Yard, London.

The Subscription List will close on Saturday, October 31.

THE GOVERNMENT OF LONDON.

MR. CROSS exercised a sound discretion in withholding all expression of opinion on the Municipality of London Bill. Lord Elcho would perhaps have been prudent if he had as carefully abstained from the use of argument or illustration. If he really thinks it strange that the City Corporation should view the Bill with distrust, and if he would as soon have expected VICTOR EMMANUEL to oppose the unity of Italy, he must have appreciated but imperfectly the tendency of the Municipal Bill and the history of Italian liberation. The King of SARDINIA largely extended his dominions by becoming King of ITALY. The dominions of the Lord Mayor are also to be enlarged, but he and his successors will no longer reign. Major LYON informed the HOME SECRETARY that the Metropolitan Board contained too many vestrymen; but the same class will rule London under the provisions of the Bill, by the name of members of the Municipal Council. The main issue is too important to be decided by a single Minister, who has at this time of year had no opportunity of consulting his colleagues. Attempts will probably be made to learn the intentions of Ministers when they dine on the 9th of November with a Lord Mayor who may possibly be doomed to extinction. Mr. DISRAELI is fortunately equal to the task of making an explicit statement which will convey no kind of information either to the Corporation or to their enemies. The deputation was in itself respectable, though there is no reason to suppose that it represented the opinions of the metropolitan community. The promoters of the movement have, with commendable fairness, embodied their wishes in the form of a Bill. As Mr. BEAL remarked to Mr. CROSS, the measure is simple, consisting practically in an extension to London of the provisions of the Municipal Corporation Act.

The Municipality of London Bill is carefully drawn, and it expresses with sufficient accuracy the views of the promoters. The question is one of general policy; and the details of course admit of alteration. If it is desirable that the metropolis shall be governed by an assembly directly elected by the ratepayers, there can be no insurmountable difficulty in arranging the machinery of election. The most objectionable part of the Bill, consisting in the transfer to the Corporation of the election of civic Judges and the control of the police, may probably have been inserted as an extreme claim to be afterwards abandoned or compromised. When the Crown appoints the Recorder of the pettyest borough, it would be anomalous to confer on a Town Council the appointment of the Recorder of London, or even of the Common Serjeant. It is true that the Recorder is at present appointed by the Corporation; but, if the Legislature determines to extend to London the provisions of the Municipal Corporation Act, there will no longer be any reason for preserving one isolated fragment of ancient customs which are in other respects abolished. It would be idle to expect that a numerous body representing popular suffrage will feel the responsibility which has been traditionally cultivated by the City Corporation. The Bill oddly provides that the election of Recorder shall be subject to the approval of the QUEEN, but that the election of the Common Serjeant shall be absolute. A veto is the most awkward form of control; and probably there will, in the event of a change, be little difference of opinion as to the expediency of vesting the judicial patronage of London in the QUEEN. The framers of the Bill have properly provided for the appointment of stipendiary magistrates in the City, in place of the Aldermen who will prac-

tically have ceased to exist. A criminal judge of high rank ought not to owe his promotion to popular favour.

The control of the police ought undoubtedly to be retained by the Government. It is true that the City Corporation has a police of its own which is equal to the Metropolitan Police in discipline and efficiency, though some inconvenience arises from a divided jurisdiction; but the Corporation of London is a responsible body, proud of its character, tenacious of its dignity, and bound to good behaviour in modern times by the insecurity of its position. Above all, the City Police is but a fraction of the entire force; and its numbers could never render it dangerous to public safety. The proposed Municipal Council will reflect the feelings of a constituency of whom the majority will belong to a class which may both grudge the expense of the police, and object in some cases to the employment of the force for the preservation of order. Mr. BEALES might not improbably have been a leading member of the Municipal Council or even Chairman of the Police Committee when his followers pulled down the Hyde Park railings. In times of sedition and riot it would be extremely inconvenient that the police should be at the disposal of a body which might perhaps be disaffected. In the worst days of municipal administration in New York, the Legislature of the State found it necessary to withdraw the control of the police from the City authorities. It may be hoped that even under a Municipal Corporation London will not sink to the level of New York, but it is certain that the wealth and cultivation of the metropolis will be practically unrepresented in the Council. It is a matter of Imperial concern that Parliament and the Government should not depend for protection on a force administered by the nominees of the metropolitan population. London belongs to the nation as well as to its small shopkeepers and artisans, and it would not be practicable to transfer the seat of legislation, as in New York and some other American States, to a provincial town beyond the reach of metropolitan democracy.

The promoters of the Bill deserve credit for the ingenious fiction by which they apparently perpetuate the ancient Corporation which they really intend to abolish. The Corporation is to retain all its titles and all its property, except that it will be not the same, but an entirely different body. The Municipal Council, which will for all purposes be supreme, is to contain two hundred members, of whom twenty will represent the City. Nine-tenths of the power of the present Corporation and its constituents will be transferred to new holders, who may at their pleasure deprive the unhappy citizens of all control over the municipal funds. The proportion allowed to the City is ridiculously insufficient, except on the assumption that all rights and powers ought to be distributed in proportion to the numbers of the resident population. The framers of the Bill take notice only of the small tradesmen, the caretakers, and the miscellaneous members of the humble class who sleep in the City. In the daytime the population is swelled by an additional half-million, and nearly the whole of the financial and commercial business of London is transacted within its limits. The citizens may perhaps be deprived of their privileges by the paramount authority of Parliament, but they certainly will not be hoodwinked by Mr. BEAL and his allies. It is nothing to them that the titular dignity of Alderman is to be retained, while the functions of the Court of Aldermen and of its members are summarily abolished. The Lord Mayor and the Aldermen will, after the passing of the Bill, no longer have any connexion with the City, nor is it necessary that any one

of their number should himself be a citizen. To use an American version of Mr. BEAL's phrase, the Corporation will have been amplified and developed off the face of the City.

The scheme is in some respects plausible; and it would be rash to assert that it may not possibly produce some kind of public benefit; but it is always necessary to beware when all men speak well of a measure, or listen in silence to its praises. In some important respects the incorporation of the metropolis is wholly without a precedent. No population of half the magnitude has ever been governed by a single elected assembly; nor has English legislation in a single instance sanctioned the transfer of an enormous property from one community to another. Finsbury, Marylebone, the Tower Hamlets, and Westminster have at present no more right to the property of the City than if they were situated in Devonshire or Yorkshire. It is now proposed by the clauses of a single Bill to take many thousands a year from the owners, and to give them without consideration to the inhabitants of the neighbouring districts. If the Bill becomes law, the citizens of London will no longer in their collective capacity have a shilling of their own; and it is but a minor grievance that they will only control in the proportion of one to ten the expenditure of the taxes which will be levied by votes of the majority in the Council. The able draftsmen who have prepared the Bill have apparently been unable to devise a recital in the preamble which might have purported to justify a gigantic confiscation. At present London is at least as well governed as any great town in the civilized world. Under a Municipal Corporation experience alone will show whether it can be governed with efficiency and safety.

GERMANY.

THE Emperor WILLIAM has opened the Session of the German Parliament with a speech which sufficiently indicates the exceptional position he holds among European sovereigns. He has a Parliament to address, and has thus to bring the more important features of his policy to the notice of the world; whereas his neighbour the CZAR does what he pleases, without any one knowing what he is doing or going to do. The German EMPEROR speaks in the name of a nation powerful, triumphant, and free from pecuniary embarrassment; and is thus distinguished from the rulers of Austria, France, and Italy. He can announce that a number of measures, all of the highest importance and all carefully prepared, will be brought forward in the same Session with a reasonable prospect of carrying them; and this is what no English Ministry could advise the QUEEN to do without incurring the risk of ignominious failure. The military system of Germany is to be recast; and at the same time, the gigantic task of establishing one judicial system and one code of laws throughout the German Empire is to be taken in hand. More men to serve, and more money to spend, is the demand of those who wield the huge military system which has won Germany so much, and is now to be perfected so that she may keep what she has won. Germans are so accustomed to look to the State as directing them, embodying their wishes, and measuring their needs, that there might perhaps in any case have been no great difficulty in persuading the representatives of the nation to give the Government the men and the money it needs for military purposes. But, fortunately for the EMPEROR and his Ministers, he has, at the crisis when this demand is made, found the best and most useful allies he could wish for in the conductors of a large section of the French press. They think it prudent to irritate Germany by the expression of constant suspicions and unwavering enmity, and so bring home to the German mind the necessity of taking in time of peace every possible precaution against disaster in war. The EMPEROR could safely say that he desired nothing but peace, and that his Government would not take any notice of French hostility until it proceeded from words to deeds. The desire of the German nation for peace is perfectly sincere, and there is as little as possible in Germany of the passion for mere military glory. Those, too, who have got all they want in the world are always ready to cry out that to leave things as they are, and to avoid all foolish quarrelling, is the golden rule for men; but with France on one side and Russia on the other, Germany feels much anxiety, and knows that she cannot

afford to let the moment come when she could be taken off her guard. To belong to such a State in such a position would not seem very desirable to most Englishmen; but it is only fair to view the German system of managing public affairs on its more attractive as well as on its less attractive side. England is the country of individual effort, of free criticism, of half measures, of eternal compromise or postponement. For years we have been talking of a Code, and in a desultory way we have spent a little money and a little time in seeing whether a Code would suit us, until at last all this faint talk has dwindled into Lord MONKIE's ironical suggestion that the real thing to do is to get two amateurs to codify any two of the easiest parts of law they please, and see whether any one will take any notice of their production. The Germans go to work very differently. They set the best lawyers they can get to draft a Code; they submit this draft to representatives of the different classes affected; the Government takes up the result, and submits it as a whole to Parliament. Social Science Congresses fade away entirely out of such a process, but then, on the other hand, a Code is made.

The foolish and wicked lad who attempted to assassinate Prince BISMARCK is now on his trial, and there is no kind of dispute as to the fact that he fired at the PRINCE meaning to kill him, and very nearly succeeded. He thought Prince BISMARCK habitually wore a coat of mail, and that he must therefore fire at the head; he put two bullets into his pistol to make quite sure, and fired when he was separated from the PRINCE by the space of only a step and a half. The proceedings in a criminal trial as conducted in our country always seem strange to those accustomed to a different system, and Germans no doubt would find something or other a little ridiculous, if they could ever see a joke, in our mode of trying offenders. We in our turn may be amused at their conception of what it is necessary to state and to prove so that guilt may be brought home to a person accused under such circumstances as KULLMANN. According to the custom in force generally on the Continent, the prosecution thinks it proper to paint and blacken all the past life of the supposed criminal. From his youth upwards KULLMANN is stated to have been revengeful and irreligious. He had indeed attached sufficient value to religion to become a member of a Roman Catholic Society. But then he had, according to the prosecution, a secret and carnal object in this. It is probable, the indictment asserts, that he joined the Society in order to procure cheap and good cigars. We are lost in wonder and delight at this suggestion. So this is the way that the crafty Jesuits work! Heaven and good tobacco is the attractive programme they offer to their votaries. Fancy Mr. NEWDEGATE's consternation when he finds that, wide awake as he is, he has tried all these years and never found out the real secret of his enemies. With what a jealous eye he will watch the contents of Lord RIPON's cigar case if he has ever an opportunity of inspecting it. And then the prosecution has the grandest ideas as to what it will prove, so that it may be known how diligent it has been and how beautifully the case has been got up. We learn that a landscape gardener was called to prove that a pistol with two bullets in it was heavily charged. Why was not a butcher called to prove that the friction of the air will not arrest the progress of a ball travelling over a distance of a yard and a half? Then there was a physician who quoted SCHILLER's *Wallenstein*, and proved that KULLMANN's mind was free. But this seems rather dangerous ground, as it might provoke the defence to go into the character of HAMLET. The Bavarians are evidently on their mettle, and are determined to demonstrate that they know how to establish the guilt of an assassin as well as people who are thought greater and wiser. Let us hope that they will succeed, and that they may persuade the great CHANCELLOR that he is as safe at Kissingen as anywhere else.

Count ARNIM has been released from prison, and various interpretations are put upon the event according to the wishes and interests of the interpreters. The solemn official account is that he has been released because his health was so bad that the Government had pity on him. The modified semi-official account is that he has been released because, as all the facts are established, he can now do no harm if he is set at liberty. The account of Count ARNIM's friends is that he has been released because the case of the prosecution has utterly broken down. The whole story of his official conduct and of the treatment he has received is the subject of endless gossip at

Berlin, and newspaper Correspondents send to England the most varying pictures of what has happened, according as the last idle talk they have had has pointed in one way or the other. Fortunately we have at last something better than mere gossip to go upon, if the letters that are said to have passed between the present MINISTER for FOREIGN AFFAIRS and Count ARNIM a month or two ago are genuine. The Minister asked for the missing documents, and the Count replied that he was no longer in the diplomatic service, and if the Minister wanted to get them he must bring a civil action for them. The Minister replied that the Count was still in the diplomatic service, as he was drawing his pension, and had never received the EMPEROR'S permission to retire, and that it was not a civil action, but criminal proceedings, to which the Count was exposed if he persisted in his refusal to give the documents up. The Count answered that he would not give them up, that he had nothing to do with the diplomatic service, and that he would abide the judgment of a civil, or, if necessary, of a criminal, tribunal. The Minister on this set the requisite machinery for criminal proceedings in motion, and then the court of law acted in regard to Count ARNIM as it would have acted towards any one else. In one sense this is probably true. Supposing it had not been documents, but some simple article of value, like plate, that the Count had carried off when he had been entrusted with it by the State, the court would have done, we may suppose, just what it has done. It would, on *prima facie* evidence being submitted to it, have arrested him and had his house searched; and, technically, a piece of paper carried off is as much an article of value as a fork or a spoon. The question is thrown back; and we have to ask whether it was wise and fair in the MINISTER for FOREIGN AFFAIRS, knowing what the action of the courts would be, to treat the detention of Prince BISMARCK'S letters to Count ARNIM on the same footing as the abstraction of a spoon. There are two ways of answering this. In England we should have been inclined to hush such a thing up; we should not have believed that a nobleman who had filled high offices had meant to do anything very wrong when he refused to give up letters which it may be assumed he ought to have given up. We should not like to see such a man treated like a thief or a burglar. But then in England we consider an Ambassador rather as an individual than as part of a system. He is a nobleman who is willing to accept a mission. In Germany, on the other hand, there is a great system of State service, and every member of the service is bound rigidly by its rules, and is looked on as a part of a whole. To keep this organization together it is necessary to enforce discipline from top to bottom. Count ARNIM, if he abstracts documents, is exactly in the same position as a clerk who abstracts them. The Regulations of our army require an officer to be brought to a court-martial just as much as a private soldier if he is guilty of certain offences, and the civil service of Germany is organized on much the same basis as our military service. According to this view, the Minister was bound to prosecute Count ARNIM if under the same circumstances he would have prosecuted a clerk. This reasoning appears to have convinced many Germans who at first were inclined to think that Count ARNIM had been very harshly treated. But there are still many Germans who do not know exactly what to say when they hear this reasoning, but who think that really Count ARNIM is not at all like a clerk; and so their minds lean to his side, and, without exactly saying that he ought to have had favour shown him, they pick up all the gossip they can find in order to show that he has suffered unnecessary hardship.

THE TWO LAW OFFICERS.

TWO Law Officers, one of the late and one of the present Government, have been enlightening their constituents on current politics. One was discursive, the other concentrated. Sir HENRY JAMES reviewed for the benefit of Taunton the general position and prospects of the Liberal party; Sir JOHN HOLKER kept the attention of Preston exclusively fixed on the one vital and truly Conservative question of beer; and each was excellent in his way. The late Attorney-General attacked his enemies, advised his friends, and instructed his party in his usual graphic and sparkling style; and as to beer, it may be safely said that there never was such a very beery Law Officer as the present SOLICITOR-GENERAL. It cannot be denied that Sir

HENRY JAMES had something practical and definite to say to Liberals generally. His advice to them, in fact, amounted to this—Abuse the Conservatives through thick and thin, watch them as cats watch mice, avoid burning questions, and stick to Mr. GLADSTONE. He put this advice in every kind of shape, reiterated it, and illustrated it abundantly. A Taunton elector might well have said to himself that it was all very well saying that the Conservatives must be abused, but that he did not see how he was to begin. Sir HENRY JAMES came to his aid, and showed him how easy it is, if people did but understand the art, to abuse political enemies. There was, for instance, the Endowed School Bill of last Session. Of course any novice could make a little easy fun of the scrape into which the Government got, and of the strange way in which Mr. DISRAELI extricated himself from it. But an advanced practitioner sees how to go much further than this. He perceives that the Conservatives ought to be abused for the gross inconsistency they display. They pretend great reverence for the intentions of founders, and yet they refuse to see that the founders of many schools were distinctly Protestant persons, and that they would really have been delighted to extend the benefits of their institutions to such eminently Protestant people as the present Nonconformists. This is the kind of inconsistency for which any amount of abuse may be properly showered on the Conservatives. Certainly the abused Conservatives might reply that what they are asked to do is not to open the endowed schools to Protestant Nonconformists only, but also to those very Catholics whom the founders left their wealth to combat. But this is a small detail, and one of the sovereign maxims of genuine abuse is never to go into pettifoggish minutiae. Then the Conservatives are to be watched, and the question might be raised in what spirit and to what extent are they to be watched? Can they never be trusted to do the least thing right? Never, is the short and simple answer of Sir HENRY JAMES. They are so desperately perverse by nature that the trail of the serpent is to be found in the tiniest of their performances. They would be sure to shape even a Turnpike Bill so as to favour secretly some jobbing class, unless Liberals like Sir HENRY JAMES were ever reading between the lines of their dangerous and insidious phrases. But even the most abusive and watchful party wants a leader; and Sir HENRY JAMES emphatically warned Liberals generally that they had only one thing to do, and that is to cast themselves without reserve at the feet of Mr. GLADSTONE. Last Session there were painful discussions as to who was to replace Mr. GLADSTONE if he would insist on always staying in Wales and thinking of nothing but HOMER. There was even a bitter and audacious attack made on Mr. GLADSTONE by one of his late subordinates. Now Sir HENRY JAMES is very fond of Sir WILLIAM HARCOURT, and admires him very much. But what is the use of any Liberal going out to fight on his own behalf, and slashing friends as well as foes? The Greeks could do nothing while ACHILLES stayed in his tents; and the Liberals in their present distressing position cannot do nearly as much good by sallying out independently to emulate the renown and repeat the failures of AGAMEMNON as by uniting to coax their great leader to smite the Trojans, as he only can smite them, or, in Parliamentary language, "to fulfil the duties of the "leader of a Liberal Opposition."

Important, however, as all these things are, there is one thing more important still. Burning questions must be deliberately and anxiously avoided. Abuse, and watching, and sticking to Mr. GLADSTONE will be all in vain if Liberals persist in taking up vague and wild schemes of change for which the country is not at all prepared. But then it must be owned that there is an extreme section of the Liberal party which is mad about such schemes, and threatens to withdraw its support from all Liberals who will not join it. What is to be done with such people? Sir HENRY JAMES has evidently thought carefully over a question which is a very interesting one to most Liberal members with a somewhat precarious seat. His answer is that the first thing is to have courage to refuse to be dictated to, and to lose an election rather than sacrifice reputation and conscience to win a passing popularity. And he is perfectly entitled to adopt this tone, as he gave a most creditable example of such courage during his severe fight in the autumn of last year, when he declined altogether to bow to the pretensions of a noisy clique, although the contest was so close that it seemed as if to offend this clique

might entail a defeat mortifying to him and damaging to the Government. But courage is not all that Sir HENRY JAMES has to offer—he has also ingenuity. He thinks he sees how burning questions may be made safe and comfortable. His plan is to try to convince Liberals of the more violent and impatient sort that their true policy is to wait. He is with them, but he is their kind and wise friend. Take, for example, such a subject as the extension of the county franchise. Theoretically, he is quite in favour of the change, but he invites too ardent partisans to reflect on the consequences of making the change too hastily. The agricultural population is densely ignorant and abjectly dependent. It would be the fool of the landlord and the employer. If a million more voters are added to the electoral body, there must be a general revision of the constituencies. An enlightened borough like Taunton, which now returns two Liberals, would be then made part of a huge constituency, which would inevitably return one Conservative. This is undeniably true, as the experience of France under the late Empire may show, for there the Liberalism of the towns was successfully crushed by swamping them in rural constituencies. Sir HENRY JAMES advises the people of Taunton to reply to agitators for the extension of the franchise that they are quite ready to be swamped, only that they prefer waiting until the constituency in which they are swamped is likely to be as liberal as they are themselves. In the same way most of the hot coals can be taken, by a little judicious treatment, out of the burning question of Church disestablishment. To zealots who stir this question prematurely the right reply, according to Sir HENRY JAMES, is that how and when to act is a matter of policy, not of principle. Attack the Church now, and failure is unavoidable. Wait, give the Church plenty of rope, and she will hang herself to a certainty. Thus Liberals of all shades may be brought to work together in harmony. To the advanced section who wish to deal the Church a deathblow the moderate section will answer that this is really unnecessary, that they have begun paying out the rope, and the Church has begun to fit it round her neck. Why should good friends quarrel because a person they all want to get rid of is left to commit suicide instead of being murdered?

There is a kind of dreamy indolent pleasure in turning from such high and difficult and vexatious matters and getting away to the simple theme of Sir JOHN HOLKER and beer. The great want of the Licensed Victuallers has hitherto been the advocacy of some man in a respectable position who thoroughly and heartily believed in them, saw with their eyes, and reasoned after the fashion of the inmost working of their minds. Beer may be looked on in so many ways—as a temptation to evil, as the source of crime, as an instrument of innocent refreshment, as a necessity of the working-man, as the secret of British strength. To publicans these are all flowers of speech, ugly flowers or beautiful as may be, but still foolish decorations of rhetoric. To them beer is none of these things; it is an interest. They have put their money into the trade, and they want to live by it. That is their simple view, and at last they have got a live SOLICITOR-GENERAL to vow that it is his view too. The more beer that is sold the more Licensed Victuallers live in honourable and well-earned comfort. When it is remembered what a vast capital is engaged in the trade, what a number of attractive and even splendid establishments are thus opened to high and low through the length and breadth of the land, and how many numerous, interesting, and respectable families thrive on the profits, the publicans and Sir JOHN HOLKER can scarcely contain the modest pride which swells their exulting bosoms. There is, indeed, but one drawback to their happiness. They live in a world where everything good and great is misunderstood. One of the most dreadful pieces of injustice done to the publicans is the supposition that they wish people to get drunk. There could not be a more egregious fallacy. There is nothing that these high-minded men detest more than drunkenness. It cannot be any pleasure to them to have noisy, quarrelsome persons reeling about their premises, the police interfering, and their licences endangered. They wish nothing of the sort. All they ask is that the public which they exist to please will visit them and spend as much money at their establishments as is consistent with the purchaser's being able to walk away quietly afterwards and giving no trouble. Far from the publicans desiring to see drunkenness, a whole population just not drunk is their ideal. Nor is it to be supposed, as the SOLICITOR-

GENERAL points out, that the publicans have any objection to their customers elevating their moral nature. They do not say that there shall be nothing in life but beer, nothing to raise mankind, nothing to restrain the weak from passing the limits of sobriety. The SOLICITOR-GENERAL more especially has anxiously revolved the question—to which benevolent and philanthropic people like the Licensed Victuallers cannot be dead—how beer-drinkers are to be improved, enabled to judge accurately what they can really stand, and led to love decency and all virtue. The conclusion at which he has arrived is that the true way to effect this great end is to develop in the minds of beer-drinkers a concurrent passion for cricket and billiards. With cricket in the morning, billiards in the evening, and moderate liquid refreshment all the time, a beer-drinker may go to bed with the comfortable reflection that he has honestly done his best, and the beer-seller may take some gentle credit to himself for having opened up the possibility of such an existence to a fellow-man. Such is the picture—the very pleasing picture—which the SOLICITOR-GENERAL draws of the aims, the importance, and the usefulness of the great body with whom and for whom he speaks. Even his critics—for it is scarcely to be hoped that he will altogether escape criticism—must allow that he has rendered them an unquestionable service. The first thing in criticism is to understand what those criticized really think and mean, and now no impartial person can deny that at last he understands the very nature of Licensed Victuallers.

THE BRUSSELS CONFERENCE.

A VOLUMINOUS Supplement to the *London Gazette* of October 23 contains the discussions and the final Protocol of the Brussels Conference. At the first meeting the Delegates resolved that no conclusions except those which might be unanimously adopted should be recorded in the Protocols; but it was soon found that adherence to the rule would leave the records of the Conference a blank. Accordingly, the discussions have been published, and they are reproduced in the Supplement to the *Gazette*. Lord DERBY has probably exercised a sound discretion in leaving them in the original French, though it might be plausibly argued that papers which are worth publishing are also worth translating. Only the most curious and most industrious inquirers will study in detail conversations which had little practical result, although they were sometimes not wanting in animation. The substance of the debates is sufficiently stated in Sir A. HOLLAND'S Report, and it will excite little interest. The conduct of the English Delegate seems fully to have justified the choice of the Government, though it would have been difficult for an officer of intelligence and prudence to commit his country to any of the decisions of the Conference in the face of Lord DERBY'S repeated and explicit protests. The correspondence on the subject begins with a declaration that the QUEEN'S Government will neither discuss the rules of international law nor undertake any new obligations, and that they will not even send a delegate to the Conference except on a distinct understanding that nothing shall be said about maritime warfare. Their agent was expressly prohibited from agreeing to any resolution, except for the purpose of referring it to his Government. Finally Lord DERBY after the close of the Conference formally intimated to all the Governments which had been represented at Brussels that his Government does not endorse (*sic*) any of the conflicting opinions expressed at the Conference, or accept the Rules annexed to the Protocol. The Rules themselves make no change in the recognized usages of war; but it is as well to disclaim the authority of any Conference to modify by statutory legislation the common law of nations. After the experience of the Treaty of Washington and its results, no English Minister will for some time to come agree to newfangled rules which may be applied to the purposes of a litigious adversary.

As the greater part of the topics submitted to the Conference related to invasion, it may be hoped that the subject will in the future as in the past have little bearing on English interests. The representatives of the smaller Powers were not unnaturally alarmed by proposals on the part of Russia and Germany which seemed to limit the right of defence. General VOIGTS RHEITZ, who took a principal part in the discussion, plausibly contended that it was for the interest of the weaker as well as of the stronger

party that war should on both sides be conducted regularly, and under proper authority; but Belgium, Holland, and Switzerland were well aware that invasions are necessarily conducted by regular armies, while a defence by popular levies can scarcely be regulated by immutable rules. It is admitted on all hands that some kind of military organization is necessary to entitle volunteer bands to the rights of belligerents; nor is it desirable to encourage isolated acts of violence against even an invading enemy. General VOIGTS RHETZ demanded only a visible badge in place of uniform, and that the troops should be commanded by some military or civil officer acting under instructions from head-quarters. In the Resolution as it was finally adopted the further provision was inserted that the population of a non-occupied territory which had taken up arms without having had time for organization should be regarded as belligerents if they conformed to the laws and usages of war. When the case arises, invaders and invaded will take equally little account of the opinions of the Brussels Conference. For their own sakes the commanders of volunteers will establish some kind of discipline, and, if possible, they will provide a substitute for a uniform. In April 1848 the Provisional Government of France reviewed in the Champs Elysées three or four hundred thousand armed men, of whom not a tenth part wore any kind of uniform. If an enemy had at that time marched upon Paris, it would have been evidently impossible to treat National Guards who might have been made prisoners as irregular marauders.

Some discussion arose on the definition of a fortress, and an attempt was made to draw a distinction between a town defended by detached forts and a place enclosed by a continuous circuit of wall. As might have been expected, the German Delegate declined to allow an exception which would in 1871 have secured Paris against the risk of bombardment. It was eventually declared that towns which are open and undefended are not liable to bombardment, and the Delegates might have added that no commanding officer would be likely to expend his ammunition on a town which offered no impediment to the entrance of his troops. A town or a village which is unfortunate enough to be included in a military position must of course incur the penalty of attack as well as of defence. The declaration that a town taken by storm ought not to be given up to plunder records a recent advance in the humanity of belligerents. Spies are hereafter, as at present, declared liable to be shot if they are caught, although they are not liable to any punishment if they are taken prisoners when they have accomplished their mission and rejoined the ranks of their own army. The original proposal of the Russian Government that inhabitants of an occupied territory giving information to their own Government should be treated as spies was expunged by unanimous consent. For other purposes it was found both expedient and difficult to define the precise meaning of occupation. General VOIGTS RHETZ was of opinion that a territory might be occupied by flying columns, and he denied the analogy of military occupation to maritime blockade. According to the original project, the inhabitants of occupied districts who should voluntarily rise against the invader were to be treated as criminals; but the Netherlands Delegate, while he admitted that an invader would sometimes treat insurgents with severity, "repudiated the idea of any Government contemplating delivering over in advance to the justice of the enemy those men who, from patriotic motives and at their own risk, expose themselves to all the dangers consequent on a rising." Baron LAMBERMONT of Belgium added that, if citizens were to be sacrificed for attempting to defend their country, "they need not find inscribed on the post at the foot of which they are to be shot, the Article of a Treaty signed by their own Government, which had in advance condemned them to death." If any English insurgent against a foreign enemy should find himself in that unhappy condition, the document inscribed on the post at the foot of which he is to be shot, ought also to record that Lord DERBY and his countrymen are not in the smallest degree bound by even the modified provisions which were included in the Protocol.

Private property is to be nominally respected, and it is with admirable vagueness provided that "the enemy will demand from local authorities or from the inhabitants only such payments and services as are connected with the necessities of war generally acknowledged in proportion to the resources of the country." NAPOLEON and

his Marshals exacted only such payments as were, in their judgment, connected with the necessities of war; and the result was that the inhabitants of the countries which they occupied generally bore the whole cost of the invading army, with a few millions for the private purses of the superior officers, and equal or greater contributions to the military treasury of the EMPEROR. When the Delegates came to the question of reprisals, the conventional deference which every State expressed for the wishes of any other State broke hopelessly down. As Sir ALFRED HORSFORD remarks, instances of severe reprisals were too recent to permit a dispassionate consideration of the question. The Russian Delegate could only express a too sanguine hope that "the mere mention in the Protocol that the Committee, after having endeavoured to regulate, to soften, and to restrain reprisals, has shrunk from the task before the general repugnance felt to the subject, will have a most serious moral bearing." It was not exactly from repugnance to reprisals that the Committee of Conference shrunk from discussing the subject; but Baron JOMINI, who is the most courteous and conciliatory of diplomatists, deserves credit for extemporizing an excuse for inevitable failure. As no one is bound to conclusions which are in themselves for the most part unobjectionable and exempt from all suspicion of novelty, the Conference will have done no harm. The motives of the Emperor ALEXANDER in convoking the Conference were probably benevolent, and, if no progress has been made towards mitigating the evils of war, some moral effect may perhaps, as Baron JOMINI hopes, be produced by the general acknowledgment that, although the sole object of war is to hurt and distress the adverse belligerent, yet the infliction of the greatest possible pain and misery is not in itself a desirable object.

SOCIALIST AGITATORS.

WHEN the Suffolk farmers first accepted the challenge of the Labourers' Trades Union, volunteer advisers told them that they were mad, or exhorted them to increase the scanty wages of their men, instead of driving them to despair. The agitation which was checked by the firmness of the farmers in the Eastern Counties has lately been revived in Somersetshire with less concealment of its real purpose. Noisy demagogues and revolutionary pedants now demand on behalf of farm-labourers, not an addition to their wages, but a redistribution of landed property. A Dissenting preacher who presided at a late meeting at Wellington quoted with professional familiarity the precedent of the Mosaic year of jubilee as applicable to the soil of England. As landed property was certainly hereditary among the Israelites, they can scarcely have conformed in practice to the injunction which certainly seems to be found in their law; but during the Reign of Terror a Jacobin judge is said to have decided an action of ejectment in favour of the plaintiff on the express ground that the defendant had proved the undisputed possession of the land by his ancestors during several generations. The Court ruled that the owner had held the land long enough; and that now it was the turn of the claimant. The Somersetshire preacher would act on the same principle with the apocryphal Jacobin in the story. It is not worth while to argue with a teacher who may or may not believe the doctrine which he at least thinks good enough for an ignorant audience. One of the advantages of a voluntary ecclesiastical system is total absence of responsibility. Even if farmers were otherwise likely to be convinced of the expediency of giving more than the market price for labour, they would see the impossibility of conciliating demagogues and dupes who claim a right neither to large wages nor to occupancy, but to the ownership of the land. The statistics which are commonly produced by agitators, though they may not be intelligible to labourers, probably produce an effect by the long array of figures. It is said that a hundred and fifty persons own half the soil of England; in which case their possessions must average considerably more than two hundred thousand acres. A hundred and fifty estates of such magnitude would not be easily enumerated in detail. It is next asserted that railways have added 800,000,000*l.* to the value of land in England, or 400,000,000*l.* to the property of the hundred and fifty monopolists. This unearned increment, as Mr. MILL called it, ought obviously to be confiscated, perhaps in au-

ticipation of the jubilee year which will transfer the residue to the defrauded labourer. In pursuance of the same mode, of reasoning it might be shown that the increase in the value of investments and in the profits of trade which may be traced to the extension of population and industry belongs to anybody rather than to the actual holders. The funds are now worth thirty or forty per cent. more than in the early part of the century.

Mr. FRANCIS NEWMAN, in an argument for the equalization of the county and borough franchise, virtually recommended the labourers to use the suffrage, as soon as they obtained it, for purposes of spoliation and revenge. English Parliaments had, he assured them, always been hostile to the labourer, as was proved by the Acts which purported to establish a maximum of wages. It was unnecessary to remind the workmen that no such Acts had been passed or enforced for many generations; and it would perhaps have been superfluous as well as difficult to prove that modern Parliaments had exhibited any hostility to the poor. It is a favourite device of agitators to attribute to the objects of their denunciation all the offences which may at any former time have been committed, or said to have been committed, by the class to which they belong. Nobles were massacred during the French Revolution because, amongst other reasons, their enemies had invented a legend in which feudal lords were represented as having in the middle ages warmed their feet in the blood of their murdered vassals. Mr. NEWMAN, though he resembles in many respects the logical and philanthropic section of the Jacobins, has probably no wish to send landowners to the guillotine. He only explains to the Somersetshire labourers that down to the time of HENRY VIII. they were called landlords, and that at that date they became landowners by conquering the villeins, whom they sometimes hanged by a hundred at a time. Mr. NEWMAN adds that it is a happy incident of the present agitation that it has never been proposed to take property from the landlords. "What remedy is to be supplied is a matter for mature reflection." Possibly even the intellect of a discontented labourer may have suggested, with little need of reflection, that the remedy for unjust deprivation of property is to take it back again by force. If the villeins were, as Mr. NEWMAN asserts, conquered by the great lords, who thus dispossessed the peasantry from their holdings, the peasantry have only with the aid of the franchise to conquer the lords in turn, and so to recover their holdings. It is true that with few exceptions the landowners of the present day have neither conquered nor dispossessed anybody, except by the simple process of buying his land with the earnings of themselves or their predecessors. Historical politicians of the school of Mr. NEWMAN are always ready to visit the sins of the fathers, not only on their children, but on the assignees for valuable consideration of a long succession of previous purchasers from their children.

It may be well to recall attention to the professed purpose of Mr. NEWMAN's elaborate dissertation on landed property. Nothing can be more reasonable than to support a demand for the extension of the suffrage by an exposition of the political results which it is expected to produce. Mr. NEWMAN and the other speakers at the Wellington meeting are entitled to the credit of candour, if not of prudence, when they explain that the political power which they ask for the labourer is to be employed in expropriating the present owners of the land. It is true that some of the orators affect to disguise from others, and perhaps from themselves, the only intelligible meaning of their declamation; but they all concur in assuring the labourer that he has been unjustly dispossessed of the soil of which he is the rightful owner. The grievance can only be redressed by simple restoration. It is idle to speak of compensation to be paid by penniless claimants. In Prussia and in Russia, which are always invidiously held up for the imitation of English legislators, the peasantry were, before the modern changes in the law, already in possession of the land which they now possess; and it only remained to relieve them from the incidents of a servile tenure. In England small freeholders have been bought out, and small purchasers have been outbidden. The natural effect of freedom of trade in any commodity is to accumulate objects of luxury in the hands of the rich. If the Wellington doctrines of transfer were carried out in practice, some families would be found to have made the best of both the present and the feudal time. In every county names which indicate former ownership of the

land are to be found among the labouring class, while the neighbouring squire is probably the descendant of a trader whose ancestors may have been numbered among Mr. NEWMAN'S dispossessed villeins. The extravagant proposals of demagogues in the rural districts will not be without incidental advantage, if their language induces politicians seriously to consider the project of extending household suffrage to county constituencies. Mr. GLADSTONE adopted the popular doctrine with characteristic levity; and Mr. DISRAELI has sometimes countenanced it with a not less characteristic affectation of confidence in the working class. Mr. GLADSTONE would perhaps not have menaced the stability of the Constitution if he had not happened at the moment to want an excuse for his conversion to the Ballot. Mr. DISRAELI believes that he proved his sagacity when he taught his party that it was for its interest to dig down to a stratum of voters which would, as he assured them, be Conservative. The tone of his speech on Mr. TERVELLYAN'S motion in the last Session indicated a disposition to repeat the experiment, if only he could ensure the assent of his colleagues and his party. The stratum in which the doctrines of Mr. NEWMAN and his friends have been deposited is not likely, when it is brought to the surface, to produce Conservative vegetation. The managers of the Union, the rural agitators, and the Socialist professors give Parliament fair warning of the objects to which they will direct the political energies of the enfranchised labourers. The landowners and the farmers are thoroughly aroused, and they will not readily forgive any attempt to place them at the mercy of the demagogues who expound their policy not only in mischievous speeches but in incendiary caricatures. If the owners of personalty connive at the confiscation of the land, they will be justly and inevitably punished by the application to their own possessions of Socialist principles.

NANA SAHIB.

IF it should turn out after all, as seems not improbable, that the NANA SAHIB who has been captured by SCINDIAH is not the real NANA, or at least that there is no certainty of his being so, there will be no reason to regret that the British Government has been thus conveniently relieved from a painful and embarrassing responsibility. It will be observed that the very positive assertions of the first telegram have been gradually toned down in subsequent communications. At first it was taken for granted that this man must necessarily be the NANA, and that there was no room for any sort of doubt on the subject. It now appears that all that can be said is that somebody has been seized on the assumption that he is NANA SAHIB, and that, while several persons who have seen him and who knew the NANA think he really is the man, others think he is not. It has been remarked that there is something singularly dramatic in the capture by a native prince, who has at the present moment special reasons for showing himself friendly to England, of another prince who has made himself the most notorious embodiment of hatred to our rule; but to some minds the striking poetical appropriateness of the incident may tend rather to confirm than to remove the doubts which have been suggested. The first report was that SCINDIAH had himself recognized the NANA and seized him with his own hand, and that the prisoner had immediately confessed his name. A later message tells us that the prisoner has repudiated his confession as having been obtained under the influence of hunger and drugs. We also learn that the doctors differ as to his age, some holding that he is under forty and others that he is over that age; that Dr. TRESSIDER, the Civil surgeon at Cawnpore during the Mutiny, who attended the NANA, and once performed an operation on his foot, fails to identify him; and that Colonel M. THOMPSON, who was also well acquainted with the NANA'S appearance, though he sees a general likeness, including a scar on the forehead, does not feel sure that he is the right man. On the other hand, SCINDIAH adheres to his opinion; a nephew, and another man who is oddly described as "the father of the man who married the daughter of the NANA'S adoptive father," have borne testimony on the same side; and certain Mahratta witnesses, not particularly specified, are said to have seen him after he was shaved and dressed, and to be confident of his identity. When there is such a conflict of opinion, it will certainly not be surprising if the prisoner should be ultimately released.

It would of course be hopeless for any one at a distance to attempt to solve a problem of this kind. We can only accept on trust the judgment of those who are supposed to be most capable of forming one. It is obvious, however, that the question is clearly not one to be determined by a mere numerical majority of witnesses, inasmuch as the testimony of a single thoroughly independent and competent witness might justly outweigh that of a score of others of a less trustworthy character. We have lately witnessed in our own country an instructive example of the liability of intelligent and conscientious witnesses to fall into strange confusion and inaccuracy in giving evidence on a question of personal resemblance when there has been a long interval during which the person to be identified has not been seen. It is now ten years since the NANA disappeared, and it may be presumed that his experiences during that time, if he is still alive, have left their mark upon his looks. There is no reason to suppose that SCINDIAH is capable of deliberately passing off a false NANA on the British Government as a means of paying court to it; but nothing is more likely than that it should be known that he would be glad if the NANA could be found, and that his dependents should endeavour to gratify his wish. It would appear that there is certainly a resemblance, and perhaps a strong resemblance, between the prisoner and NANA SAHIB. Indeed the man himself says that he was arrested on a similar suspicion in 1864, and acquitted. This acquittal, supposing the man to be the same, would of course prove nothing except that the authorities at that time did not feel certain that he was the NANA, and the second question of identity thus opened up would probably be at least as difficult to determine as the first. As the matter stands there would seem to be very little chance of the question being decided either one way or the other in such manner as to put an end to controversy. Some years ago a circumstantial account of the NANA's death from jungle fever was accepted at Calcutta as authentic. If the present presumed NANA were to be executed, there would be many people who would believe that the penalty had been inflicted on the wrong man, and that the real NANA was still alive.

Under those circumstances there can, we should think, be little doubt as to the course which the Government will pursue. If it is proved by overwhelming evidence that the NANA has actually been caught, there will, we suppose, be no alternative but to hang him, but it will certainly be a relief, and not a disappointment, if it should happen that the unwelcome captive cannot be identified. It is not surprising that SCINDIAH should take the view of the matter which would naturally present itself to the mind of a native prince. He would imagine that nothing could be more gratifying to the British Government than to get hold of its old enemy for the purposes of vengeance; and though he is said to have begged that the prisoner's life may be spared, he has probably done so with little expectation that this clemency will be displayed. Englishmen, however, have a different way of looking at such questions. It is true that some English journalists seized upon the first intimation of the capture as an excuse for raking up the horrible memories of Cawnpore, and gloating over the opportunity for revenge which has now offered; but, in striking this note, they strangely misrepresented the feelings of their countrymen. It would of course be absurd to waste any pity on the NANA. What he did is registered indelibly, and can never be forgotten; but the page is one on which Englishmen do not care to dwell. The terrible anguish of the hour has been softened by time into a mournful memory, and NANA SAHIB himself may be said to have taken his place among the shadows of history. If he is still alive, and actually in our hands, the law must take its course. But his execution, though due to the law, would be a miserable satisfaction to those whom he wronged. Our account with him has long ago been closed, and practically he may be regarded as having ceased to exist when the Mutiny was suppressed. If his life is further prolonged, it will be only on the same conditions as those on which he has enjoyed that doubtful boon during the last ten years. He can live only by renouncing everything that makes life worth having. He must skulk, and hide, and burrow like a hunted beast, knowing at every moment that his life is at the mercy of those who shelter him. It is true, that the security he has hitherto enjoyed proves the connivance of friends, but there is no evidence that this connivance is general. Indeed, the very completeness with which the secret has been kept suggests

that it must have been known only to a few. To hang the NANA now would be almost like hanging a ghost, without having power to lay it. The official attestation of his death would not remove the doubts of sceptics as to the identity of the victim; and, on the other hand, even if he lived a little longer, his existence, as he must remain invisible, would be only a sort of legend. On the whole, it may be thought that it would have been just as well if SCINDIAH had held his hand. The most convenient issue of the affair will be the discovery that the captive is not the NANA, but only some unfortunate creature with an awkward resemblance to him.

FRANCE.

PRINCE NAPOLEON has again performed his favourite feat of posing as the democratic member of a despotic house. He has favoured the electors of the canton of Ajaccio with an exposition of the views which separate him from the other branch of his family, and which will continue to separate him from them until such time as a reconciliation promises to be convenient. It is well that cousins should dwell together in unity when one is in power, and the other finds the relationship profitable; but when both are, politically speaking, in exile, there may be an advantage in their appealing to supporters of different opinions. Prince NAPOLEON has discovered that the Napoleonic tradition has two sides to it. The Empire was at once a dictatorship and an emancipation. In the former character its mission was to secure in France and Europe the conquests of the Revolution. In the latter character its principal object was to give Prince NAPOLEON opportunities of distinguishing himself. The enfranchisement of Italy, the annexation of Nice and Savoy, the adoption of Free-trade, the Workmen's Commissions, and a project of decentralization which we hear of for the first time, were the results of a policy which Prince NAPOLEON recommended and with which Prince NAPOLEON associated himself. In so far as the Empire kept on good terms with its guardian angel all went well. Unfortunately the late EMPEROR did not always listen to these gentle promptings. There were other parts of his administration to which Prince NAPOLEON had to offer a strenuous, though, as it appeared to outside observers, a discriminating, opposition. He was the constant adversary of official candidatureship. He had no hand in the persecutions which made the Empire so many enemies. He resisted the wavering and fatal policy which led French troops to Mexico and Montana. He was opposed to the war of 1870. Nothing that the late EMPEROR did against Prince NAPOLEON's wishes ever prospered. Nothing that he did under his advice ever failed.

Under these circumstances it was natural that when the EMPEROR died Prince NAPOLEON should have expected to be summoned to Chislehurst to be guide, philosopher, and friend to the PRINCE IMPERIAL. Instead of this, he found that his cousin remained in the hands of the same bad counsellors who had led his father to ruin. The Imperialist leaders, he says, dream only of reaction and proscription. They are no better than Legitimists, without the White Flag. They are the slaves of Clericalism abroad and at home. The system they desire to restore is the system of the BOURBONS. This last accusation seems a little unfair, for the BOURBONS, judging by the acts of their adherents since they have been in office, have done their best to restore the system of the Empire. Possibly, however, the object of bringing these charges is to impress the Legitimists with a conviction that there is a substantial likeness between them and the Bonapartists, and that they will consequently do well, when they have no candidate of their own, to give their votes to an Imperialist. There is no need to suspect Prince NAPOLEON of anything more than a qualified dislike of his cousin. He is probably equally willing to take advantage of him when he has the opportunity, and to do him a good turn whenever the doing of it involves no loss to himself. In this case, as he cannot hope to win over the Legitimists for himself, it may be as well if possible to secure their votes for the family. Meanwhile it is the PRINCE's business to catch Republican votes, and accordingly he winds up his address by an enumeration of the democratic reforms which he will introduce if ever he has the chance. Tranquillity at home and peace abroad, the work of 1789 carried on to perfection, a remodelling of laws and institutions in the interest of democracy, army reorganization, rearrangement of taxation so as to please the greatest number of taxpayers,

compulsory education, emancipation of communes, Free-trade, liberty of the press, and of association—in short, universal progress and amelioration will accompany Prince NAPOLEON wherever he goes. Here, again, no harm can come to the party from the waving of the democratic flag. Prince NAPOLEON is not a candidate for the throne. As he himself puts it, he has had “too intimate an acquaintance with the grandeurs of power to have any personal ambition left.” As it might be more accurately expressed, he knows too well that succession to the Empire is beyond his reach to make himself unhappy because he cannot enjoy it. Consequently, if he should attract any votes in any constituency by means of this proclamation of his opinions, they must all go to the Imperialist candidate. If Prince NAPOLEON really has the accomplishment of these reforming intentions at heart, he can only carry them out under his cousin's rule. And, in the improbable event of any considerable number of French electors believing in the PRINCE's sincerity, the only obvious means of giving him the requisite opportunities will be to place him in the position of first Prince of the Blood. If, on the other hand, Republican ideas remain in the ascendant, and the PRINCE IMPERIAL is not recalled from England, it will be well for the BONAPARTE family that one of their number should be a candidate for such honours as the Republic will have to bestow. It is on the cards that Prince NAPOLEON, if he talks long enough about universal progress and amelioration, may some day become President in the Radical interest. How could he show a more disinterested regard for his country than by using his term of office to prepare the way for his cousin's restoration? There is not the least chance that the Imperialist party would ever accept Prince NAPOLEON himself as Emperor, and the certainty that he was giving up nothing would greatly sweeten this apparent act of self-denial.

It will be well if the dissensions which have broken out among the Republicans in connexion with the Oise election prove no more serious than the quarrel in the BONAPARTE family is likely to be. At present it seems not unlikely that the rivalry between M. ROUSSELLE and M. LEVAVASSEUR may end by letting in the Duke of MOUCHY. M. ROUSSELLE is willing to retire after the first ballot if M. LEVAVASSEUR gets more votes, but he insists on his right to be accepted as the sole Republican candidate if M. LEVAVASSEUR stands lowest on the poll. In theory this claim is perfectly reasonable. The Republican party is assumed to be divided as to which of its two candidates it would like to see returned, but to be united in the desire to see either of them returned in preference to the Duke of MOUCHY; and in this case the natural course is for the minority to withdraw their candidate in favour of the candidate of the majority. As a matter of fact, however, this is not at all a true description of the feelings of the Republicans. M. ROUSSELLE's partisans would like to see M. LEVAVASSEUR successful if the choice lay between him and the Duke of MOUCHY; but it is by no means clear that M. LEVAVASSEUR's partisans return the compliment. On the contrary, there is great reason to believe that, if M. LEVAVASSEUR were to withdraw after the first ballot, and M. ROUSSELLE and the Duke of MOUCHY were the only candidates in the field, a considerable number of M. LEVAVASSEUR's supporters would go over to the Duke of MOUCHY. It is difficult perhaps for M. ROUSSELLE to realize this fact, and it must be admitted that, so long as it remains a fact, the position of Radical candidates will be an unsatisfactory one. Inevitable self-sacrifice at the last moment, and the feeling that they have let in an adversary, are not a pleasant pair of alternatives to have to choose between. It is possible that, in order to keep alive their disinterestedness, the Radical candidates must occasionally be brought face to face with the consequences of an opposite line of conduct. The extreme Republicans have of late become very much more moderate than they used to be, and this improvement is in part attributable to their experience of the mischief which followed from the return of M. BARODET for Paris. If the Oise election ends in the return of the Duke of MOUCHY, they may learn from defeat the same lesson which they formerly learned from a victory which turned out to be more disastrous than any number of defeats. It will be a remarkable evidence of good sense if M. ROUSSELLE should, after all, retire in favour of M. LEVAVASSEUR; but if he does not, it will be some comfort to reasonable Republicans to reflect that future elections may be determined in their favour by a fresh demonstration that only an extremely Conservative Republic can possibly succeed in France.

IRRIGATION IN INDIA.

THE famine in Bengal has brought into new prominence the difficulties of irrigation, or, to speak more strictly, of paying for irrigation. Sir JOHN STRACHEY has lately described the financial result of the system at present in force, supposing it to be extended with that increased speed which seems now to be demanded by public opinion in India. “The cost of the works now in progress,” he says, “or the construction of which has been sanctioned, can hardly involve us in serious difficulties; but the necessity for protecting the country against famine is so great that it is impossible to say that we ought to be satisfied with the moderate rate of progress which is being made.” Sir JOHN STRACHEY does not question the assumption of the Indian Government that the returns from the works will not only cover the interest on the capital expended, but ultimately repay the capital itself. But though these calculations are correct, “they are only correct with this serious proviso, that a long time will commonly elapse before the anticipated results are obtained.” In proportion as more canals are projected and those already in progress are pushed on more rapidly, this prospect becomes more alarming. The Government may afford to lay out small sums of money for some considerable time, but, as one province of India after another puts in its claim, the interest on the aggregate capital borrowed must become large enough to exercise a very disturbing influence on the Indian Budget. In the three years ending the 31st of December, 1871, the whole revenue of Orissa was spent upon canals, and unless the works themselves can be made to pay the interest on the cost of construction, the Government of India will be burdened with two millions of public debt and an annual payment of 90,000*l.* This is an example of what is done under the pressure of recent terror; and what the famine of 1866 was for Orissa the famine of 1874 will be for Bengal. It is true that a great part of Lower Bengal has an average rainfall which seems to make irrigation a luxury, but last year's experience has shown that a large average rainfall is not a guarantee against famine. If rain is wanting from the 1st of August to the 15th of September, it matters little how much may have fallen during the earlier part of the year. Besides this, the districts which suffered most from drought in 1873 lie outside this comparatively favoured zone, and have an average rainfall which makes irrigation a necessity to the prosperity, if not to the existence, of the people. Wherever this is the case, the Indian Government will be strongly pressed to make canals, not to mention that it will probably feel, with Sir JOHN STRACHEY, that it “is an absolute duty to the people which must be performed whether the financial risk be great or not.” But the financial risk involved in pressing on irrigation works to the utmost possible extent amounts to a choice between bankruptcy and burdensome taxation, and in India burdensome taxation is a source of considerable suffering for the people, and of immense, and possibly dangerous, unpopularity for the Government. This is the difficulty which Indian financiers have now to meet. At present canals are paid for by loans, and if the people for whose benefit the canals have been made would use the water, the price they would pay for it would at least meet the interest on the capital borrowed. But as a matter of fact they do not use the water. The innate conservatism of the Indian peasant, says Dr. HUNTER, gives the canals no chance. He and his fathers have been accustomed to trust to the accidents of successive seasons, to rejoice when rain is abundant and the harvest bounteous, to lie down and die when the earth is dried up and the crops fail. No doubt where irrigation works exist he no longer gives himself up to despair. He turns in his extremity to the canals, and is glad to take the water which he has hitherto despised. But before he yields to this overpowering necessity he has probably been reduced to beggary, if not to starvation. The Land-tax will have to be remitted, relief works must be set up, and in the face of this state of affairs the Government will have to consider by what new tax to raise the interest on the irrigation loan for the years during which the canals lay absolutely unused.

Lord Mayo proposed to solve the problem how to pay for irrigation by levying a compulsory water-rate. The people who are directly benefited by the construction of canals are the people, he argued, who ought to pay for them. At present “everybody seems to desire irrigation, but many

"seem to desire that somebody else should pay for it." If these works are to be steadily gone on with they must be made self-supporting and independent. Without this they will be constantly liable to suspension in deference to some immediate necessity. It is only fair that the cultivators whose lands are improved, and whose lives are saved, by the presence of water in seasons of drought, should bear a burden which after all leaves them richer than it finds them. Sir JOHN STRACHY maintains that, though Lord MAYO's proposal to levy a compulsory water-rate on the lands benefited by the canals has been misunderstood and misrepresented, it was thoroughly just and wise, and that on no other basis can any extensive system of irrigation be constructed. It is not easy indeed to deny this latter statement. The English taxpayer will certainly not make a present of the money to the Indian taxpayer, and all that can be safely and profitably got out of the Indian taxpayer is got out of him already. The Indian Government might conceivably shut its eyes to these two facts, and go on borrowing with no real hope of repaying either capital or interest, but it is practically impossible that such a policy should either find favour at Calcutta, or, even if it did, be sanctioned by the SECRETARY OF STATE. There is a school of Indian politicians who object to a compulsory water-rate, on the double ground that it would be oppressive in itself, and would end by giving the peasantry a distaste for irrigation which would go far to render the works useless. As regards the first plea, it seems to be disposed of by the conditions which Lord MAYO proposed to attach to the rate. On his plan it was not to be levied until the inhabitants had neglected to take the water for five years after it had been brought to their fields, and then only in places "where it can be proved that the cultivator's net profits will be increased by the canal, after paying the irrigation rates." This last proviso must operate as an absolute safeguard against oppression, unless it can be called oppression to make a cultivator do something for the common good, which will at the same time increase his own wealth. Unless it can be shown that he will be a richer man by using the water than by leaving it alone, he will not be forced to pay the water-rate. In this way the peasantry will also be protected against having canals forced upon them by enthusiastic officials. No member of the Indian Government will be allowed to make a hobby of irrigation, so long as his colleagues know that the rate which is to pay for it cannot be raised unless it has been proved that the cultivator will be better off after he has used the water and paid for it than he was before either using it or paying for it.

As regards the objection that a water-rate will set the peasantry against irrigation, two things are to be said. In the first place, this dislike of irrigation is not likely to survive the discovery that they are benefited by it, and they will not be long in making this discovery when they have to pay for the water whether they use it or not. Under a system of voluntary payments, a generation might pass away without the fact finding its way into their minds; under a system of compulsory payments, they may be trusted not to persist in refusing water which it will cost them no more to take than to pass by. In the second place, supposing that a compulsory water-rate even under these conditions would tend to set the peasantry against irrigation, it would not have this effect in nearly the same degree as the additional taxes which will have to be levied if the expense is thrown on the Indian Exchequer instead of being borne by those for whose advantage it is incurred. Observation of results will in time make it clear to the ratepayer that he is a gainer by irrigation. He will see his fields green year after year whether the season be dry or rainy, and he will grow by degrees to understand that his immunity from famine is due to the forethought of the Government. But between an addition to the general taxation of the country and the benefits derived from irrigation there is no obvious connexion, and the peasant who hears that this new burden has been laid upon him for the benefit of a district hundreds of miles away will be a long time in finding out how he is the better for it.

MECHANICAL HUMOUR.

ALL good things are of course speedily imitated; and as competition becomes more intense there is an increasing tendency to rival genuine articles by the cheaper products of machinery. Mr. Ruskin has been driven to a state of permanent irritability by this process as applied to material manufactures. Watt and Arkwright are regarded by him as the tempters who have spoilt our

paradise by their unhallowed arts. Everywhere for the good old homespun work we have flimsy substitutes, artistically contemptible and economically inferior. A similar tendency is manifest even in the fine arts; and we have been told that the remotest colonies are supplied with Titians and Correggios manufactured by wholesale in Birmingham. However this may be, we certainly see symptoms of a similar process applied where at first sight it would seem even less applicable. Literature can be manufactured as well as painting; and, when the art has been developed a little further, we may expect that a publisher will be able to give an order for a volume of *sham* Dickens or Tennyson as easily as the upholsterer can now order paper of any favourite pattern. To some extent the art has always been practised. Every original writer naturally has a band of imitators. Each new poet has a tune of his own, which can be echoed by tenth-rate writers with surprising facility. The mechanical versification of Pope was peculiarly adapted for such servile imitation; but since his metre palled upon the public ear, we have had half-a-dozen new styles, each of which has been caught up with amazing fidelity. A few years ago all young poets echoed Mr. Tennyson; and if at the present moment we were to offer a prize for poetry, we should confidently expect that half the competitors would talk about roses and raptures as fluently, though not quite so melodiously, as Mr. Swinburne. This is inevitable, and to a certain extent is right and proper. No poet has really succeeded until he has established a school; and even the greatest poets have generally begun by treading more or less distinctly in the footsteps of their latest predecessor. It is still an open question whether a second-rate poet has any right to exist at all; but, if the race is not to be exterminated, they must of necessity echo the few original minds which stamp the character of the age.

There is, however, another department of literature in which we are really more annoyed by the process. Of all things, one would say that humour ought to be spontaneous. Nothing jars upon one's nerves so much as a forced laugh; it is not merely tiresome, but positively painful, to see a face contorted into a grin by way of imitating a genuine smile. One reason is that we realize so easily the difference between the sham and the reality. Nobody ever yet succeeded, it is probable, in laughing at a story of which he did not understand the point so skilfully as to deceive the narrator, though that is a harmless little bit of hypocrisy which we all attempt pretty frequently, and which it would be a breach of good manners to expose. No kind of literature, on the same principle, is so unspeakably tiresome as that in which a man without a sense of humour tries to be funny by imitating some favourite form of facetiousness. And yet the attempt is made so frequently and systematically that the performance must evidently be regarded as easy. And, in fact, a joke appears at first sight to be one of those things for which a definite formula can be provided. There is an old book which professes to be a collection of "rules by which a proper judgment of jests may be formed," and to give a criterion for distinguishing genuine from spurious wit. The favourite dispute as to the proper definitions of wit and humour seems to assume that some quasi-mathematical formula of the kind might really be discovered. The simplest of all forms of wit is punning, and one might suppose that the art of punning could be taught like a rule in arithmetic. We do not affect to despise puns, for it would be brutal to find fault with what has been an undoubted amusement to a large part of the human race. So many generations of Englishmen have been delighted by recognizing the fact that the two words "die" and "dye" have the same sound and a different signification that it would be cruel to proscribe so simple an amusement. There are not too many sources of innocent pleasure in the world, and we cannot afford to cut off any one. All that we need say is that the pleasure is of a rather infantile kind; and that, like other infantile games, it loses its charm when deliberately practised by persons of mature intellect. Another and higher form of wit, which seems to be resolvable into a logical formula, is the *hull*; though to make a good *hull* requires very great ingenuity. But when we come to the more refined artifices, where mere logic or language is less concerned, the inferiority of the manufactured to the genuine product becomes more disagreeably manifest. Every true humourist is almost of necessity a mannerist. The peculiar turn of mind to which he owes his power generates a corresponding peculiarity of style; and when the external form is consciously imitated, instead of being spontaneously generated by the mind of the writer, we have the defect which is generally called mannerism. Sterne, for example, or Lamb or Dickens, each invented new and perfectly legitimate forms of humour, which were mechanically repeated by their followers, and, at times, by themselves. Lamb has had fewer imitators than the others, because his humour was the most refined; and any one who tries to follow his method without being guided by his exquisite delicacy of perception becomes instantly and palpably absurd. Such humour cannot be in the least forced without destroying its charm. Humour, on the other hand, like that of Dickens, which is partly the expression of strong animal spirits, and is compatible with the utmost extravagance of language, can be tolerably reproduced by much coarser workmanship; for it implies, when it is genuine, not a delicate balancing of varying intellectual moods, but simply a hearty outburst of unrestrainable fun. Anybody can imitate more or less that kind of humour which in its extreme forms provokes a horse-laugh; but it is not so easy to imitate the fine semi-ironical smile of a cultivated and acute intelligence. The imitators of Dickens, beginning with Dickens himself, have ac-

cordingly been innumerable, and at one time were a real plague of literature. Their methods are too familiar to need description. The short, jerky sentence, the use of preposterous proper names, the incessant dwelling upon some little catchword, the use of an elaborate paraphrase to describe some familiar object, are forms of would-be wit which have long ceased to be tolerable. Who has not shuddered on opening some new book and seeing a tail described as a caudal appendage? Such a phrase is the mark of the beast, and would justify us in sending the book to the common hangman if that person continued to exercise his old function.

Of late years another fashion has prevailed which is already a nuisance in need of suppression. American humour was once a very genuine and characteristic product. The humour, for example, of the *Diglow Papers* was singularly fresh, and has preserved the book in spite of the fact that many of its topics and allusions have already become unintelligible to the English reader. It was a full expression of the characteristic qualities of the genuine Yankee before he was swamped by the immigration of millions of the huns or had set up to talk philosophy. It was the keen mother-wit of a race distinguished for strong common sense, and marked by a curious reserve produced by a Puritan education or by the natural temperament of the race. Nothing could be better or more racy in its way, though to many tastes it appeared to be rather too dry and to verge at times upon the cynical. This last quality, indeed, is much more conspicuous in some of Hoer's successors, who have chosen to flavour their natural wit with a considerable dose of irreverence. But, not to dwell upon the peculiar qualities of the genuine article, we may admit that even the *Liter or Argenus Ward* variety of humourist had some real merits which more or less justified the popularity of their books in England. Unluckily the success has led to a host of imitators, and, as in other cases, the difference between the Brummagem article and that upon which it is modelled is that, whereas the true Yankee humour is the expression of a particular type of intellect, the sham humour represents only the incessant application of a simple trick. Here, again, we might construct a formula which would enable any man of ordinary capacity to manufacture just as much facetiousness of this variety as he pleased. One secret, if it can be called a secret, is simply to speak of things in totally disproportionate language; as, for example, you may either describe a great national solemnity as if it were a meeting of drunken costermongers or adopt the inverse method. But this trick is common to other varieties of humorous writing. To give the special Yankee twang to the mixture, it is desirable to introduce a flavour of blasphemy or cynicism. There are dangers in adopting the first expedient, but the last presents no difficulty whatever. Thus, for example, it has come to be recognized as a very funny mode of speech to describe a hideous crime or a startling accident in entirely inappropriate language. If a dozen passengers have been killed on a railway by the gross neglect of the officials, you have only to say that the clerks playfully sent a wrong message, with the object of gratifying their scientific curiosity as to the collision of heavy bodies; and that, owing to a trifling excess of zeal, a few passengers who had not explicitly consented to the experiment were more or less spoilt in carrying it out. Or, if a brutal labourer kicks his wife to death it is just as easy as not to say that he took a rather stringent view of the matrimonial relation, and chose to emphasize a delicate remonstrance by administering a few rhetorical flourishes with the toe of an iron-shod boot. This artifice is for a time impressive by its novelty, and does indifferently well for what is called scathing sarcasm. We are struck by the ingenuity of the irony, and think that the writer must be a very clever fellow always to say white when he means us to understand black. But when the dodge has been repeated a few dozen times, it becomes, to our taste at least, inexpressibly wearisome. If you want to call a man a knave, it is simpler in the long run to call him knave than to describe him as a gentleman with eccentric views of moral obligations. It is just as easy to use one phrase as the other; and when the plan of inverting language has once become familiar, it is probably best to use the directest mode of expression.

Why should not such methods of mechanical joking be put down? The only objection is probably one which recalls Mr. Mill's early cause of melancholy. He was afraid that all the tunes in the world would be used up; and in the same way, funny writers are probably afraid that every known variety of joke will be worn out. They therefore continue to use over and over again the same good old device of grim humour which Swift originated in the proposal for eating Irish babies. Without giving our reasons for thinking the fear chimerical, we may simply observe that the cure is worse than the evil. If all tunes were being exhausted, we should still decline to be grateful to persons who should insist upon always regaling our ears with a single effete melody. And on the same principle, we would rather have no facetious writing at all than a facetiousness which is becoming more tiresome than the most deadly solemnity.

SWITZERLAND IN ITALY.

THE mysteries of tourist geography are endless. We trust that our readers have not forgotten the difficulty which Messrs. Cook and Co. felt, after crossing St. Gotthard, in "believing that they were still in the land which produced a Tell." On the other hand, Messrs. Bradshaw and Co., an equally high authority, define a certain, or uncertain, part of the earth's

surface as "Switzerland or the Alpine country." We may suppose therefore that they would not share Messrs. Cook's difficulty in believing that a Tell had been produced anywhere where there are Alps. We remember, years and years ago, seeing a playbill which announced the performance of "Hofer, or the Tell of the Tyrol." Would Messrs. Cook feel the same difficulty anywhere about Innsbruck which they felt somewhere about Bellinzona? Or would Messrs. Bradshaw rule that, as Tyrol is an Alpine country, it is therefore Switzerland, and a land in which we have a right to look for the production of Tells. To be sure Tell, in the legend, shot somebody else, while Hofer, in the history, got shot himself; but this is a slight matter so long as both had something to do with mountains and something to do with shooting. Tell has been long ago ruled to be the Sun-god, and we have no doubt that, with a little exercise of ingenuity, a place in mythology might be found for Hofer also. Still, though we must be allowed our laugh at the way in which our guides put forth their thoughts, there is a meaning in the somewhat grotesque utterances of both of them. Whether we look at the map or at the land itself, there is a certain seeming strangeness in Ticino being a Swiss Canton, and this we conceive to be Messrs. Cook's meaning, when the flourish about producing a Tell has been "biled and peeled." On the other hand, if, with Messrs. Bradshaw, we take the less sentimental line of physical geography, if we assume that "the Alpine country" must have a distinct being of its own, we should certainly not fix its boundaries at the present boundaries of the Swiss Confederation. There are purposes—and we have no doubt that climbing purposes are among them—for which it would not be convenient to attend very carefully to the frontier on the map. It does seem odd that a man at Mendrisio should not be a countryman of his neighbour at Como, of his own speech and manners, and that he should be the countryman of the man of distant Basel with whom he seems to have nothing in common. And, on the other hand, when we have got the notion from a physical point of view, by no means an unnatural notion—of an "Alpine country" as something which has a distinct existence, there is something strange in finding that "the monarch of mountains" has no part or lot in the land which is held to be peopled with his subjects. After all, the state of mind which is puzzled at finding that certain parts of Switzerland are Switzerland, and that certain parts of other countries are not Switzerland, has its parallels in our own islands. It is a received article of the tourist's faith that a certain part of Lancashire is, for tourist purposes, to be looked on as Cumberland, and that a large part of Somerset is, with still less of excuse, to be looked on as Devonshire.

But, leaving tourists aside, the existence of an Italian, as well as of a German and a Burgundian, Switzerland will supply the thoughtful traveller with several subjects for musing, geographical, historical, and political. Why is it that it seems strange to find Switzerland south of the Alps any more than north? If the "Alpine country," the land of mountains and valleys and lakes, is held to have a separate being of its own, the "Alpine country" may just as reasonably take in the southern as the northern slopes and spurs of the great mountain range. If we look on the mountains themselves as a natural boundary, if we rule all to the south to be naturally Italy, we may rule all to the north to be naturally Germany. If the Rhine is supposed to be a natural boundary in the one case, the Po will do just as well in the other. The truth is that, as far as natural and historical boundaries go, there is just as much reason for carrying Germany up the northern slope of St. Gotthard as there is for carrying Italy up the southern slope. If Lugano and Bellinzona are naturally Italian, Zürich and Luzern are just as much naturally German. Yet not only people who fancy that Switzerland has been a separate country from all eternity, but those who know how the Old League of High Germany really began and spread, cannot withstand some degree of Mr. Cook's feeling of incongruity on finding that, in the valley of the Ticino, and even at the southern end of the Lake of Lugano, we are still on Confederate ground. The real cause of the feeling of incongruity lies in the peculiar history of the single Italian canton, as compared with that of the German and the Burgundian cantons. Of the original cantons we need not say that none was Italian; if we were to say that none was Burgundian, we should be sinning against strict geographical accuracy, for as late as the fifteenth century Bern was sung of

Als Kionn im Burgundenreich;

but all at least were thoroughly German in speech and history. But of the two classes of Romance-speaking lands which now form part of the Confederation, the League has spread itself in quite different ways into the land of Oc and into the land of St. In the Burgundian lands the Confederates were not mere conquerors; Vaud undoubtedly was strictly a conquered land, but Geneva, Neuchâtel, and the former bishopric of Basel, were all allies before they became Confederates. But south of the Alps the Confederates appeared as mere conquerors, as alien and aggressive rulers. In the land which forms the present Canton of Ticino there was in the old state of things not only no canton, but no ally. All was mere subject land conquered or ceded, districts subject to this or that canton or groups of cantons. As long as we climb the St. Gotthard pass on its northern side, the name of Uri keeps its natural meaning of eternal freedom; cross over into the Levantine valley, and the name of Uri means only the hardest bondage. The men who so stoutly refused to acknowledge any master over themselves were quite ready to become the despotic masters of others. Pass

a little lower, Bellinzona stands encompassed by her three castles, in which the *Fogts* of Uri, Schwyz, and Unterwalden lived to hold down the conquered Italians quite as straitly as ever the mythical Gessler could have held their own forefathers. In the later acquisitions to the south, the common property of the Confederates, the rule was the same; all was bondage, only it is said that the yoke of oligarchy pressed lighter on the subject than the yoke of democracy, and that the Italian bailiwicks felt it as a comparative respite when the turn to rule over them passed from Uri or Unterwalden to Bern or Zurich.

It is plain that the connexion of a land under these circumstances with the Confederation was of another kind from that of the Romance-speaking allies, or even the Romance-speaking subjects, north of the Alps. Vaud had its wrongs; but they were hardly so heavy as the wrongs of Bellinzona and the Levantine Valley. No change could have been greater than that which turned these lands, with their various and shifting lords, into the independent Canton of Ticino. The neighbouring land, which stood in the same relation to the Three Leagues of Rhetia as they did to the Confederacy, was doomed to another fate. In the case of the Valtellina, the connexion between master and subject was wholly broken. When Graubünden became a Swiss Canton, Chiavenna and Bormio were wholly cut asunder from it, and they have since followed the shifting destinies of Northern Italy. This, we may add, makes the position of Ticino, and its look on the map, yet more incongruous. If the Valtellina had become another Italian Canton, the isolation of Ticino would have been greatly lessened. It would no longer have so thoroughly the look of a piece of one land running irregularly into another. As it is, the boundary which divides Switzerland from Italy seems to be one of the most artificial and capricious in the whole map of Europe. There is no visible reason why this scrap of the side of a lake should be Swiss and that other scrap Italian. Only we must remember that there is just as little visible reason why Schaffhausen should be Swiss and Constanx German. The purely geographical difficulty is the same on both sides.

The fusion of Ticino with the rest of Switzerland would seem, at least on the Ticinese side, to have been complete. The difficulties of Messrs. Cook must have risen to their height as they stood by the shores of the Lake of Lugano, under an Italian sky and surrounded by purely Italian buildings, and saw that the spot on which they stood was called "Piazza Guglielmo Tell." Old differences must have been pretty well forgotten when a patriotic citizen of Lugano could, as a sign of his patriotism, set up a statue of the hero of his former oppressors. We do not remember that Vaud reverences the particular heroes of Bern; but then Vaud has some kind of claim to heroes of its own, while we are not aware that Ticino, as a land apart from both Italy and Switzerland, ever had any.

The history of these subjects seems at first sight to contradict certain lessons which we learn from the analogous pages in the history of old Greece. In Greece democracy seems better able to undertake the government of dependencies than oligarchy. In Switzerland, and we may say in Italy, it was the reverse. Athens was a less harsh mistress than Sparta, but Uri was clearly a harsher mistress than Bern. Is the cause of the difference that in Greece the highest civilization was to be found in a democratic city, while in Switzerland the rural democracies naturally lagged in all outward respects behind the civic oligarchies? Yet democratic Florence was at least as highly advanced in these matters as oligarchic Venice, and certainly none of the Italian dependencies of Venice were so bitter against their mistress as Pisa was against Florence. Is it that the utter failure of Sparta in the government of dependencies arose, not so much from the mere fact of the government being oligarchic, as from the special nature of that government and of the national character? From the little that we know of Corinth, her aristocracy seems, notwithstanding the malicious hatred of Korkyra, to have more successfully grappled with this problem. Setting forms of government apart, a man of Uri sent to govern a subject district must have been very like a Spartan harmost; the Athenian and the Bernese had each of them much better experience at home. And as for Florence, we must remember the intense spirit of local and civic rivalry among the Italian commonwealths—a spirit in which Venice, a fragment of the East resting at anchor alongside of Italy, had no share. In her Lombard neighbours she might have enemies, she might have subjects, but she had no rivals. Verona and Brescia were not to her as Pisa was to Florence. Add also that Athens, a commonwealth formed, not only of the city of Athens but of the whole land of Attica, was less distinctly local and civic than Florence, the very embodiment of those feelings. On the whole, we may say that, while the rule of one city or district over another is in itself unjust, the yoke may be much lighter or heavier in different cases, and that the lightness or heaviness of the yoke does not depend wholly on the form of government of the ruling State, but on several causes, of which that is only one.

One lesson more may be drawn from this seemingly incongruous land of Swiss Italy or Italian Switzerland. In the long run of history a momentary loss may be a final gain, and a momentary gain may be a final loss. The districts in the Netherlands which were added to France by Louis the Fourteenth doubtless gained at the time; for, bad as the rule of France was, that of Spain was incomparably worse. But, besides that France in annexing Artois annexed Robespierre, just as in annexing Corsica she annexed Buonaparte, had those provinces remained to Spain then, they would now serve a European purpose in strengthening inde-

pendent Belgium. So, on the other hand, the Italian lands which were subject to the Confederation were perhaps worse off even than lands under a Duke of Milan or a King of Spain; certainly they were far worse off than lands under an Austrian Emperor or a French King of Italy. But because these lands lived on in their bondage, a worse bondage than that of any of their neighbours, they have been in the end rewarded with the highest freedom.

So we muse beside the statue of Tell at Lugano, beneath the campanile of Santa Maria degli Angeli, beside the vast hotel into which his monastery has been so strangely changed. The hero never existed; if he did exist, Lugano had no share in him; yet it is a sign that no small change has been wrought, when his image is deemed to be as much at home by the shores of the Italian lake as it is on the shores of the German lake around which his legend first came into being.

ENGLISH CLERGYMEN IN FOREIGN WATERING-PLACES.

THOSE persons who object to the influence of the clergy in their parishes at home, and who dislike the idea of being laid hold of by the ecclesiastical crook and dragged up steep ways and narrow paths, ought to visit some of our little outlying settlements in foreign parts. They might take a revengeful pleasure in seeing how the tables there are turned against the tyrants here, and how weak in the presence of his transmarine flock is the expatriated shepherd whose rod at home is oftentimes a rod of iron, and his crook more compelling than persuasive. Of all men the most to be pitied is surely the clergyman of one of those small English settlements which are scattered about France and Italy, Germany and Switzerland; and of all men of education, and what is meant by the position of a gentleman, he is the most in thralldom. His very means of living depending on his congregation, he must first of all please that congregation and keep it in good humour. So, it may be said, must a clergyman in London whose income is from pew-rents, and whose congregation are not his parishioners. But London is large: the tempers and thoughts of men are as numerous as the houses: there is room for all, and lines of affinity for all. The Broad Churchman will attract his hearers, and the Ritualist his, from out of the mass, as magnets attract steel filings, and each church will be filled with hearers who come there by preference. But in a small and stationary society, in a congregation already made and not specially attracted, yet by which he has to live, the clergyman finds himself more the servant than the leader, less the pastor than the thrall. He must "suit," else he is nowhere, and his bread and butter are vanishing points in his horizon; that is, he must preach and think, not according to the truth that is in him, but according to the views of the most influential of his hearers, and in attacking their souls he must touch tenderly on their tempers.

These tempers are for the most part lions in the way difficult to propitiate. The elementary doctrines of Christianity must be preached of course, and sin must be held up as the thing to avoid, while virtue must be complimented as the thing to be followed, and a spiritual state of mind must be discreetly advocated. These are safe generalities, but the dangers of application are many. How to preach of duties to a body of men and women who have for the time thrown off every national and local obligation, who have left their estates to be managed by agents, their houses to be filled by strangers; who have given up their share of interest in the school and the village reading-room, the poor and the parish generally; men and women who have handed themselves over to indolence and pleasure-seeking, the luxurious enjoyment of a fine climate, the pleasant increase of income to be got by comparative cheapness of breadstuffs, and the abandonment of all those outgoings roughly comprised under the head of local duties and local obligations? They have no duties to be reminded of in those moral generalizations which touch all and offend none; and the clergyman who should go into details affecting his congregation personally, who should preach against sloth and slander, pleasure-seeking and selfishness, would soon preach to empty pews and be cut by all his friends as an impertinent going beyond his office.

His congregation too, composed of educated ladies and gentlemen, is sure to be critical, and therefore all but impossible to teach. If he inclines a hair's breadth to the right or the left beyond the point at which they themselves stand, he is held to be unsound. His sermons are gravely canvassed in the afternoon conclaves which meet at each other's houses to discuss the excitement of the Sunday morning in the new arrivals or the new toilets. Has he dwelt on the humanity underlying the Christian faith? He is drifting into Socinianism, and those whose inclinations go for abstract dogmas well backed by brimstone say that he does not preach the Gospel. Has he exalted the functions of the minister, and tried to invest his office with a spiritual dignity and power that would furnish a good leverage over his flock? He is accused of sacerdotalism, and the free-citizen blood of his listening Frasnians is up and flaming. Does he, to avoid these stumbling-blocks, wander into the deeper mysteries and discourse on things which no man can either explain or understand? He is accused of presumption and profanity, and advised to stick to the Lord's Prayer and the Sermon on the Mount. If he is earnest he is impertinent; if he is level he is cold. Each member of his congregation, subscribing a couple of guineas towards his support, feels as if he or she had claims to that amount over the body and soul and mind and powers of the poor parson in his

or her pay; and the claim is generally worked out in snippets not individually dangerous to life or fortune, but inexpressibly aggravating, and as depressing as annoying. For the most part, the unhappy man is safest when he sticks to broad dogma, and leaves personal morality alone. And he is almost sure to be warmly applauded when he has a shy at science, and asserts that physicists are fools who assert more than they can prove, because they cannot show why an acorn should produce an oak, or how the phenomena of thought are elaborated. This throwing of date-stones is sure to strike no listening djinn. The mass of the congregations sitting in the English Protestant churches built on foreign soil know little and care less about the physical sciences, but it gives them a certain comfortable glow to think that they are so much better than those sinful and presumptuous men who work at guses and the spectroscope, and they hug themselves as they say, each man to his own soul, how much nicer it is to be dogmatically safe than intellectually learned.

Preaching personal morality indeed, with possible private application, would be rather difficult in dealing with a congregation not unfrequently made up of doubtful elements. Take that pretty young woman and her handsome *roué*-looking husband who have come no one knows whence, and are no one knows who, but who attend the services with praiseworthy punctuality, have any amount of money, and are being gradually incorporated into the society of the place. The parson may have had private hints conveyed to him from his friends at home that, of the matrimonial conditions between the two, everything is real save the assumed "fines." But how is he to say so? They have made themselves valuable members of his congregation, and give larger donations than any one else; they have got the good will of the leading persons in the sacred community, and, having something to hide, are naturally careful to please, and consequently popular; he can scarcely give form and substance to the hints he has had conveyed to him; yet his conscience cries out on the one side, if his weakness binds him to silence on the other. In any case, how can he make himself the Nathan to this questionable David, and, holding forth on the need of virtuous living, thunder out, "Thou art the man!"? Let him try the experiment, and he will find a hornet's nest nothing to it. How, too, can he preach on honesty to men, perhaps his own churchwardens, who have outrun the constable and outwitted their creditors at one and the same time? how lecture women who flirt over the borders on the week days, but pay handsomely for their sittings on Sundays, on the crown with which Solomon endowed the lucky husband of the virtuous woman? He may wish to do all this; but his wife and children, and the supreme need of food and firing, step in between him and the higher functions of his calling; and he owns himself forced to accept the world as he finds it, sins and shortcomings with the rest, and to take heed lest he be eaten up by over-zeal or carried into personal darkness by his desire for his people's light.

Sometimes the poor man is in thrall to some one in particular rather than to his flock as a body; and sometimes the dominant power is a woman; in which case the many contrarieties besetting his position may be multiplied *ad infinitum*. Nothing can exceed the miserable subjection of the clergyman to a feminine despot. She knows everything, and she governs as much as she knows. She makes herself the arbiter of his whole life, from his conscience to his children's boots, and he can call neither his soul nor his home his own. She prescribes his doctrine, and takes care to let him know when he has transgressed the rules she has laid down for his guidance. She treats the hymns as part of her personal prerogative, and is violently offended if those having a Ritualistic tendency are sung, or if those are taken whereof the tunes are too jaunty or the measure too slow. The unfortunate man feels under her eye during the whole of the service like a schoolboy under the eye of his preceptress; and he dare not even begin the opening sentences until she has rustled up the aisle and has said her private prayer quite comfortably. She holds over his head the terror of vague threats and shadowy misfortunes should he cross her will; but at the same time he does not find that running easy in her harness brings extra grist to his mill, or that his way is the smoother because he treads in the footsteps she has marked out for him. Sometimes she takes a craze against a voluntary, sometimes she objects to any approach to chanting, and if certain recalcitrants of the congregation, in possession of the harmonium, insist on their own methods against hers, she writes home to the Society and complains of the thin edge of the wedge and the Romanizing tendencies of her spiritual adviser. In any case she is a fearful infliction; and a church ruled by a female despot is about the most pitiable instance we know of insolent tyranny and broken-backed dependence.

But the clergymen serving these transmarine stations are themselves not often men of mark nor equal to their contemporaries at home. They are often sickly, which means a low amount of vital energy; oftener impecunious, which precludes real independence. They are men whose career has been somehow arrested, and their natures have suffered in the blight that has befallen their hopes. Their whole life is more or less a compromise, now with conscience, now with character, and they have to wink at evils which they ought to denounce, and bear with annoyances which they ought to resent. In most cases they are obliged to eke out their scanty incomes by taking pupils; and here again the millstone round their necks is heavy, and they pay a large moral percentage on their pecuniary gains. If their

pupils are of the age when boys begin to call themselves men, they have to keep a sharp look-out on them; and they suffer many things on the score of responsibility when that look-out is evaded, as it necessarily must be at times. As the characteristic quality of small societies is gossip, and as gossip always includes exaggeration, the peccadilloes of the young fellows are magnified into serious sins, and then bound as a burden on the back of the poor cleric in thrall to the idle imaginings of men and the foolish fears of women. One black sheep in the pupillary flock will do more damage to the reputation of the unhappy pastor who has them in hand than a dozen shining lights will do him good. Morality is assumed to be the free gift of the tutor to the pupil, and if the boy is had the man is to blame for not having made that free gift betimes.

Look at it how we will, the clergyman in charge of these foreign congregations has no very pleasant time of it. In a sense expatriated, his home ties growing daily weaker, his hope of home preferment reduced to *nil*, his liberty of conscience a dream of the past, and all the mystical power of his office going down in the conflict caused by the need of pew-rents, submission to tyrants, and dependence on the Home Society, he lives from year to year bemoaning the evil chances which have flung him on this barren, shifting, and desolate strand, and becoming less and less fitted for England and English parochial work—that castle in the air, quiet and secure, which he is destined never to inhabit. He is touched too in part by the atmosphere of his surroundings; and to a congregation without duties a clergyman with views more accommodating than severe comes only too naturally as the appropriate pastor. The whole thing proves that thralldom to the means of living, or rather to the persons representing those means, damages all men alike—those in cassock and gown as well as those in slop and blouse—and that lay influence can, in certain circumstances, be just as tyrannical over the clerical conscience as clerical influence is apt to be tyrannical over lay living.

THE "SYNOPTICAL TABLES" OF THE UNIVERSITIES COMMISSION.

THE Universities Commissioners, at great inconvenience to themselves as well as to everybody else concerned, have accumulated a mass of information which they have hitherto been unable properly to digest. They handsomely acknowledge that they have given much trouble to Bursars and other officers by seeking information "in order to elucidate the inquiries according to the method which has been pursued." There used to be a story of a mathematician who dreamed that he was under the sign of the square root and could not extract himself. Henceforth the usual form of academical nightmare will probably be to fancy oneself Bursar of one's college engaged in "the compilation of elaborate returns and information in very minute detail" required by the University Commission "in order adequately to discharge the duty entrusted to it." It must be owned that the Commissioners have spared neither themselves nor others. They have painfully collected details, and they have rashly attempted generalization. They obtained Returns and framed Abstracts of them, and if they had stopped here nothing could be urged against them except that they had perhaps given unnecessary trouble. But unfortunately they proceeded to frame "Synoptical Tables" from the Abstracts, and these Tables have been impugned by letters in the *Times*, whereupon the Secretary to the Commission avows that they are not and cannot be what they profess to be. "The Synoptical Tables were never intended," writes Mr. Roundell, "to be read without the explanations and qualifications contained in the Abstracts of Returns." It is a pity that the Report did not declare the intention of its authors. We should have supposed that a synopsis was meant to be accepted as correct so far as it went, but if we must end by reading the Abstracts, we might as well have begun with them.

We observe that the accounts of St. John's College, Cambridge, are made up on a different principle from that of all the other Colleges, and as the Master of St. John's was a member of the Commission, and probably understood the subject in hand as well as any member of it, this divergence on a cardinal point is remarkable. It arises in regard to Trust Estates, to which the Commissioners tell us that their attention has been especially called, as indeed it could not fail to be. A moderate acquaintance with the finance of any College would suffice to show that these Trust Estates were likely to be a *crux* to the compiler of Synoptical Tables. The Commissioners have sufficiently indicated in the Report the difficulty that might be expected to arise. "There are only a very few cases in which the beneficial interest of the trust property is wholly external to the University or College which holds the trust. In almost all cases the trustee-corporation has a beneficial interest, either contingent or partial, in the trust estate." We need quote no further to show that a correct view of the property held by the Colleges for purposes of education and learning could not be obtained without reference to these Trust Estates. It is well observed in the Report that "trust funds, although not divisible among the Head and Fellows of a College, yet in many cases indirectly increase the divisible revenue, inasmuch as they bear charges for chapel, library, repairs and the like which would otherwise fall on the general funds of the College." Among the objects of these trusts are the maintenance of or aid towards a professorship, teachership, or lectureship; scholarships or exhibitions, with preference for candidates from some particular school or district,

and power to the College to elect by open competition in default of properly-qualified candidates; prizes; the purchase of benefices, and the improvement of benefices in the gift of the College. As an example of a trust fund of which the beneficial interest is wholly external to the College that holds it we may take that of Pate's Charity, held by Corpus Christi College, Oxford, of which the income is about 1,600*l.* a year. The College receives one-fourth of the income of this fund for its corporate use, and pays three-fourths to certain charitable uses at Cheltenham of which the maintenance of the Grammar School of that town is the chief. In this case therefore it is clear that one-fourth, or about 400*l.* a year, ought to be added to the "corporate income" of the College, while, as regards the other three-fourths, the College has not even a contingent or partial interest. As an example of the opposite kind to this, we will take the Trust Funds of St. John's College, Oxford, of which the income is about 1,350*l.* a year, out of which about 1,000*l.* a year is paid to the Fereday Fellows and Casberd Scholars, who become on election, if they were not before, members of the College. It would seem therefore that the College has what may fairly be called a beneficial interest in the larger part of these Trust Funds, and that, in order to get at the income of St. John's College, according to popular understanding of the term, we ought to add about 1,000*l.* a year to the income given in the Report. The plan of the Commissioners is, however, to keep the income of these Trust Estates separate from what they call Corporate Income at the outset of their Report, although they lump the whole in one grand total at the end. But it is plain that in no reasonable sense of words can the three-fourths of Pate's Charity which is spent in Cheltenham be regarded as University or College property, whereas the Trust Fund by which the Fereday Fellows of St. John's College are paid might fairly be so regarded. We dwell on these details in order to show the danger of generalizing on this subject, or, in other words, of attempting to frame Synoptical Tables which shall convey at a glance a correct idea of the result of a complicated and difficult inquiry.

This principle of separating the Trust Funds from the Corporate Income was, however, adopted by the Commissioners in all cases except that of St. John's College, Cambridge, of which the Master was a member of the Commission. The total income of that College was returned to the Commission at nearly 50,000*l.* a year, of which upwards of 4,000*l.* a year arises from Trust Funds. The Abstract of the Return for that College has appended to it a letter from the Master to the Secretary of the Commission, giving the total income from corporate and trust property, deducting the total expenditure, and showing the balance. This is as much as to say that the Commissioners may arrange the figures of other Colleges as fancy dictates, but the Master of St. John's College will take care that its accounts shall be rendered in what he conceives to be a business-like manner. We have no information as to the precise purposes to which the Trust Funds of this College are applicable. But probably the assumption that they are for the benefit of the College would be nearer the truth than the opposite assumption that they are for external purposes. The same assumption, however, might be made as to a large part of the Trust Funds of other Colleges which are not added to the Corporate Income as has been done at St. John's College. It follows that when the Synoptical Table shows the Corporate Income of St. John's College on the same principle as has been adopted for other Colleges at 46,000*l.* a year, it makes that income in the judgment of the Master too little by 4,000*l.* a year. This, however, is a trivial matter compared with that which is made the subject of complaint by the Treasurer of Christ Church, Oxford. The internal income of that College from "room-rents, fees, profits of establishment, and other like sources," appears in the Abstract of Returns at upwards of 10,000*l.* a year, but the same Abstract shows that upwards of 6,000*l.* a year is disbursed for "college servants" and "maintenance of establishment." The Treasurer complains that this sum of 10,000*l.* a year is made to appear in the Synoptical Table as clear income, whereas at least 6,000*l.* ought to be deducted from it. When this complaint is brought by the *Times* to the notice of the Secretary, he answers with perfect gravity that "uniformity of principle in framing the Tables was precluded by the necessities of the case." We should have thought, if that were so, that the framing of Tables was precluded also, and that the world might have gone on without them. The Treasurer illustrates the treatment which Christ Church has undergone by reference to the case of an hotel whose gross receipts are considered as net profits. It happens, too, that for other Colleges net profits have been taken as income, and thus Christ Church appears richer in comparison with those Colleges than it really is.

It is, we think, matter for regret that the Commissioners gave themselves the trouble to compile these Tables. Mr. Carlyle speaks somewhere of persons who have never seen the book of nature, but only some school synopsis thereof, "from which, if taken for the real book, more error than insight is to be derived." The Secretary to this Commission, however, seems to have contemplated that everybody would read all that the Commission published, and we are bound to say that those who desire to understand the subject had better do so. The Commissioners have caused trouble to the Bursars, and incurred risk of error, by requiring, whether rightly or wrongly we do not say, accounts to be furnished in forms different from those customary in the Colleges. Thus it appears from the Abstract of Returns for Trinity College, Cambridge, that in the year 1871 "Fellows (524)" divided among them 18,371*l.* It might be inferred from a mere perusal of the abstract that there are only 52 or 53 Fellows of Trinity, whereas there are really 60 Fellows;

and it is probable that if the accounts of that College had been produced as the Bursar keeps them this fact would clearly appear. The internal income of Trinity College appears by the abstract to be nearly 10,000*l.* a year, but we observe that the two items of disbursement "College Servants" and "Maintenance" amount to nearly 8,000*l.* a year, and it is highly probable that the accounts, properly stated, would show no "internal income" at all, or perhaps a loss. If indeed there were any distinct advantage in framing the accounts as required by the Commissioners, we feel sure that the Bursars would not mind the trouble. But if the only result of much labour and vexation is to enable the Secretary to frame Synoptical Tables which, he assures us, were never meant to be relied upon, we think that perhaps the Bursars may be excused for feeling a little irritation. The Commissioners "regret to say that Sidney Sussex College failed to give the required information," and we observe that Corpus Christi and Queen's Colleges, Cambridge, have answered the inquiries of the Commissioners imperfectly in several respects. Both these Colleges appear to consider the distribution of the tuition fees as a private matter of the tutors, but we think that on further reflection they will hardly maintain that view. It is quite possible indeed that the trouble which the Commissioners have been "obliged to give" may have been more strongly felt because its utility was not clearly perceived. But if the Returns are required in future years, as they probably will be, it would be desirable that some uniform system of making them should be adopted.

A PROTESTANT VIEW OF THE FALK LAWS.

THE letters on the Falk Laws which originally appeared in the *Morning Post*, and have since been copied into other English journals, contain very remarkable testimony from what appears to be an unsuspicious source as to the real nature and effects of the recent ecclesiastical legislation in Germany. The writer, whose name is of course for obvious reasons withheld, is stated by the editor of the *Post* to be "a German Evangelical divine of the highest distinction," and he looks at the new laws primarily, though not exclusively, in their bearing on his own communion. But he is well aware that whatever objections may be raised from the Evangelical side have an *à fortiori* application to the Roman Catholic aspect of the question; and although he pointedly disclaims all sympathy with "the theory of an infallible visible Church," he is anxious that Roman Catholics and Protestants alike should have fair play, and considers the religious interests common to both seriously compromised by the religious policy of the Prince Chancellor. He begins by explaining the difficulty experienced by "an Evangelical Christian" in forming a judgment on these laws, as well from his profound disapproval of the Vatican decrees which formed the pretext for their enactment, as from the strenuous endeavours of "the numerous journals subsidized for the occasion to represent the recent legislation as necessary, useful, and in no way injurious to religious life." He himself holds Papal infallibility to be only a logical conclusion from previous "Roman errors," and disputes the right of the Old Catholics to protest against it, and of the State to regard it as involving any fundamental change in the mutual relations of the civil and ecclesiastical authorities. These, however, are matters of abstract opinion. The real interest of the paper lies in its handling of the facts of the case. The writer roundly asserts that the origin of the new legislation is to be mainly attributed to "the personal decision" of Prince Bismarck. It was when the Ultramontane party in the Reichstag opposed his policy of centralization, and "he appeared to have made certain discoveries, of which there has been no further elucidation," implicating their loyalty and patriotism, that the Vatican decrees were first discovered to be dangerous to the State, the Old Catholics were ostentatiously patronized, and thus "cornucopia of exceptional laws and regulations overflowed against the Church"—and, "for the sake of equality," against the Evangelical Church also—"which practically issues in the establishment of the absolute omnipotence of the State in the religious domain." On this it is obvious to remark that, whether or not any more satisfactory account of the origin of the Falk Laws is producible than the *sic volo, sic jubeo* of the Imperial Chancellor, none has in fact been produced. The mysterious revelations which he darkly hinted at in the Reichstag, of Roman Catholic treachery and Jesuit machinations against the Empire, remain locked up, like the plenitude of Papal privileges before the Vatican Council, in *scrinio pectoris sui*. They must be accepted, if at all, on faith, and the public must be content, without knowing the dream, to witness the interpretation thereof in the system of minute persecution which our author next proceeds to exhibit and criticize in detail. The salient points of his indictment we purpose to reproduce for the benefit of our readers.

He begins with the new regulation on abuse of the pulpit, introduced into the Penal Code of the German Empire in 1871, which certainly does appear to constitute a portentous interference with ordinary liberty of speech. For it empowers the civil tribunals to punish with imprisonment, for a term not exceeding two years, any reference to civil affairs made by a clergyman in his official capacity, whether in church or elsewhere, which they may choose to regard as "calculated to disturb the public peace." Our critic observes that there are various local ordinances and by-laws, desecrating the Sabbath, banishing religion from schools, secularizing marriage and the like, which are most obnoxious to his coreligionists, but

against which no Evangelical minister, under this statute, could dare to open his lips. He probably speaks from experience, for it is notorious that several Evangelical pastors have been sent to prison under the provisions of the new code. The next point noticed is the transference, by a law of 1872, of the entire control and inspection of all schools throughout Prussia from the ecclesiastical to the civil authorities, and this in spite of the 24th Article of the Prussian Constitution still unrepealed, which provides that "the religious communities interested shall direct the religious instruction." It appears that the law has been carried out in such a manner as to supersede all clerical influence in schools; and the writer points out that, if its object was to guard against anti-national teaching by Roman Catholic inspectors, it is at once extravagant and inoperative. For the immediate purpose would have been equally attained by removing any particular inspectors open to such a charge; while priests who are so minded can still take advantage of their instructions for Confirmation and in the confessional to instil sentiments of hostility to the State—and are, he might have added, far more likely to do so than they were before. It will now, we are reminded, depend wholly on the caprice of a future Minister whether Christianity shall be altogether banished from the schools, and a Secularist system of education, after the Dutch model, established in its place. The elaborate comment which follows on the expulsion of the Jesuits has an especial value in one sense, because here the writer is something more than an impartial witness. He looks on the Jesuits as the avowed enemies of the Evangelical Church, and speaks in strong terms of their "law and objectionable morality." Nevertheless he unhesitatingly condemns the law against them on four different counts. It is dangerously vague, from its sweeping inclusion of "kindred orders and congregations" which it does not define; it is inequitable, for the Society is so completely part and parcel of the Roman Church that, where the former has a recognized legal existence, the latter cannot consistently be excluded; it is an arbitrary violation of personal freedom to dictate or interdict the residence in a particular place of persons who have not been convicted of any crime, simply as being members of a certain corporation; and lastly the law is impolitic, for the bodily expulsion of the Jesuits only tends to increase their moral and spiritual influence, as is shown in the case of Bavaria, Saxony, Württemberg and Baden, from whence the Order has long since been banished. "A contest with material weapons against spiritual convictions is always immoral and defeats its own ends"—a remark, by the way, which does not apply to one item only of the Prussian ecclesiastical legislation.

The writer goes on to examine the four laws of May 1873, with special reference to their bearing on the Evangelical Church. And before doing so he cites the 15th and 18th fundamental Articles of the Prussian Constitution, which had to be altered—we have seen already that the 24th was quietly ignored—before these new laws could be enacted. They now run as follows, the words in italics, which it will be seen amount virtually to a repeal of the original Article, having been interpolated in 1873:—

Art. 15. The Evangelical and Roman Catholic Churches, as well as every other religious community, order and administer their own affairs independently, but remain subject to the statutes and legal inspection of the State. *In the same measure, every religious community remains in possession and enjoyment of the establishments, foundations, and endowments appertaining to its various objects, religious, educational, and charitable.*

Art. 18. The rights of nomination, proposal, election, and confirmation in the filling up of ecclesiastical offices are abolished, so far as depends upon the State, and so far as the rights of patrons and other legal privileges are not involved. This provision does not apply to the appointments of clergymen in the army and other legal institutions. *Moreover the law regulates the privileges of the State in reference to the training, the appointment, and dismissal of clergymen and ministers of religion, and fixes the limits of ecclesiastical disciplinary power.*

This last addition has certainly all the force of a lady's postscript.

We now come to the May laws, which our author calls "the abrogation of the Habeas Corpus Acts of the Church," since they deprive the Roman and Protestant Churches alike of their independence. First there is the law of May 11, which places all educational institutions for clerical training under the absolute control of the State, forbids the opening of new boys' seminaries or the admission of new pupils into those already existing, requires all intending candidates for holy orders to pass a final examination in a German gymnasium, then to spend three years in a German State University or a Seminary approved by the Minister of Worship, and lastly to pass a public State examination in scientific subjects. It further subjects all appointments to any ecclesiastical office to the approval of the Oberpräsident of the district, whose duty it will be to reject nominees who have not fulfilled the legal conditions, or have been convicted or are accused of any offence punishable with hard labour or loss of civil rights, or of whom he may have reason to suppose that they will act in contravention of any actual or future laws of the State or decrees lawfully promulgated by the Government. Severe penalties of fine and imprisonment are affixed to the breach of any of these regulations, in accordance with which, as we need hardly remark, several Prussian Bishops have already been imprisoned and two are now threatened with deposition. There is a right of appeal to the new Supreme Court for ecclesiastical matters, which is a purely secular one. The writer complains bitterly of the tyrannical interference of this law in several particulars with the liberties and discipline of the Evangelical Church.

It prevents her ministers from studying, as has been very common hitherto, at Swiss, or French, or English Universities; it subjects their whole theological training to "the dominant latitudinarianism in Prussian governing circles," and exacts of them at the end of the course a scientific test not required of doctors or jurists, which would bar the ordination of a candidate whose opinions conflicted with those of the examiner; for it has been openly avowed that the aim of this examination is to replace "denominational definiteness" by "a broad and national education," or in other words to make the clergy rationalistic. Moreover the State reserves to itself by this law the right of excluding from orders or from clerical office any one who has, whether privately or publicly and in whatever fashion, made himself obnoxious to the existing Government; and thereby "the mainspring of the Church's authority, the filling of its offices with suitable persons, is taken away or seriously impeded." This has already been exemplified in the case of the Roman Catholic Bishops, and the Evangelical Church will be no less injuriously affected.

The law of May 12, on Church discipline, precludes all foreign ecclesiastics from exercising jurisdiction in Germany, and makes all but the most unimportant acts of ecclesiastical jurisdiction dependent on the sanction of the civil power; it also constitutes a Supreme Court of Appeal, consisting of eleven lay members, six of whom must be judges, which decides finally on all Church questions and has the right of deposing Church officers, bishops included. The writer points out at length how completely this law transfers all disciplinary authority—even in such purely spiritual matters as regulation of services, doctrinal teaching, and administration of sacraments—to State officials, who moreover are sure to be influenced by political considerations. And it must be remembered that no Catholics or Evangelicals who really adhere to their professed creed will consent to act on the new Supreme Court, which is charged with final and irresponsible powers, while the Minister of Public Worship is invested with a lay papacy "which is calculated to stamp his personal impression upon the Church to a most perilous extent." The law of May 13 forbids, under severe penalties, the infliction of ecclesiastical censures affecting "the person, property, liberty, or civic repute" of those concerned, or having reference to the doing or contemplating of any act authorized by law, and also forbids any public notice being given of Church censures. On this it is observed that the condition of "civic repute" virtually extends the prohibition to all Church censures whatsoever, and that acts allowed or required by the law may contravene the conscientious convictions of some religionists, as Quakers *e.g.* object to oaths. In summing up the writer remarks that the consequences of these laws for the Roman Church have already been demonstrated. "The Catholic Church is disorganized, and that disorganization is the deepest injury of the German Empire. The clergy are made martyrs and the laity fanatics, and the hearts of Catholics are daily more and more estranged from the Imperial Government and the fatherland." The effect on the Protestant Church will be no less disastrous, and already "the minds of Christian and Conservative citizens are filled with distrust." A common Consistory for the Lutheran, Reformed, and United Churches in the province of Hesse has been imposed by the State, and forty-two pastors, who protested, were ruthlessly deposed. The real conflict of the State is not so much against the Roman Church as against "religion and Christianity," and as long as the Imperial Chancellor retains office, still more serious conflicts are sure to occur. The writer feels confident that the Church will eventually triumph, and the judgments of God will strike the work of the present rulers, but meanwhile a terrible "period of suffering and combat is at hand" for all true Christians. Atheism and Communism are at the doors, and "those who now arrogate to themselves the right of bending conscience to their will may live to learn that he who sows the wind shall reap the whirlwind."

We have not left ourselves much space to comment on this remarkable document, and indeed our chief object has been to present the substance of it to our readers. Nor is much comment needed, when the facts speak for themselves. If this is the verdict of a Protestant pastor, who feels the pressure of the new legislation much less keenly than his Roman Catholic fellow-countrymen, and who regards the Jesuits and the infallible Church with feelings which ought to satisfy Mr. Newdegate, we can hardly wonder that its immediate victims should compare their oppressor to Diocletian and Julian the Apostate. It seems that a Mr. Stokes has just been appealing to the Home Secretary to know whether Professor Tyndall has not incurred the penalty of two years' imprisonment for violating the laws against blasphemy by his recent address to the British Association at Belfast; and in doing so he takes occasion to quote a well-known saying of the first Napoleon's, that an atheist is not a man to be argued with, but to be shot. We cannot tell how far Prince Bismarck shares this enthusiastic faith in theism, which he may possibly regard as an objectionably "denominational" tenet, but there can be little doubt that, if he held Napoleon's opinion, he would have little hesitation about acting upon it. Happily there is only one country in Europe at the present day where such a policy as that we have been considering would be tolerated, and probably there is but one living statesman who could have ex-cogitated or would care to enforce it.

HIGH ART FINANCE.

IT must be acknowledged that, from an æsthetic point of view, the speculative finance of the period is not without its merits. The prospectuses which from time to time descend upon us in such abundant showers usually display a bold simplicity and easy finish which indicate the existence of a matured and practised school. The stereotyped criticism, however, which is annually passed on the pictures at the Royal Academy, that they show much skill, but little genius, is perhaps still more applicable to the efforts of financial art. They certainly exhibit plenty of smartness and mechanical dexterity; but the imagination of the artists is confined within conventional grooves, and the standard of invention is undeniably commonplace. Moreover, there is a certain monotony in the continual repetition of the same ideas. First there is a run of mines, and then a run of branch railways; and when one form of ingenuity is worked out, there seems to be nothing for it but to fall back upon the other. The most ordinary mind is equal to the conception of a mine, although a certain sort of cleverness is no doubt required in order to produce a belief in its actual existence. Finance, in fact, has abandoned its flights and has fallen into rather plodding ways. There is a story of a great speculator who floated a Company for working a salt-mine of inexhaustible extent, which turned out to be the sea. But this was in other days. We have none of those strokes of financial genius now, no flights of purely romantic fancy. Even the most notorious of the manufacturers of bubble Companies generally endeavour to work the names of real places and even the names of real people into their advertisements, and the illusions which they seek to create are all of a prosaic turn. A trial, indeed, has just taken place at Dublin which shows that poetry and romance have not yet entirely deserted the cold pavement of the Stock Exchange. It is perhaps unnecessary to enter into the ethics of financial speculation, and it is at least more pleasant to regard it from a purely æsthetic point of view. To some persons it may seem not a particularly noble or elevating pursuit to be engaged in artificial efforts to depreciate other people's property for the purpose of frightening them into selling it at a loss, and those who occupy themselves with such enterprises are usually perfectly aware of what they are about. It appears, however, that an attempt has lately been made by a romantic broker to present the hard facts of the Share-list in a more elegant and engaging form by wreathing them with flowers of literature. A bald, prosaic telegram is received to the following effect:—"Sell ten Berks, ten Novas, ten Culeys, ten Leads, ten Westerns, and ten Midlands at best, and fifty French"; and it is answered with tropes and metaphors and a gay playfulness of language which would be likely, if anything could, to reconcile even a bear to the triumphant tactics of his enemies the bulls. "On Saturday morning," the broker writes, "the first thing, the bird was a clear 40,000*l.*, even taking into account the heavy loss on those confounded Erics. Surely it was needless to let such a fine specimen of ornithology loose; they are so very rare and highly esteemed in the best museums. However, the English literature"—only fancy consoling a bear with English literature!—"is a noble arsenal, and it says, 'There are bigger fish in the sea than ever came out of it.' So we must arm ourselves with piscatorial consolations against our ornithological mishaps." It must be delightful to have to do with a stock-broker who gilds one's not very pretty projects of material profit with such philosophical and literary lustre. "Saturday morning," he goes on, "left me broken-hearted, as I saw it sailing away on a pink cloud with a diabolical leer." Still he is full of comfort for his client, and suggests that something better must turn up, if only by way of reaction. "The knowing ones are 'bulls,'" and a turn of bulling is apparently prescribed as a change from bearing. It is to be feared that much of this fine writing was thrown away upon the gentleman to whom it was addressed.

In this instance we have a broker endeavouring to beautify and idealize the dull and dingy operations in which he is engaged, but unfortunately the materials with which he has to deal are not of a kind to lend themselves to such treatment. A new Company, however, has just been started which is really in itself a very fine example of the higher order of imaginative finance, and which certainly requires no varnishing. This Company is called "The General Expenditure Assurance Company," and we are told by its promoters that it has been established "for the purpose of assuring the return of all money expended from day to day." It need hardly be said that this object, if it can be carried out, will supply what may be truly described as a long-felt want. Everybody must have been annoyed by that inconvenient peculiarity of expenditure which makes it difficult to pay for anything without parting with the money. Every little boy would like to eat his cake and have it too, and, as he grows up, he would also very much like to combine keeping his money with spending it freely. This new Company will enable him to gratify this desire. An old proverb tells us that a penny saved is a penny gained, but the rule is now to be reversed, and the way to gain money is to spend it. It is in fact a realization in the region of practical finance of the game *qui perd gagne*. It is now placed in our power to attain affluence, not by penurious economy, but by lavish expenditure, and there must be a great many people, we imagine, who find expenditure come much more naturally and easily to them than economy. The Directors of the Company admit that the object they have in view may "at first sight appear astonishing"; but they have satisfied themselves that it is quite practicable, and, "like every great

discovery or scheme, easy and simple in its operation." The way in which it is proposed to relieve society of one of its greatest difficulties is this:—The Company appoints certain tradesmen of every class throughout the kingdom who are to pay a small premium to the Company, and to distribute the Company's coupons free of charge to their customers for the full amount of all purchases made for ready money. As soon as a customer has accumulated 5*l.* in coupons, he will forward them to the Company and will receive in exchange an Assurance Bond for 5*l.*, which the Company undertakes to redeem within a fixed period. Every half-year there will be a ballot of all the bonds issued in the presence of a Notary Public. The bonds which are drawn for redemption will be advertised in the newspapers and paid without deduction. The rest will stand over till the next ballot, and so on. The first series will be limited to 150 ballots, at the last of which ballots every bond not previously redeemed will be paid. That is to say, those who invest their money in this manner are to get it back at the end of seventy-five years, if their bonds are not drawn for redemption at an earlier date. In this way Paterfamilias may console himself with the reflection that the more his household eats and drinks, the more rapidly his youngsters wear out their clothes and boots, the longer his own and his elder sons' tailor's bills, and the milliner's bills of his wife and daughters, the more colossal will be the magnificent fortune which will all the while be steadily accumulating for the benefit of the family.

The explanation of this startling experiment in finance is found upon examination to be, as its promoters admit, extremely simple. It is just this—that the premiums received by the Company from its trade members are to be invested in Government and other securities, and will thus form an accumulative fund, from which all bonds will be redeemed. It is perhaps hardly necessary to point out that this is only a form of discount for cash, in which the payment of discount is postponed for seventy-five years instead of being given at once. If the purchaser of goods at one of the Company's affiliated shops were to invest at once the discount on each transaction, he would of course accumulate for himself the fund which the Company propose to provide him with at a rather remote date. The intervention of the Company would, therefore, appear to be superfluous. One object of the Company would seem to be to attack our proverbial philosophy on several important points, and it is natural that the reversal of "a penny saved is a penny gained" should be followed by a similar adaptation of "a bird in the hand is worth two in the bush." Distrust of the bush is, however, we are afraid, deeply rooted in human nature. It is obvious that the money which is to be provided by the shopkeepers in order to form the Company's accumulative fund must, in the first instance, be extracted from the pockets of customers. In an ordinary way the customer would at once get discount for cash payments, but, instead of this prompt and simple operation, there is to be a circuitous process of allowing the money to lie in the hands of the Company, and to be employed entirely at its discretion, for the best part of a century, on the chance of its being got back again by the descendants of the customer. It is proposed that shopkeepers should pay the Company a premium in order to be entered on their list, and the advantage they are to get in return is that "they will transact their business for cash instead of giving credit." This is an advantage, indeed, which they can enjoy at present, if they choose, without the assistance of the Company. Altogether this new project is a very pretty example of idealized finance, although it is certainly not flattering to the intelligence of the persons to whom it is addressed.

LIABILITY OF RAILWAY COMPANIES FOR DELAY.

THE County Courts offer valuable facilities for enforcing punctuality on Railway Companies. Several decisions have been given in actions brought by passengers, and all, with one exception, have been adverse to the Companies. In the most recent case, the Great Western Railway Company, who were defendants, relied upon a notice prefixed to their time-tables that they would not be accountable for any loss, inconvenience, or injury arising from delay or detention, unless upon proof that it arose "in consequence of the wilful misconduct of the Company's servants." The plaintiff took a first-class ticket from Reading to Henley by the train timed to arrive at Reading at 10.25 and to leave Reading at 10.30, to arrive at Twyford at 10.40 and to leave Twyford at 10.45, and arrive at Henley at 11 A.M. The train arrived at Reading punctually at 10.25, but did not leave Reading till 10.39. On arriving at Twyford the plaintiff found that the train to Henley had just left, and there was no other train for an hour. He took a fly and got to Henley in half an hour. The delay at Reading was occasioned principally by the want of porters to put luggage into the train. The train was a very light one, the plaintiff being the only first-class passenger. The plaintiff, who is a solicitor and treasurer of the County Court of Henley and other places, sued the defendants for 6*s.* 6*d.*, the expense of a fly from Twyford to Henley. The plaintiff admitted that he was cognizant of the notice already quoted.

Upon these facts three questions arose—(1) What was the contract between the Company and the plaintiff? (2) Was that contract affected by the notice? (3) Was the notice itself affected by "wilful misconduct" of the Company's servants?

The answer to the first question is easy. The contract between

the Company and the plaintiff was to convey the plaintiff to Henley in a reasonable time; and the question of reasonable time is no longer left at large, but is fixed by the Company's time-table, subject to accidents which reasonable care could not provide against. This contract arises on the purchase of a ticket, unless it be qualified by the notice; and thus comes the second question, to which the obvious answer is that the notice is *ultra vires* so far as it professes to attach to the right of travelling on the Company's own line the condition that the Company will not be responsible for any shortcoming of their servants not amounting to wilful misconduct. Thus far we have adopted the substance, and almost the exact words, of the judgment given in the Reading County Court, and the answers to the first two questions are enough to decide the case. Upon the third question, whether there was "wilful misconduct" of the Company's servants, the Judge of the County Court thought, "with some doubt," that there was, and here we incline to differ from him; but if he were wrong his error would not affect the soundness of his judgment on the main question. It was stated by the plaintiff, and not denied by the defendants, that "the delay at Reading was occasioned principally by the want of porters to put luggage into the train." It appears to us an abuse of language to say that this delay "arose in consequence of the wilful misconduct of the Company's servants," which are the words of the notice. The porters at Reading are no more able than other people to do two things at one time. If there are not enough porters to do the work of the station, the fault must lie with the managers of the Company or with the Company itself, but in neither case should we think the expression "wilful misconduct" applicable. Upon this point we are not without authority, and it happens to be furnished by another case against the same Company. In this case the plaintiff's goods were placed in a truck to be attached to a train passing the High Wycombe station late at night. The train brought some cattle to the station, and the defendants' servants, in order to prevent the cattle from being kept in their trucks till the next day, drove them into a yard, from which they strayed upon the railway, and upset the train, thereby injuring the plaintiff's goods. The plaintiff had undertaken to relieve the defendants from liability for damage unless it arose from "wilful misconduct" of their servants. When this case came before the Court of Queen's Bench Mr. Justice Blackburn said that there was admittedly no malice in what the servants did, and he agreed that there might be many cases of wilful misconduct without malice, but he did not agree that culpable negligence was necessarily wilful misconduct. The cattle were driven into a yard which communicated with the line. This was not the usual course of proceeding, but the object of doing so on this occasion was to deliver the cattle to their consignees that night. There might have been some neglect by the Company's servants, but "I cannot say," said the learned Judge, "how they can possibly be said to have been guilty of wilful misconduct." There was nothing to show that what they wilfully did—that is, drive the cattle into the yard—was likely to cause injury to the plaintiff's goods, or that they had knowledge of any danger to which they were exposing either the cattle or the train by what they did. Mr. Justice Quain remarked on the difficulty of defining the negligence which amounts to wilful misconduct so as to justify a conviction for manslaughter. "Something of the same kind," he said, "is intended here; but without defining it exactly, it is sufficient that the facts here show no culpable negligence at all, and negligence must be culpable to constitute wilful misconduct."

An appeal is, we believe, intended from the judgment of the Reading County Court, and the Company may rely on the case we have quoted to establish that there was no "wilful misconduct of their servants" causing the plaintiff to be delayed in his arrival at Twyford. But they will thus only show that the notice was not displaced by circumstances, supposing that notice to be otherwise applicable to the plaintiff, and this will be their point of difficulty. These notices, to be valid, must be reasonable. The Company has no power to impose unreasonable conditions on passengers, and the Judge of the County Court has held this condition to be unreasonable, and he is supported by authority in so holding. In an action brought against the Great Eastern Railway Company for delay in starting a train, the defence was that the Company by notice affixed to their time-tables declared that "they would not hold themselves responsible for delay, or any consequences arising therefrom." The plaintiff, a miller living at Framlingham, held a season ticket, and was accustomed to travel to London by the defendants' railway to attend the Mark Lane Corn Market. He came one day to the station at the usual time; the carriages were ready, but the engine had not steam up and could not go. Mr. Baron Martin, who tried the case, made short work with the notice limiting liability. "It is," he said, "mere nonsense for the defendants to say, as in effect they say, 'We will be guilty of any negligence we think fit, and will not be responsible.' It will be observed that in that case the notice was general that the Company would not be responsible for delay; whereas in the present case the Company announce that they will not be responsible for delay, unless caused by the wilful misconduct of their servants. It may be argued, therefore, that the ruling of Mr. Baron Martin in the former case is not an authority for the decision in the latter. There can, however, we think, be little doubt that the notice given by the Great Western Company is invalid. They say that they will only be responsible for wilful misconduct, and, as there may be culpable negligence which is not wilful mis-

conduct, they say in effect that they will not be responsible for such culpable negligence, whereas it is clear that they must be liable.

But it is a different question whether, under the circumstances of this particular case, the defendants' claim to be discharged from their ordinary duty of keeping time would be reasonable, irrespectively of any notice which they may have given. It will of course be conceded that a literal and absolute performance of the undertaking contained in their time-tables could not be exacted from them. Their duty is, as stated by the Judge of the Reading County Court, "to use all reasonable means to convey passengers to their destinations in the reasonable times which they have expressly fixed." The question therefore is, whether they used "all reasonable means" in the present case. It may be allowed that the case is not so strong against the Company as that which came before Mr. Baron Martin. "Here," said he, "a train is advertised, the plaintiff gets to the station, and finds the train there and the engine without steam up—the horse in the stable unharnessed." It was stated in that case that an hour and a half was needed to get steam up. In the present case the want of porters at the Reading station caused a delay of only nine minutes, which caused the plaintiff to miss the train at Twyford. There have been judgments on the Bench who have leaned strongly against extending the liability of Railway Companies, and it is not impossible that such a judge might view this case differently from the Judge of the County Court. If the case came before a jury they might probably consider that unnecessary delay at Reading was combined with unnecessary punctuality at Twyford. If the train must wait at Reading because the porters were engaged, it might be thought that the train could wait at Twyford until the train from Reading had arrived. Assuming that the trains on the branch line to Henley are under the control of the defendants, they surely ought to have so managed as to protect the plaintiff from the consequence of delay caused, as was admitted, by the imperfection of their own arrangements at Reading. We think that the view which a jury would be likely to take of the case was fairly expressed by the Judge of the County Court when he said, "It is clear that the absence of porters at the Reading station, which reasonable care might have prevented, occasioned the detention of the plaintiff at Twyford, and as he was able to procure a conveyance by which he got to Henley half an hour sooner than the Railway Company were prepared to convey him by the next train, I think that he was justified in hiring it, and that he is entitled to recover its cost against the defendants."

In another recent case a decision involving the same principle was given in the Burnley County Court against the Lancashire and Yorkshire Railway Company. In that case the Judge held that, although the Company do not guarantee the arrival and departure of the trains at the times stated, and do not hold themselves accountable for any injury which may arise from delay, and "make such terms part of the contract with the passenger," yet they are bound to use all ordinary means within their power to perform their contract; and if they omit to use such means and show no sufficient reason for the omission, they fail to perform the duty which the law imposes upon them of using reasonable care and diligence in conveying the passenger to his destination according to their contract with him. The plaintiff in that case took a ticket at Burnley for Barnsley. The train by which he started ought to have reached Wakefield in time for a train starting from that place for Barnsley. But the train from Burnley to Wakefield was accidentally delayed, and the train started from Wakefield for Barnsley before the plaintiff arrived at Wakefield. It appeared, however, that the plaintiff and other passengers from Burnley arrived at Wakefield soon after the departure of the train for Barnsley, and if the station-master at Wakefield had known that they were coming he would have detained that train for them. An accident had occurred soon after leaving Burnley which rendered it impossible for the passengers from Burnley to reach Wakefield at the usual time. Afterwards an arrangement was made for forwarding these passengers to Wakefield, and if, when this arrangement was made, the station-master at Wakefield had been informed of it, he would have detained the train starting for Barnsley until the Burnley passengers arrived at Wakefield. The Judge of the County Court held that the Railway Company were guilty of negligence in not sending this information by telegraph to Wakefield. As the train for Barnsley had left Wakefield before the plaintiff arrived there, he had to wait several hours for the next train, and thus he arrived at Barnsley too late to do his business, and had to go there on another day, and incurred expense which he now recovered against the Railway Company.

In one of the few reported cases of this kind that have been brought before Judges of the Superior Courts, the plaintiff proved only that it was Whitsun Monday, and the train by which he travelled, being heavy, was late, and he missed an appointment. The late Mr. Justice Crompton held that, without some evidence of negligence, the plaintiff could not recover against the Company. Among the recent cases in which Judges of County Courts have decided against Railway Companies, the best known is that of Mr. Forsyth, M.P. This was a stronger case of delay than that which has given occasion to these remarks, as indeed the Judge of the Reading County Court who decided both cases admitted.

It may not be amiss to observe the light which this discussion throws upon the utility or necessity of that accumulation of reports of cases which is often treated as a reproach to the English law. We have been trying to ascertain what view

Judges are likely to take of complaints against Railway Companies of delay in carrying passengers. There has been a growing disposition to entertain such complaints, and in order to measure this growth we collect as many cases of this class as we can readily find, and compare their features. In order to do this we have recourse to the various legal periodicals which report select cases from the County Courts and rulings of Judges of the Superior Courts sitting at *visi prius*. All this, be it observed, lies beyond the regular reports of cases in the Superior Courts, of which the bulk is sufficiently alarming. The truth is that the liability of Railway Companies in these cases is being established and defined, and while this process is going on it is necessary to note every word that falls from the Judges who are concerned in what is virtually law-making. It seems, therefore, that not only law reports but also legal periodicals are inevitable, although cumbersome, parts of our legal system.

POACHERS.

WITH those vacation speeches which set in so severely at this time of year there is sure to come a series of reports from the rural districts which are infinitely more sensational. The poachers begin to be out and busy as well as voluble members of Parliament and aspiring politicians on their promotion. The season tempts them, and the state of the covers. There are plenty of tame pheasants about, and the hares have not been much shot down. A good deal of rainy weather, and occasional sharp frosts towards the morning, are beginning to bring down the leaves, so that very soon "of a shiny night," as the old poaching ballad has it, it will not be difficult to distinguish the birds roosting in the branches against the moonlight. And although the regular poaching season has barely commenced, we hear already of a serious encounter in the Herefordshire woods. A party of adventurers came in collision with a force of keepers. Brought to bay, the poachers levelled their guns without intimidating their assailants. There was a desperate hand-to-hand scuffle and several shots were exchanged. Two of the keepers were wounded, more or less seriously. One of the poachers received part of a charge in the head, but, as his friends had the best of the skirmish and carried off their wounded, it is unknown whether the injury was likely to prove fatal.

It is by no means a pleasant thought that encounters of this kind are becoming yearly more common, and are likely to be more frequent still for all we can see to the contrary; in short, that murder must now be regarded as an everyday contingency in a trade to which a good many Englishmen regularly devote a large part of their time. But there can be no question that poaching pays much better than ever it used to pay. The game is more plentiful, there is a constant demand for it, and there are greater facilities of disposing of it to advantage. Now that proprietors breed so much for their annual battues, to take the free run of a well-stocked wood for an hour or so is like the opportunity of filling a bag in a poultry-house. The days which the lord of the manor has fixed for those great events of the year to which his friends and neighbours are bidden are matter of notoriety and nightly talk in all the low public-houses in his vicinity. Till then his young hand-fed birds have not been disturbed; and, entirely unsophisticated as they are, for the poacher it is pretty much a question of fetching them away without interference on the part of their guardians. There are difficulties of course. As the temptations to an on-slaught have increased, the defence has been strengthened in proportion. A great breeder of birds and hares seldom shows himself penny-wise by undue economy in the number of his watchers. His keepers' cottages are distributed strategically, so as to command all the favourite resorts of pheasants and poachers. Night patrols are out and on the watch, who are presumed to study the art of surprise by keeping all their movements secret. If the man-traps and spring-guns that used to be advertised everywhere in the plantations are for the most part out of date, modern science has invented ingenious substitutes for them. There are wires arranged a foot or so from the ground, stretched stiffly among the sheltering undergrowth, so as to trip up intruders when they least expect it, with the chance of sending off their guns to the imminent danger of their comrades. And these wires act as so many bell-pulls, to set chimes pealing aloud when silence is eminently desirable. Another ingenious practical repartee to unwelcome intrusions is the dummy pheasants that are fixed up among the boughs in likely places. They betray the illicit sportsman into making much unnecessary noise, and he is lucky if his enemies are not actually watching the lure at the moment he commences his practice. On the other hand, as poachers generally go about preserves in gangs, the watchers must concentrate their forces in order to make a fair match of it, and hence there is an obvious opening for stratagem. False intelligence or a feint at some distant spot draws away the keepers from the real point of the expedition, and the birds they have been carefully rearing are dropped and bagged when their backs are turned. One can sympathize with the growing irritation of men who have repeatedly been tricked in that way by notorious characters as to whose identity they feel no doubt whatever, although they may only have suspicion and indirect evidence to go upon. It is a war of cunning and low intrigue which keeps up bitter feelings on both sides. Ten to one the keepers have secret service money at their disposal, which they lay out judiciously among frequenters

of the village public which are the poachers' houses of call. From time to time they pick up bits of information more or less trustworthy; although probably it is not very often that they succeed in bribing an active accomplice into treachery, for a good poaching connexion is much too lucrative to be risked for the sake of a stray half-sovereign or unlimited ale on some particular evening. In the days of stage-coaches there used to be some difficulty in disposing of the spoil, and the pheasants and hares were sold for what they would fetch to some one who charged exorbitantly for the risk of getting rid of them. Now that there are lines of railway leading in all directions, a light spring-cart carries the booty to a station, where it is stowed in the van as passengers' luggage; or it is consigned to a safe hand in the nearest market town, if not to a salesman in a large way of business in London. There is no tracing stolen property of this kind, or identifying the missing goods by making a descent on the receiver's premises. The money is duly remitted in exchange for the consignment; nor is much discount exacted on account of the illicit nature of the transaction. There is keen competition for supplies among the dealers, and we fear that the maxim of many of them is to ask no questions. In short, to reckless vagabonds of sporting tastes poaching would offer irresistible attractions were it only somewhat safer. As it is, the balance of objections to it is scarcely sufficient to deter the neophyte when once he has broken ground and been encouraged by a certain impunity. It is true that, to say nothing of the chance of being shot, it is not an agreeable dilemma to be reduced to choose between giving up your gun and your liberty or perpetrating murder. But then there are drawbacks to all trades; and the poacher may flatter himself that, with ordinary luck, he may run a long and prosperous career, indulging his inclinations for dissipation like his betters, with the minimum of honest exertion.

England has no special reason to be proud of her poachers, and there is very little romance about them. There are countries in which the poacher, in spite of a certain moral obliquity in his vision, is distinguished by his free and manly bearing. He is the pleasantest of all companions in his native mountains, and is so far an estimable member of society that you may safely trust him with anything but game. Readers of Mr. Bonar's book of sports in the Bavarian Highlands will remember the close friendships he formed with the "free shots" who took toll of the famous hunting-grounds there. Although they had the bloodthirsty habit of taking quiet aim at keepers whenever they sighted them, they were admirable as husbands, fathers, and in the domestic relations generally. They needed steady nerves and hands for their dangerous calling, and, so far as strict temperance went, they lived like anchorites, except on special occasions. So much could hardly be said for our own Highlanders, who used to stalk in the Scotch deer-forests as regularly as the legitimate owners. Living a life of rough exposure in their damp climate, they drank even more freely than their neighbours, arranging their nightly bivouacs when they could at one of those illicit stills which used to be so many centres of conviviality in the moorlands. But they had firm principles of their own, and a standard of respectability to which they acted up. They killed deer as their ancestors, the caterans, lifted cattle. A misadventure might chance to a keeper in fair stand-up fight, and they might make free with their rifles or their hunting-knives when their blood was up; but they would have scorned to shoot a man from an ambush, or to take advantage of superior strength or numbers to maltreat a man wantonly when he was only doing his duty to his master. Except for drinking as much as he can get, the low-country poacher is just the reverse of all this. He is essentially a sneak. He goes about during the day with a hand-dog expression that gives him a strong family resemblance to the down-looking lurcher he has left tied up at home. Not that he shows himself abroad in the daylight more than is necessary, and when you do get a glimpse of him, he is generally on the lounge. But, like Mr. Silas Wegg in *Our Mutual Friend*, he "takes a powerful sight of notice" in his own underhand way. He goes sauntering down lanes under cover of the hedgerows, past likely woods, listening to the crowing of the peasants; or he leans over a gate with hands in pockets and pipe in mouth, contemplating abstractedly the gambols of the hares. He starts and shambles on at the sound of a footstep, and has a slouch in his shoulders and a wriggle in his gait as if he were momentarily expecting a hand on his coat-collar. He is like a beast of the night compelled against his instinct to be abroad in the sunshine. Although he passes a good part of his days and nights in the open air, his face has a sodden, unhealthy tinge, and when he does raise his eyes you can see they are bloodshot. For the best part of his gains go in the public-house, where he and his comrades lay their heads together, blaspheming and whispering over pipes and pots. Naturally he is dissipated, for it is a necessity of his business to be thrown into company as bad as himself, or worse; and he primes himself with drugged malt liquors and fiery alcohol for his long excursions and vigils in the night air. He needs Dutch courage, too; for going after lawless objects in the stillness, and the darkness, with the not improbable contingency of being left crippled in a ditch or carried home on a shutter, would shake even stronger nerves than debauchery has left him. Sneaking about in constant apprehension or terror, he is of course savage when not sullen, and naturally he will nial a prostrate enemy remorselessly if he gets the chance. But it is his wife and family who have the worst of it, should he happen unluckily to be head of a household. It is not difficult to imagine what a home

his must be, when he seldom comes back to it except after a carouse or a lagging and anxious expedition. His family suffer alike by his good or his bad fortune. His example is bad enough for the parish in general, but what must it be for the boys who grow up under his roof? Something may be done perhaps now that schooling is enforced by statute; but vices propagate themselves more easily than virtues, and ill weeds proverbially spread and flourish. If opportunity makes the poacher even more than it makes other criminals, we cannot have much hope of the class diminishing so long as battues and high preserving are on the increase, and railways everywhere place preserves in the country in communication with the mining districts and the slums of manufacturing towns. And it can hardly fail to be largely recruited if strikes and lock-outs among the agriculturists throw able-bodied labourers out of work.

THE USES OF REGALIA.

SIR WILFRID LAWSON, who has a keen sense of the ridiculous, could not in a recent speech resist the temptation to have a hit at the absurd and fantastic parade with which a considerable section of his supporters think it necessary to carry on their agitation. He suggested that it was possible to protest against the liquor trade quite as effectually in a shooting-coat as in cloaks and sashes of many colours. It may be doubted, however, whether Sir Wilfrid would seriously desire that his admonition should be taken to heart, and that the Good Templars, Rechabites, and others should strip themselves of their finery. He would be glad, no doubt, if this foolish part of the business could be made less conspicuous, but he has probably a sufficient acquaintance with human nature to be aware of the danger of depriving his friends of one of the chief attractions of their propaganda. Any one who imagines that the decorations of the Templars are only an accidental superfluity must have an exceedingly imperfect conception of the real character of that body. The truth is that the regalia, as they are called, constitute the very heart and essence of the organization, which might perhaps contrive to exist with the help of the tinsel and coloured scarfs if teetotalism were abandoned for some other cry, but would be tolerably certain to decline if the stimulant of ornaments and titles were by any chance to be withdrawn. We say this of course without meaning to throw any doubt on the sincerity of the Templars. They are probably very anxious that total abstinence should be enforced, but when their enthusiasm on the subject is analysed, it will be found that a large part of it may be traced to enjoyment of the public parade for which an opportunity is thus afforded. Good Templarism would be a very dull affair without its badges, and flags, and orders of officers. The literature of the sect or order shows plainly enough the importance which is attached, and no doubt justly, to this part of the business. One of the principal by-laws of the Grand Lodge enacts that "it is imperative that regalia be worn in every meeting of the order at which any part of our ceremonial or unwritten work is used," but members are at liberty to appear in either officer's, Sub-lodge, Degree, or Grand Lodge regalia, as they may prefer. In one of the Templar newspapers we find a number of regalia-makers advertising their goods, and the manufacture of this new sort of Brummagem ware appears to have already become a large and prosperous trade. An officer's set of regalia costs, it seems, from 2*l.* to 5*l.*; an ordinary member's set in white from 5*s.* to 12*s.* the dozen; the second degree from 2*s.* to 10*s.* 6*d.* each; the third degree from 4*s.* to 2*l.* each; the Lodge from 1*l.* to 3*l.* each. It is significant that even children are turned to account as wearers of regalia, a set for an officer of this class running up as high as 30*s.* Another tradesman advertises "the largest and most varied stock of laces, braids, stars, fringe, gimp, tassels, rosettes, emblems, and every requisite for persons making up their own regalia—Bright! Cheap! and New!"; and, considering the number of Good Templars throughout the country, a great impetus must have been lately given to the trade in this sort of frippery. The flag-makers, too, have reason to be grateful to the Templars, who cannot get on without plenty of bunting. There is an "official T.O.G. flag," but members have also the fullest liberty to indulge their own tastes in regard to flags and banners. Since Father Mathew's day most of the Teetotalers have had a passion for medals, and this fashion seems to be as popular as ever. There is a large variety of "star, Maltese cross, and other badges," with which the Templars may decorate themselves at pleasure.

It will be seen therefore that a Good Templar is marked off from ordinary humanity not only by his peculiar views as to abstinence, and a proud consciousness of moral superiority, but also by great splendour of personal appearance. We suppose that it is only on public occasions that he comes forth robed about with sham gold fringe and worsted tassels, and glittering with medals, Maltese crosses, and all sorts of regalia in brass or tinsel; but there is no reason why he should not always go about in this way if he finds it agreeable. We are accustomed to hear complaints of the dulness and want of colour in English life, and some foreign visitors have been disposed to attribute to this cause much of the intemperance of the people; but this deficiency would be supplied if the Templars would only be good enough to bring a little of their gorgeousness into everyday use. As for the Templars themselves, although they do not sleep in their finery, the consciousness that they possess it probably never quits them for an instant, and gives them a sweet and constant sense of their own

importance. It is not merely the glare and glitter of the tassels that fascinates them, but the feeling that these things serve to distinguish the wearers from the common herd, and to place them on a more conspicuous social platform. However foolish the working-men and small shopkeepers who trick themselves out in this fantastic style may look, it must be admitted that this is a sort of folly of which they by no means enjoy a monopoly. In this instance the Good Templars have merely followed the example of the Freemasons and Foresters, who employ for convivial purposes the ceremonial and decorations which the Templars have now imitated as a means of promoting the cause of temperance.

The truth is that this sort of parade would seem to correspond to certain innate cravings of human nature which are common to most of us. Nobody is content to settle down quietly in the undistinguishable ruck of utterly obscure and insignificant humanity. To be a little higher or bigger, or at least more conspicuous, than one's neighbour is the great object of life; no matter how little the difference may be, it is always better than nothing. If a man has but a sheet of tissue-paper under his feet while there are other men standing on the bare ground, that is always something to be proud of as far as it goes. Even the savage takes pleasure in his stripes of paint or necklace of shells, not so much on account of their brilliant effect as on account of the sense which he has that they mark him off, if only to the extent of half a stripe or a single shell, as superior to some other barbarian. As the constitution of society becomes more democratic, the process of levelling provokes a natural reaction. The impression which some travellers have brought away from the United States, that in that country all attorneys are *ex officio* major-generals, though inaccurate in itself, is explained by the eagerness with which military distinctions are sought after by persons who otherwise would only be known by their names over their shop or office doors. In our own country the classes who are supposed to be pining for the abolition of the House of Lords can find no better way of consoling themselves in the meantime than by inventing titles and badges for their own use. The various degrees of membership and grades of officers among the Good Templars are doubtless much more attractive than the mere splendour of the insignia. If all the members held precisely the same rank, and wore the same uniform, they would enjoy the satisfaction of reflecting that at least they were entitled to hold their heads a trifle higher than the people outside who had no regalia; but the chance of rising to a higher grade in their own body exercises a much stronger and more insinuating fascination. We have no idea what may be the exact numbers of the Good Templars, but there can be no doubt that they must amount to many thousands. A year or two since, before this organization was invented or imported, all these people were languishing on a dead-level of dull obscurity. They lived, talked, dressed, and went about their business exactly like the rest of the great body of common people all over the country. All of a sudden the wave of Templarism has elevated them, be it ever so little, above the ordinary and commonplace multitude. They have flags, a fancy dress, and a jargon of their own. They can look down on people who are destitute of regalia, and whose low existence is not cheered and dignified by the prospect of possibly rising some day to be a W.C., a P.W.M., a V.V.O.T., or even a P.G.W.V.T. It may be supposed then that they are happier in proportion to their increased sense of their own self-importance and their superiority, if only by some infinitesimal fraction of an inch, over the rest of the community whose insignificance is so extreme that they are not even Templars. And if they really are made happier by this reflection, it may at least be said that it is, on the whole, a very cheap and innocent pleasure, and nobody else is any the worse for it. It is surely much better for working-men to spend their money in tinfoil and Brummagem bullion than in drinking vitriolized gin and hockessed beer. At the same time, there is no use in ignoring the fact that the success of the Templars is not exclusively due to pure philosophical enthusiasm.

The rapid development of Good Templarism in this country appears to supply an instructive lesson as to the means by which a cry of any kind may be made popular with the multitude. In the first place, the mere cry itself goes for something, because it bestows on those who cry it a distinctive character, and this is a little lift out of the ruck. Then there are the regalia, and the flags, and the medals, which are the outward and visible symbols of the new communion, and the grades of rank which every one may hope to scale. Nor is this all. The Templars have several weekly organs, in which portraits and biographies—the latter, it should be said, more flattering than the former—are given of the most distinguished—that is, most fussy and active—members of the body. To any one who has been oppressed by a sense of being utterly lost and confounded in a vast mass of people, all as common and undistinguishable as himself, it must be like the opening of heaven to find himself mentioned even in the most obscure of periodicals. And here it may be observed how trading interests come into play. Good Templarism has supplied an opening for various industrial enterprises in the way of newspapers, regalia, flags and banners, medals, and so on. There are Templar grocers, and printers, and hand-bell ringers, and a Templar Trade List is about to be published. A Life Assurance Office also pays special court to the Templars. It is perhaps only natural that the Templars should hold together in this way, and patronize each other. They will of course push the movement that gives them a new importance to the best of their power, and all the tradesmen

who are making a good thing out of it may be trusted to push it too. Templarism, in short, derives its strength, not so much from anything in the nature of its principles as from the skilful adaptation of its machinery to the wants and weaknesses of common humanity. The agencies which drag it might readily be harnessed to any other caravan. As the great Liberal party is still apparently much distracted as to the means of getting itself moved on a little, it is surprising that its managers should fail to observe the advantages which they might derive from taking a leaf from the Good Templars' book. The plan has been proposed of feeding up sound middle-class Liberals in clubs provided for the purpose with all the delicacies of the season and the choicest liquors, selected by committees of noblemen and gentlemen of the highest distinction. But perhaps the working classes might be more readily got at, and, from their numbers, they would be better worth having. All that would seem to be wanting is the invention of a dazzling set of Liberal regalia of the best tinfoil, with a corresponding hierarchy of W.O.'s and P.W.M.'s.

THE CAMBRIDGESHIRE.

THE Cambridgeshire seems to increase in popularity every year. The distance is just suited to the capacities of the greater number of racehorses in these degenerate days; the opportunities for speculation are so great, owing to the large number of competitors, that any horse in the race may be backed to win a fortune—and that consideration alone is unfortunately a sufficient inducement to make the present generation of owners of racehorses regard the Cambridgeshire with especial favour; and, lastly, there are usually so many false starts, so many disappointments during the race itself, and so much depending on getting off quickly and well at the fall of the flag, that the last of the great autumn handicaps at headquarters has come to be looked on as more of a lottery than any other event of the racing season, and, according to popular conviction, the issue of the contest is much more a matter of luck than of merit. We are not altogether satisfied that this popular conviction is well founded. On the contrary, experience would lead one to draw the paradoxical conclusion that the most uncertain race of the year not unfrequently resolves itself into an absolute certainty. Four years ago Adonis was a certainty; a year or two later Allbrook seemed equally a certainty, though the race was just lost by mischance; and this year *Peut-Etre*'s public trials during the Second October Meeting left no doubt that, if he did not tumble down, the Cambridgeshire was at his mercy. And, as he did not tumble down, the confidence reposed in him was amply justified; for, though opposed by as brilliant a handicap field as could possibly be collected, he won from start to finish without ever having to be called upon for an effort. It is a fact that there are races without number at Newmarket in which only three or four competitors take part, and of which it is more difficult to pick the winners than of the Cambridgeshire with its forty runners, when among them is an Adonis or a *Peut-Etre*. Nothing could be more decisive than the form shown by *Peut-Etre* in the Second October Meeting. It is true he was only fourth in the *Cesarewitch*; but it turned out that he was saddled so late that he had to be galloped at full speed from the hridge to the starting-post—a distance of two miles and more—and that he only just arrived in time to take part in the race. Defeat, under such circumstances, was not only excusable but inevitable. But, two days later, he won the Queen's Plate in a canter from Lily Agnes, presumably about the best three-year-old in training, Lillian, and Thunder; and again, on the following day, he beat Leolinus, Trent, Spectator, and Lacy, over the last mile and a half of the Beacon course. By these successes *Peut-Etre* incurred no penalty for the Cambridgeshire, for which his weight remained at 6 st. 10 lbs., or 18 lbs. less than was carried by horses of his own age, such as Lemnos and Newry. Having proved himself the superior, at even weights, of such tried public performers as Lily Agnes, Trent, and Leolinus, he had now only to fulfil his concluding engagement with a feather weight—a feather weight for a first-class horse, we mean—on his back. The Cambridgeshire is a wonderfully popular race with Continental sportsmen; and they not only enter their horses freely in it, but they are nearly always formidable in it. In recent years it has been won three times by foreign horses; in 1861 by Palestro, in 1870 by Adonis, and in 1873 by Montargis. Within the same period French horses have also run second on three occasions, Gabrielle d'Estrée in 1861, Cerdagne in 1869, and Finisterre in 1872. And this year *Peut-Etre* has won for the foreigners their fourth and their most easily secured Cambridgeshire. These continued successes will probably cause the handicapper in future to be cautious how he admits the French horses into their favourite race on lenient terms.

The popularity of the Cambridgeshire is shown by the fact that out of 189 subscribers only 58 declined to accept the handicapper's judgment of their representatives; while, despite the astounding revelation of *Peut-Etre*'s true form a fortnight before the race, as many as forty-two horses came to the post. As we have said, they formed an exceptionally brilliant field, and it may be worth while to glance at its composition. The horses over four years of age were represented by Finisterre, Laburnum, Khédive, Curate, Pearl, and Restless; and all of these were leniently weighted, for only once has the Cambridgeshire been won by an old horse. Old horses, in truth, seldom retain that dash of speed so essential in a

mile race. As they grow older, they get more pottering, as well as cunning enough to give up a struggle when fairly collarcd. Of the five-year-olds and upwards just mentioned Laburnum has been long known as a rogue on whom no dependence can be placed, and The Curate is one of those phantom horses who are always going to do a great thing, and who never do it. Yet one of this lot, Khédive, was so influentially supported that at last he supplanted *Peut-Etre* in the quotations, and actually started first favourite. It was currently reported that he had won such an extraordinary trial with Pearl that the latter could not win the Cambridgeshire with 4 st. on her back; and when Pearl won the Cambridgeshire Trial Handicap last Monday in a canter from Lacy and seven others, her stable companion Khédive naturally came into favour for the great race of the week. As a three-year-old Khédive showed fine form by running Queen's Messenger to a neck in the Prince of Wales's Stakes at Ascot, and at the sale of Lord Zetland's horses he was purchased for a large sum by Mr. Chaplin. But he has been long in retirement, and was believed to be unsound. After he appeared on the course we are astonished that he still retained his pride of place as first favourite; for he looked only half trained, and those who had seen him earlier in the day declared that he was lame and would turn out a second Mornington. They were not far wrong, for though he did not actually break down in the race, he never showed prominently in it, and a quarter of a mile from home was hopelessly beaten. The danger of trusting to infirm or bottled-up horses has been again strikingly illustrated in this year's *Cesarewitch* and Cambridgeshire. The four-year-olds formed a most powerful division of the field, and included many animals with considerable claims to notice. At their head was that great horse Lowlander, whose brilliant exploits at Ascot fully entitled him to the honour of being top weight in the handicap. At Goodwood, it is true, he showed but indifferently, yet the handicapper preferred to consider his Ascot victories before his Goodwood defeats; and it would be well if this principle of estimating a horse according to his best, not his worst, performances was more generally adopted. The four-year-olds also included Montargis, winner of the Cambridgeshire in 1873, and by many still considered the best of the French division; Franc-tireur, Hochstapler, Gamecock (third in the *Cesarewitch*), Flower of Dorset, Hesselton, and His Grace. The last named, who was let in at the low weight of 5 st. 10 lbs., was in the late Baron Rothschild's stables, and has subsequently, it is said, been used as a hack. So highly had he been tried with Walnut that the second in last year's Cambridgeshire, though by no means unduly weighted, was withdrawn in his favour. But he never was formidable in the race, and the fallacy of private trials received another illustration. Lowlander, Gamecock, and His Grace were generally considered the pick of the four-year-olds, but as the third in the *Cesarewitch* was suspected of being lame, and Lowlander's weight was more than had ever been carried to victory up the Cambridgeshire hill, His Grace was really the champion of this division of the field. The three-year-olds were a most formidable lot, and in addition to *Peut-Etre* we may mention *Aventurière*, the winner of the *Cesarewitch*, Lemnos, and Newry—the last one of the finest-looking horses at Newmarket—Benedictine, asserted to be the equal of Lily Agnes, and for a long time first favourite for the Cambridgeshire, Novateur and La Courseuse, Mr. Winkle and Mignonette. It had been confidently asserted that the last named was as good as, if not better than, *Peut-Etre*; but it seldom happens that there are two wonders in a stable at the same time. Both Lemnos and Newry were giving *Peut-Etre* 18 lbs., but despite such a disadvantage in weight the splendid appearance of Newry gained him many friends.

There is usually a long delay at the start for the Cambridgeshire, and a good many horses are started on the strength of the chapter of accidents which may happen at the post; but this year the principal delay was in the weighing-out department. It was very late before the numbers were hoisted; and even then the names of the riders were not exhibited at all. This was a great disappointment to a large number of racegoers, who habitually back jockeys' mounts, and reflects little credit on those who manage the details of business at the headquarters of racing. No one, for instance, knew exactly who was riding *Peut-Etre*, whose trainer had some difficulty in securing a jockey. As it happened, he was ridden by a comparatively unknown lad, and this circumstance, had it been known, would have probably driven the horse back in the market several points. In justice to the rider of *Peut-Etre* let us say that he did exactly what he ought to have done. All he had to do was to sit perfectly still and let his horse win, and this he did. We have seen a Cambridgeshire lost through a jockey beginning to flourish about when the race was in his hands, but the lad who rode *Peut-Etre* last Tuesday attended steadily to his duty without playing any tricks or attempting any show. The race was set at half-past two, a convenient hour, but even then a grey haze had spread over the flat, and prevented the spectators in the neighbourhood of the winning-post from obtaining any view of the competitors till they had fairly reached the crest of the hill. We shall not attempt, therefore, to give any detailed description of the race, but we may mention that, after an unusually short detention at the post, the starter was enabled to despatch the forty-two runners, and, as we are informed, on equal terms. We, like nine-tenths of the spectators, could see nothing whatever of the race except in the last quarter of a mile, and then there was little to see except that it was all over. *Peut-Etre* had decisively beaten everything, and had only to go on at his leisure and pass the judge's box two

lengths ahead of his nearest opponent. Lowlander made one grand struggle for the mastery at the top of the hill, but the weight was too much for him, and he was not ridden out for a place. The place honours were obtained by two extreme outsiders, Chieftain and Lord Gowran, but Lowlander and Aventurière were probably second and third best in the race. Khédive and His Grace were among the first beaten, and it was such a case of hare and hounds in the last quarter of a mile that a great number of horses were not unnecessarily persevered with.

REVIEWS.

GREEN AND GROSE'S HUME.*

THE present editors of Hume's *Treatise on Human Nature* take a somewhat peculiar course. They consider Hume to have been the last great English philosopher, and the study of Hume to be a matter of exceeding importance. But his greatness consists in their eyes simply in the thorough fearlessness with which he carried out Locke's principles till they stood self-condemned; and the important thing to be known by studying him is the final *reductio ad absurdum* of empirical philosophy. Accordingly Mr. Green's introduction to these volumes is not an exposition as we understand the term; for an expounder is one who puts himself, for the time at least, in the author's place and tries to assimilate his thought that he may help others to assimilate it. What we have here is a controversial critique from the transcendental point of view. We have reasons which will presently appear for doubting whether, even from that point of view, it was altogether advisable to do this particular piece of work. Apart from these doubts, Mr. Green seems to have done it with much diligence and ability, and not without the true speculative faculty that sees through half-answers. It is dangerous, however, to make sure that one understands another man's philosophical criticism, especially when one entirely disagrees with him on the fundamental questions of philosophy. Seeing that we have the misfortune so to disagree with Mr. Green, we think it best to say at once that we have often found his writing hard to understand, and that it is very possible that in sundry places we have misunderstood him. Or rather let us say that the root of the whole difference between the empirical and the transcendental philosophy is in truth a misunderstanding not to be removed by argument. The discussion of all the disputed points comes round to this at last. The transcendentalist says there must be an explanation of everything, and defies the empiric to explain the nature of things. He asks:—"Why do you not explain this and that? You stand confused before the necessities of thought, and I cannot understand how you pretend to get on by the mere light of finite experience." The empiric answers to this effect:—"I do not explain this and that because at present I cannot; moreover, for all I know, there may be no explanation at all. If you ask me why some things appear at present inexplicable, I can only say, according to the nature of the case, either that the question is unmeaning, or that I do not know; and if you find any amusement in asking me why I don't know, and so on *ad infinitum*, you are very welcome. In the meantime my finite experience gives me light enough to do my work by, and I let your necessities of thought take care of themselves." From the metempirical point of view, the worth of empirical inquiry is that it leads to glaring contradictions which drive one to take refuge in transcendental ways of thinking; from the empirical point of view, the worth of metempirical criticism is that it drives one to cast off all remnants of metempirical thinking and confine oneself strictly to answering intelligible questions in terms warranted by experience. However, when we come to arguing in detail, the fundamental opposition is easily lost sight of or obscured; hence there is much confusion and fighting at cross purposes. One adversary challenges another to prove something which is alleged by that other to be above proof, or to disprove something which is alleged to be unmeaning; and they minutely criticize each other's solutions without reflecting that they are speaking of different things all the while, inasmuch as they are hopelessly at variance as to the form in which the problem should be stated.

It seems to us that Mr. Green's dialectic is not free from this kind of irrelevance, which practically amounts to unfairness. For it is quite fair to put a question in your own way; but when a man tells you he cannot answer it in that way, and goes on to put a question superficially like it in his way, it is not fair to complain of the answer he ultimately gets for being an answer to his question and not to yours. Now Hume is, on the whole, as explicit as most writers in telling us what sort of questions he does not mean to answer. But Mr. Green's criticism often slides unconsciously from dealing with the sufficiency of Hume's results as answers to Hume's questions into dealing with their sufficiency as answers to Mr. Green's questions. And, if not quite fair to Hume, this is still less fair to empirical philosophy, which now claims to explain definitely many things which Hume could not but leave indefinite, and some things which he could not explain at all. It is curious that Mr. Green takes no

notice whatever of these modern developments, beyond a general statement to the effect that Hume's followers have done nothing but beat about the bush and attempt to escape from his conclusions, and an obscure allusion to a "rougher battery" opened on popular psychology by the physiologists. For anything that appears in the discussion, Mr. Green might never have heard the names of Herbert Spencer, Darwin, or Lewes. As editor of Hume he is indeed not bound to know more than Hume did; but as a controversial writer with Hume for text he stands otherwise. Probably he would say that the empirical philosophers we have named have added no real speculative elements to the dispute. But this is the very point which we call on the transcendentalists to make good. Of course we are not surprised when incompetent writers prefer marching over the ground their enemy held the day before yesterday to attacking the position he holds to-day. But we confess to some surprise when we find a serious and competent person like Mr. Green even seeming to do such a thing. Not that we think it would be impossible to answer a good deal of Mr. Green's criticism without going beyond Hume, though it would be a delicate and difficult task. Many objections are, as we have said, only restatements of the fundamental difference between the two ways of thinking; and at most of the places where modern thinkers would call in the doctrine of evolution, we conceive that Hume could have said (if he did not actually say):—"This is one of the things I do not pretend to explain. I do not say that there will not be an explanation of it some day." And at such places we should so far agree with Mr. Green as to think that Hume was perfectly right in not attempting any explanation at the time. However, we can here undertake no more than to state in our own way the remarks which occur to us on some of Mr. Green's arguments. We can find no room to deal with the introduction to the second volume, which concerns the moral part of the treatise; nor do we much regret it, since the conditions of ethical controversy are now so transformed by the theory of evolution that minute discussion of the older forms of empirical morality is not likely to be very profitable for the future. We will first take a passage which appears to put Mr. Green's general habit of thinking in a fairly clear and compact form:—

The quarrel of the physiologist with the metaphysician is, in fact, due to an *ignorantia elenchu* on the part of the former, for which the behaviour of English "metaphysicians," in attempting to assimilate their own procedure to that of the natural philosophers, and thus to win the popular acceptance which these alone can fairly look for, has afforded too much excuse. The question really at issue is not between two co-ordinate sciences, as if a theory of the human body were claiming also to be a theory of the human soul, and the theory of the soul were resisting the aggression. The question is, whether the conceptions which all the departmental sciences alike presuppose shall have an account given of them or no. For dispensing with such an account altogether (life being short) there is much to be said, if only men would or could dispense with it; but the physiologist, when he claims that his science should supersede metaphysics, is not dispensing with it, but rendering it in a preposterous way. He accounts for the formal conceptions in question, in other words for thought as it is common to all the sciences, as sequent upon the antecedent facts which his science ascertains—the facts of the animal organization. But these conceptions—the relations of cause and effect, &c.—are necessary to constitute the facts. They are not an *ex post facto* interpretation of them, but an interpretation without which there would be no ascertainable facts at all. To account for them, therefore, as the result of the facts is to proceed as a geologist would do, who should treat the present conformation of the earth as the result of a certain series of past events, and yet, in describing these, should assume the present conformation as a determining element in each.

To begin with the end of this, the simile does not go on all fours, as indeed no physical simile in metaphysical matters ever does. It is made plausible by a tacit substitution of *each* for the *description of each*. With the latter reading we can at once accept the proposed absurdity as true. The geologist must think and speak in language, and we admit, or rather maintain, that the present conformation of the earth (as we may practically call it) has been a determining element in the formation of language. If the earth were not what it is, man and his language would not be what they are. We must think of and describe the past world in terms of the present world. We cannot tell how it looked to its lords and masters the monstrous *effs*, but only how it would have looked to us if we had been there to see. We cannot look forward or backward without carrying our present organized thought with us. Our conception of the world before man existed may be called a fiction in Hume's sense, or, as Mr. Lewes has it, an ideal construction; and yet it is true, for it accounts for our past and present experience, and enables us to predict future experience. Taking the simile thus, we have really dealt with Mr. Green's main objection in the form of a particular case. For the gist of the objection, as we take it, comes to this—we cannot state the facts of psychology on the empirical hypothesis except in terms which are themselves determined by the facts. This is perfectly true. No empirical thinker will now deny that we inherit a highly organized mind, and that a great part of our thinking has been settled for us by our ancestors, or, to speak more accurately, by the mutual reactions of ancestral organisms and their environment. We profess only to give what may be called an historical account of the manner in which our present habits of thought came to be organized; and we admit that for the purposes of this account we must assume the popular belief in an external world. Thereupon the transcendentalist turns round upon us and tells us (as Mr. Green does elsewhere) that our world is "an arbitrary fiction," and our science "a mere language, well or ill constructed, but unaccountably and without reference to things." Having committed ourselves too far to be frightened by epigrams, we reply that the fiction is in practice found to be useful. Moreover, the fiction is not

* *The Philosophical Works of David Hume*. Edited by T. H. Green, Fellow and Tutor of Balliol College, Oxford, and T. H. Grose, Fellow and Tutor of Queen's College, Oxford. Vols. I and II. (A *Treatise on Human Nature*, &c.) London: Longmans & Co. 1874.

arbitrary, the science is well and not ill constructed, just in so far as it is constructed accountably and with reference to experience. If we are asked why it occurs to us to assume a real world, we can only give another historical answer. As a matter of fact, man has for countless generations been a social animal; and the belief in consociated life other than his own individual life, and consequently in a real world common to his life and others—the world in which you and I get on together—is now deeply rooted in every man's mental organism. We frankly concede that it is impossible by mere force of logic to prove to any one that there is anything real outside his own mind. In short, assuming a real world, we claim to be in a fair way to show how our thought has become organized in the world, and how the world, as we know it, is again modified by our organized thought. All this, as it seems to us, is rather beside the purely metaphysical question of the external world, save that it helps one to see, as Hume clearly saw without our present helps, that the only rational form of putting that question is the subjective one. The question, Do external things really exist? or, Why do things exist? is idle and unintelligible; the question, What do we mean by *existence* or *external reality*? is intelligible.

This last is, in truth, the question which Berkeley set himself to answer, and went far towards answering rightly. This seems the best place to say that we distinctly claim Berkeley as an empirical philosopher. Even Berkeley's notion of spirit is not a transcendental assumption, but something which he thought he could find in experience. Mr. Green seems willing to let us have him, for he speaks of Berkeley with very slight respect. He blames Berkeley (so far as we can understand) for not having answered the other or wrongly put question; this we have already pointed out as the general form which transcendental criticism of empirical thinkers is apt to assume. In fact, Mr. Green repeatedly says in different words that Locke, Berkeley, or Hume, as the case may be, does not assign any reason why there should be any order of nature or why it should be what it is rather than anything else. For our part, we see no speculative way to finding such reasons, and we are content to say with Spinoza (whom we also claim as an empiric in all material points) that the order of nature as a whole is ultimate and inexplicable. We have now tried to show in outline our general dissent from Mr. Green's mode of thought; and, having done so, we hope to be the better understood when we go on another time to more particular comment.

SAMUEL LOVER.*

WE know not how many of our readers will be familiar with the name of Samuel Lover, or will remember anything more than that he was the author of certain popular songs, and of a novel or two of what is called Irish humour. In addition to these claims to reputation, Mr. Lover was also an industrious miniature-painter; and for some time gave one of those "entertainments," after the precedent of Mathews, which have been popular both in England and America. If such a man had been allowed to pass away without any record of his activities being preserved for the benefit of posterity, we cannot say that we should have been sensible of a great literary void. Men of higher reputation are still in want of a biographer. Mr. Bayle Bernard, however, is of opinion that a biography is needed. Mr. Lover, he tells us, was a "poet, novelist, dramatist, painter, etcher, and composer"; and this "variety of gift" was "the directest challenge to that division of labour principle which forms the law of modern excellence." It might possibly be said that the result of the challenge was not favourable to the challenger; for Mr. Lover can hardly be described by his warmest admirers as a leader in any department of artistic excellence. Mr. Bernard, however, has his answer. Genius, he admits, generally implies concentration. But it may also be "diffusive." "Power may diminish with diversity, but it is a phenomenon after all that only divides in its particulars to reunite in its sum. Such was the case with Lover." We must admit that after some reflection we are unable to assign any meaning whatever to this remarkable sentence. If it meant to say that a man who is a third-rate novelist, a third-rate poet, and a third-rate artist is thereby entitled to be called a first-rate man of genius, the meaning would be obviously absurd. And yet we are unable to suggest any other meaning at all relevant to the question.

The conclusion is, anyhow, that Mr. Bernard resolved to write a book. He found, however, on inquiry that materials for it were wanting. Mr. Lover had left no letters, no papers, and no journal worth mentioning, and had only just begun to write some reminiscences of his childhood. Mr. Bernard found therefore that his whole materials reduced themselves to an article in the *Dublin University Magazine*, written a good many years before Mr. Lover's death, another sketch by a connexion, making some remarks upon the article, the fragmentary reminiscences, and the "domestic memoranda" which he calls journals. In other words, he had substantially no materials at all except an old magazine article. Mr. Bernard, however, was not to be daunted by such a trifle. "It is obvious," he says, "that the documents described 'required considerable addition and connexion to give them the substance and interest which a biography demands.' In other words, as Mr. Bernard was determined to prepare a dish without any meat, he had to make it entirely of sauce. Such literary

cookery may succeed at times in skilful hands; though it is hardly fair to call the result a biography. Mr. Bernard, however, had known Mr. Lover for a good many years; he had taken an interest in Irish novels and songs, and he had been to America. With the qualifications thus naively described he has put together between three and four hundred pages more or less distinctly referring to Mr. Lover. We will try, however inadequately, to give some impression of the result.

"Samuel Lover was born in Dublin on the 24th of February, 1797." That is the best sentence in the book. It gives a relevant fact without superfluous verbiage; and we doubt whether a Boswell or a Johnson could have materially improved the statement. The first two chapters tell us that Lover was a delicate and over-sensitive boy; and was therefore sent to live in a farmhouse for a year or two at the age of twelve. Here he entirely regained his strength, and was ever afterwards a healthy man. In these chapters Mr. Bernard has the advantage of a fact or two in Mr. Lover's reminiscences, which are not entirely swamped, though they are pretty deeply imbedded, in some remarks about Irish society at the time of the Union, about "Fighting Fitzgerald" and "Tiger Roche," and such worthies, which are apparently introduced to remind us that Mr. Lover was either not born at the time described, or was too young to be interested in such scenes. Then, however, we come to the most important three years in Lover's life. He resolved to leave his father's office and to learn painting. Unluckily, all that Mr. Bernard can tell us about his hero's proceedings is that he does not know precisely when Mr. Lover took this resolution—one person giving his age as sixteen, and another as twenty-three—nor how he lived, nor where. We do not even understand whether Lover left his father's house, or only his office. The safe conclusion at which Mr. Bernard arrives is, that somehow or other Lover got enough to eat, or, to speak in Mr. Bernard's beautiful language, to obtain "that most agreeable illustration of the doctrine of continuity—an unbroken succession of dinners." The space which would have been occupied with young Lover's adventures is therefore occupied by a long rhetorical description of the astonishment which the proceeding must have caused to the older Lover, and by a discussion upon Irish art in general. Lover, at any rate, became by degrees a popular miniature-painter in Dublin, and was introduced to good society. Moreover he sang a song of his own composition at the dinner given to Moore in 1818. He was encouraged to the performance, it seems, by champagne, and we suspect that the same influence must have stimulated the applause bestowed upon a set of boyish verses beginning

"O'er the day Jove exclaimed with a nod most profound,

and continuing in an easily imaginable strain. Lover continued to live in Dublin till 1833. He married in 1827; and he became popular as a writer of small songs and stories. Mr. Bernard does not seem to know any particular facts about this part of his career; but he fills a good many pages by remarks upon the Irish temperament, by a survey of Irish songs in general, and some quotations from Mr. Lover's performances in that line. At one period, indeed, Mr. Lover began to keep a book in which he entered the smart sayings which circulated in Dublin society. Some are old—as, for example, the familiar story about Wolfe's praise of Gray's *Elegy* on the night before his great victory; and we cannot say that any are very good. Moreover Lover was a member of a grotesque convivial club, founded by Lover, the fun and facetiousness of which are long since utterly dead. In 1833 the miniature of Paganini, which he had painted, had a great success at the Royal Academy, and this seems to have determined Lover to migrate to London.

Here, as he comes within reach of Mr. Bernard's personal knowledge, we may expect the record to be rather fuller; but, on the whole, we have rather less of his personal history than before. Two chapters are eked out by a survey of Irish fiction, making us feel a guilty sense of ignorance in regard to that unparalleled blaze of genius, wit, humour, and pathos which illuminated the pages of Miss Edgeworth, Banim, Carleton, Griffin, Lady Morgan, Maturin, and others, but throwing very little light upon the author of *Handy Andy*. We gain perhaps a fresh idea of what Mr. Bernard calls "the calefactive depths of Celtism"; but we cannot at present communicate these new lights to our readers. We are next told that Mr. Lover was very popular in society, and to illustrate the excellence of his conversation we are regaled with two specimens of his "ready pleasantries," not, we are happy to say, the best, but those which recur to Mr. Bernard. A lady told him that she admired the Irish so much that she thought she was meant for an Irishwoman. "Cross the Channel, madam," he replied, "and millions will say you were meant for an Irishman." Another lady, being complimented on the passion which she had thrown into a song, said that she was as cold as "that marble"—pointing to a mantelpiece on a summer day—"and that's cold enough," I suppose. "Not always," replied this brilliant wit, "the fire has got to be lighted." A few stories are thrown in of Douglas Jerrold's witticisms, of which we can only say that, like most of Jerrold's recorded witticisms, they show that an alternation of puns and sheer rudeness is often taken for genuine humour. Jerrold, for example, found a man reading a stupid poem at a club, and dragged him up to its author, exclaiming, "Mr. So and So, allow me the pleasure of introducing you to your public." It would have been just as witty to say, "Mr. So and So, you are a fool," though the rudeness was intensified by knocking two people's heads together. After a good deal about songs in general—"songs," we are informed, "have their place in human

* *The Life of Samuel Lover.* By Bayle Bernard. London: Henry S. King & Co. 1874.

history"—and a brief notice of Mr. Lover's pictures and publications, we come to the part of the history for which Mr. Bernard has proclaimed his special qualifications. Mr. Lover's eyes became weak, and he resolved to increase his income by giving an "entertainment." Like other men of greater reputation, he went to America to perform, and, as Mr. Bernard has also been in that rarely visited country, there is a good excuse for accounts of its less familiar phenomena. We are told, for example, that Americans are hospitable, though externally cold, and that they have a characteristic humour, this statement being illustrated by some of the usual facetiae. At last Mr. Lover gets to the Falls of Niagara. We are then duly told that so much has been said of these falls that Mr. Bernard can scarcely expect to be more successful in describing them; language, in fact, is inadequate for the purpose; they are therefore described once more. We are reminded that "we live in an age of science," and have therefore discovered that ninety million tons of water descend the falls every hour; and we are further informed that M. Bloudin crossed them on a rope. At last Mr. Lover returns to England, and the last twenty years of his life, in regard to which one would think that the materials must have been more abundant, are summarily despatched in a short chapter—though even this chapter includes a long discussion as to the true definition and characteristics of the Irish lyric.

A second volume is filled with some sweepings from Mr. Lover's drawers, of which we shall only say that they may possibly be interesting to people who hold that Mr. Lover was a great writer, and that therefore every scrap from his pen is worth reading. One other remark must be added. The book itself, considered as a literary performance, is plainly one of those which ought never to have been written. The style is pompous, and sometimes ungrammatical, and the substance is an incoherent mass of what may pass for tolerable criticism. However, Mr. Bernard has a perfect right to publish a flimsy volume if he pleases. We merely wish to protest against making poor Mr. Lover the excuse for such a performance. To all appearance, he was a good, amiable, and hard-working man, who was not, it is true, a great literary light, but who certainly deserves no blame for not excelling his fellow-creatures more decidedly. But when the few recorded facts of his history are made the nucleus for such a performance, it is impossible that a certain amount of undeserved ridicule should not be reflected on his memory. We have no reason to think that he was personally vain, or would have sanctioned such a use of his name. As a matter of literary morality, his presumable intentions should have been respected; and as he left no materials for a biography, a flatulent production of this kind should not have been tacked on to his name. All that could be said about him might have been easily said in an article not longer than this review; and if such a notice had been prefixed to any of his works which may still be read, ample justice would have been done to the subject. Biographers have long been a nuisance, and the more flagrant cases of unnecessary biography should be noticed with the blame they deserve.

SEEBOHM'S PROTESTANT REVOLUTION.*

THIS is another volume of the same series to which Mr. Cox's book on the Crusades belongs. It starts with the apparent advantage that its author is known to have given special attention to one part at least of the subject which he has taken in hand. Mr. Seebohm had studied the Oxford Reformers, though few could see any reason why he called them the Oxford Reformers. The name gave everybody quite a different idea of the subject of the book from what it really proved to be. This fancy for giving queer names seems still to follow Mr. Seebohm. We get the Oxford Reformers again, though Mr. Seebohm does once or twice show some little doubt whether they ought to be called Oxford Reformers. And we get other names which, as they are used, are even less to the purpose. No one would quarrel with any one who, once in a book, in a rhetorical passage, spoke of the Papacy as "an ecclesiastical empire," and the act of the nations which throw off its yoke as a "revolt." The phrases suggest a real and important analogy. The later spiritual dominion of Rome has much in common with the earlier temporal dominion of Rome, and the likeness between the two is well expressed by the words "ecclesiastical empire." But the phrase is essentially a metaphor; it is essentially rhetorical; and no kind of phrase is less suited to be used as a technical formula. Yet this is the way in which Mr. Seebohm uses it. In page after page we hear of "the ecclesiastical empire" and "the revolt against the ecclesiastical empire," as set technical phrases, just as one speaks of "the Thirty Years' War" or "the French Revolution." We can fancy the result in an examination, if one fell in with a number of candidates who had been reading Mr. Seebohm. Even the title of the book is an example of the same kind of thing. Why "the Era of the Protestant Revolution"? No one would quarrel with the phrase "Protestant Revolution," any more than with the phrase "ecclesiastical empire," as a rhetorical and metaphorical phrase used once or twice in the course of a book. But it does not sound well for a title. Why not simply "the Era" or "Period," or whatever word is best liked, of "the Reformation." We have often had our laugh when people speak of "the Reformation" in England as if it were a thing which happened in a definite year, as if the

changes which were the final result of thirty years of change backwards and forwards were all made by a single Act of Parliament. But the Era or Period of the Reformation is a phrase which is perfectly intelligible, and which can mislead nobody. It perfectly well describes a period of which the reformation of religion was the main business and the main result. It has become so completely a technical phrase as to be quite colourless and to commit one to nothing. We fancy that a reasonable Roman Catholic would use it without any scruple. But "Protestant Revolution" has a twang about it; it has a big sound, such as might easily win a cheer in a speech; it is not nearly so well suited for a technical phrase. Mr. Seebohm will perhaps say that by "Protestant Revolution" he means something more than the mere reformation of religion, that he wishes to mark the spirit of the age of which the religious reformation was only the greatest sign. But the Era or Period of the Reformation would be understood by everybody to mean a good deal more than purely religious changes; and to our mind the received and well-understood name does its work better than the new and somewhat startling phrase of the Protestant Revolution. One does not at first sight know exactly what is meant; some minds might perhaps be tempted to think that by the Protestant Revolution was meant the Revolution of 1688. But this way of speaking is characteristic of Mr. Seebohm throughout. He is fond of putting everything in what is meant to be a neat and precise, a new and a rather startling way; but as with many attempts at extreme system and precision, the result is often by no means really so clear as ways of speaking which do not in the same way suggest effort. We get tired of Mr. Seebohm's constant divisions and analyses and short pointed sentences. A simpler way of writing would do the work a great deal better. Mr. Seebohm's colleague, Mr. Cox, at least carries us along with him. Mr. Seebohm does not carry us along with him, because he is always stopping and pulling us up. All this makes the book somewhat unsatisfactory to read, and it is made still more so by Mr. Seebohm's attempts in the early part of it to go into a great many matters which were hardly needed for his subject, and which he does not thoroughly understand. We do not know what his line of study may have been besides those parts of history which bear upon "the Oxford Reformers"; but it is clear that he has not that kind of knowledge of mediæval history which was needed by one who undertook the first part of the book, the introductory part, containing the four chapters headed "The State of Christendom." Almost at the very beginning, when Mr. Seebohm gives a picture of the general state of things at the time that his supposed subject opens, we come across such a sentence as this. He speaks of the Saracen conquest of Spain, how the Mahometans still kept Granada, and then he adds:—

But whilst checked in the West, Mohammedan arms had recently been encroaching more and more upon Christendom from the East. Turkey and Hungary had fallen into their hands, and in 1453, i.e. in the lifetime of the fathers of the men of the new era, Constantinople had been taken by the Turks.

Now such a confused phrase as "Turkey" falling into the hands of Mahometan arms is almost worse than the talk to which we are used about Cæsar landing in England and the like. Then it cannot be said that all Hungary fell into the hands of the Turks, though the greater part certainly did; but that was not till after the Turkish conquest of Constantinople and the Castilian conquest of Granada, while anybody who read Mr. Seebohm's sentence would fancy that it happened before them. This however may be only a confused way of talking. But what are we to say to such a statement as this a few pages on?—

In addition to the parochial clergy, there were orders of monks. The two chief of them were the rival orders of Dominican and Augustinian monks; and in most towns there were one, two, or half-a-dozen monasteries and cloisters. So numerous were the monks that they swarmed everywhere, and had become, by the favour of the Popes, more important and powerful in many ways than the parochial clergy.

Now is it possible that there can be any man who thinks himself fit to write about the ecclesiastical history of the middle ages who really thinks that the Dominicans and Augustinians were the two chief orders of monks? A very strict censor might quarrel with calling either of these orders monks at all; but, without going so deep as that, does Mr. Seebohm mean Austin Friars or Austin Canons? Has he never heard of the Benedictines, the Cistercians, or, to get amongst friars, the Franciscans? It is possibly because Savonarola was a Dominican and Luther an Augustinian that the historian of the Protestant Revolution thought that those two orders must be the two chief orders. Then, what is meant by monasteries and cloisters? Is he thinking of the use of the German word *Kloster*? but in that case "Kloster" simply means the same thing as monastery. And what is meant directly after by saying that the clergy "alone baptized, they alone married people (though they unmarried themselves), they alone could grant a divorce"? Does not Mr. Seebohm know that, setting aside the possible power of the Pope to do anything, there was, under the system of which he speaks, no power anywhere of granting a divorce, in the usual sense of that word—that is, the dissolution of a marriage allowed to have been valid when contracted? Presently we read:—

There was yet another most numerous and most important class affected by feudalism—the peasantry. The peasants, under the feudal system, were more or less reduced to a condition of vassalage or serfdom.

Does Mr. Seebohm really think that vassalage and serfdom are the same thing, that a Duke of the Normans, for instance, was a serf of the King of the French? But this strange confusion runs through all Mr. Seebohm's book. He is always talking about feudalism and serfdom as if they had something directly to do

* *The Era of the Protestant Revolution*. By Frederic Seebohm. London: Longmans & Co. 1874.

with one another. Indirectly, no doubt they had a good deal to do with one another; that is, the state of things which we vaguely call feudalism undoubtedly tended to push down the free peasant into a serf. But serfdom and the feudal tenure of lands have really nothing to do with one another. Yet Mr. Seebohm throughout his book speaks as if they were the same thing. For instance, in p. 49, he says:—

Under the feudal law the feudal tenants might not leave their land.

And we see directly that by feudal tenants Mr. Seebohm means villains. Presently he adds:—

By the time of Henry VII. feudal servitude or villenage was at an end in England.

It most certainly was not at an end, though no doubt it ceased to be of any great importance or to affect any large class.

But we might really have expected that Mr. Seebohm would have had some notion of the nature of the Empire. All that he has to tell us is:—

The German, or, as it called itself, "the Holy Roman" Empire, was a power which belonged to the old order of things. Like the Pope of Rome, the Emperor considered himself as the head of Christendom. He called himself "Caesar," and "King of Rome"; and, as successor to the Roman Empire, which the Germans had conquered, claimed not only a feudal chieftainship over nations of German origin, but also a sort of vague sovereignty over all lands. As the Pope of Rome was the spiritual head, so the Emperor considered himself the "temporal head of all Christian people."

Does Mr. Seebohm know of anybody earlier than the son of the first Buonaparte who was ever called King of Rome? And really the distinction between a King of the Romans and an Emperor is not so mysterious but that it may be understood by an effort. Directly after this, Mr. Seebohm tells us that "Switzerland had indeed severed herself from the German Empire." The time when this happened is not told us, but from another passage it is plain that Mr. Seebohm thinks that the Forest Cantons threw off their connexion with the Empire at the time of Morgarten. Here is Mr. Seebohm's history of Switzerland:—

As early as the fourteenth century the Swiss peasants in the Forest Cantons had rebelled and thrown off the yoke of their Austrian feudal lords, and when the latter joined in a common cause against them, the Swiss were victorious in the battle of Morgarten, 1315. The Swiss had formerly belonged to the German Empire, and had the Empire done justice between them and their lords they would have been glad enough to remain free peasants of the Empire; but as the Empire helped their lords instead of them, they threw off the yoke of the Empire. They were soon joined by other neighbouring cantons, and their flag, with its white cross on a red ground, became the flag of a new nation, the Swiss confederacy, with its motto "Each for all, and all for each"—a nation of free peasants, letting out their sons as soldiers to fight for pay, and, alas, not always on the side of freedom!

Mr. Seebohm may possibly, like Sir Walter Scott, fancy that every Duke of Austria must be Emperor, and that every Emperor must be Duke of Austria, and so feel a little puzzled at the sight of Emperors or Kings and Dukes of Austria who were by no means on the best terms. But it so happens that for a long time the Confederates were on the best of terms with the chief of the Empire of which they still were members. Not even the legend of Tell himself can be so far from the truth as Mr. Seebohm's saying—when, according to all the rules of language, he must be speaking of the Forest Cantons specially—that "the Empire helped their lords," and that they threw off the yoke of the Empire. Has not Mr. Seebohm read how one of the alleged causes which led the Confederates into the Burgundian war was obedience to the bidding of "unser Herr der Kaiser," even though that Emperor was the Austrian Frederick the Third? Mr. Seebohm too seems to think that the Confederacy was wholly made up of "free peasants." Fancy the feelings of a patrician of Bern or Zurich on finding himself set down as a member of such a class. All these however are at most popular confusions which do not directly bear on Mr. Seebohm's immediate subject, and which he might have avoided by sticking more closely to that immediate subject; but we are amazed, when we get within his special time, to find the worthy Netherlander Pope Hadrian the Sixth set down as a Spaniard.

We have used up nearly all our space in speaking of parts of Mr. Seebohm's book which do not bear on his immediate subject, but we think that we have said enough to show that he is hardly a trustworthy guide; that he has, to say the least, undertaken to treat a subject without having thoroughly mastered it. We have read through the later part as well as the earlier, and we have looked specially to the part which concerns England. What strikes us there is the extreme meagreness of the account which Mr. Seebohm gives of the English Reformation. We hardly reach the stage at which we can begin to talk of accuracy or inaccuracy, there is so very little matter of any kind; yet the space which Mr. Seebohm has given to a long extract from Mr. Froude describing the death of Sir Thomas More would have given room, if room was what was needed, for explaining a great deal which Mr. Seebohm has slurred over. Still, that we may not part on altogether bad terms with Mr. Seebohm, we will end with an extract which puts forth a great truth plainly enough. At the beginning of one of his last chapters he puts the warning, "We ought never to forget that the Roman Catholic Church of our own times is, in fact, a reformed Church, as well as Protestant Churches." One of the greatest sources of popular error is identifying the modern Roman Catholic system, as fixed and stiffened at the Council of Trent, with the system of the mediæval Church before the Reformation. Against this error the words of Mr. Seebohm may serve as a useful protest.

HIKAYAT-I-ABDULLAH.

THERE is a certain class of Indian journalists who are often fretting because we cannot get a frank and decided exposition of native wishes and ideas. We might, they say, meet with some startling revelations. We should see a foreign rule painted in its true colours, with the light places all dark, and the shadows made a trifle darker; difficulties of administration might, however, vanish under the process, and financial problems would be triumphantly solved. It is admitted by these writers that our self-love might be wounded, and that we should find out that India is not to be governed by flowery minutes and laudatory Blue-books. But, at some loss of national vanity, we should know how we had failed in spite of excellent intentions, why we manufactured sandals that always pinched the wearers, how completely we misunderstood the Oriental temperament, how wrong we had been in prematurely forcing on the natives our insular maxims and our rigid rules. In short, we might be lucky enough to secure a genuine political treatise which should somehow combine the minute knowledge of Abul Fazl with the condensed thought and the pregnant maxims of Tacitus. These hopes will certainly not be realized by the publication of the memoir before us. Yet it is a novel, amusing, and an interesting book. The author was a Mahomedan, born at Malacca in 1797. His father came from the Deccan, or Southern India, and his grandfather was a pure Arab of Yemen. His mother was a Malay. Besides the Malay language, which he spoke from his childhood, he became a proficient in Urdu or Hindustani, in Tamil, one of the Dravidian languages, and in Arabic. He also appears to have acquired some knowledge of English. In 1843, being then forty-six years of age, he wrote his autobiography, and he died about twelve or fourteen years afterwards, at the age of fifty-eight or sixty. The work has been given to the world with a copious commentary on the sayings and doings of the author, by Mr. J. T. Thomson, who had known Abdullah in the Straits Settlements. Of the worth of his notes and explanations we shall presently speak. As regards Abdullah himself, we must at once state our belief that his disclosures will not make the task of governing our Oriental dependency one whit easier than it has been. He has not conveyed to experienced administrators any clue which they had not obtained previously, nor has he presented them with striking and original suggestions as to the proper mode of taxing aliens, or of using a giant's strength with equity and moderation. But his memoir abounds with genuine native proverbs and apt local illustrations. Several of his portraits of persons, obscure or eminent, are admirable. In spite of some exaggerations, which are too obvious to deceive, an air of earnestness and truthfulness pervades the whole memoir. And in his remarks on new discoveries, scientific appliances, and European skill and resources, there is a *naïveté*, a simplicity, and a candour which at times remind us of Herodotus. He appears to have been both a kind father and a good husband, and he shows a toleration on religious matters which, for one nourished in an atmosphere of bigotry and fanaticism, is as praiseworthy as it is rare.

The youth of Abdullah was spent pretty much like that of young Mussulmans in general. He was under the dominion of a father who certainly never forgot one of Solomon's excellent maxims, and of a preceptor who vied with or outdid Opilius and Squeers. But it was a proud day for young Abdullah when he drew out correctly, and without supervision, a bond for a sum of 300 dollars due from his father to a Chinese merchant. In Eastern countries, we should explain, practice in forms in use in legal and mercantile business is part of the scholastic course. To draw out a quitance, a lease, a mortgage, a petition asking for employment, a letter of thanks or congratulation, is in indigenous institutions as much a part of the regular work as are Greek Ianbics and Latin hexameters at Eton or Harrow. From this time Abdullah's destiny was fixed. He taught languages, and he drafted letters and papers. He was witness to the occupation of Malacca by the English, to the subsequent entry of the Dutch, and to their abandonment of the settlement at the close of the war. His capacity for business brought him in contact with councillors and governors, captains of ships, preachers of religion, active police magistrates, and hectoring town majors. Some of his portraits, if not absolute photographs, are quite equal to passages in *Haji Baba*, and are better than the recent Diary of the Shah. Colonel Farquhar, the Governor of Malacca, is described as a man of good parts, and of an open hand, who was accessible to every one, and who made no difference between rich and poor. He appears to have been one of those administrators who carried out literally Sir John Malcolm's maxim of "opening to suitors the four doors of the house." Sir Stamford Raffles is depicted in the same light. He was courteous, thoughtful, a naturalist, well versed in the Malay language, and very inquisitive about native customs and habits. His physique is described with a minuteness which would be offensive were it not for the good intentions and the evident sincerity of the writer:—"His brow was broad; the sign of large-heartedness. His head betokened his good understanding; his hair, being fair, betokened courage; his ears, being large, betokened quick hearing; his eyebrows were thick, and his left eye squinted a little"; and so on for half a dozen more lines. Lord Minto, who was Governor-General of India, and visited Malacca when Abdullah was about fifteen, was at first sight disappointing. The author had looked for a man of high stature, lordly bearing, and gorgeous dress. Instead of this he saw a man steep ashore,

* *Translations from the Hikayat Abdulla (Bin Abdulhader) Munsli. With Comments by J. T. Thomson, F.R.G.S., Author of "Some Glimpses into Life in the Far East," &c. &c. London: Henry S. King & Co. 1874.*

under the rear of cannon, who was "middle-aged, thin in body, of soft manners, and of sweet countenance"; but so slow were his motions, that "I felt he could not carry twenty cutties, or thirty pounds." However, the Governor-General seems to have won many hearts by his manners and address, though he wore only "a black coat, trousers the same, nor was there anything peculiar." Of the leading men, with the exception of Sir Stamford Raffles, none dared "to grasp his hand;" "they took off their hats and bent their bodies."

But every one was not kind and courteous like these mighty potentates. And the peculiarities of a certain Mr. B., a colonel or commandant of Sepoys, supply the materials for a very different picture. This person was "of a very mischievous and wicked disposition." He made his dog catch vagrants. He set little boys to fight for coppers until they got swollen faces and bloody noses; and wicked lads, who ran away from school, attracted by these coppers, collected there to spar, to the great terror of respectable people. When tired of miniature prize-fights, he induced all Malacca to begin cock-fighting; and then he let out ducks into the sea, chased them to spar, or fired at them with ball cartridge. As a climax of iniquity he appears to have anticipated Hurlingham, for "he bought wild pigeons, and when he was standing ready with his gun, he ordered his men to let them loose one by one for him to fire at. Thus some were struck and fell dead, others flew away." Also he shot apes, which, by the way, he would have done at his life's peril had there been a colony of Hindoos at Malacca. He squandered money amongst minions, and was "a scamp of a gentleman." We regret to say that idle subalterns at a loose end, in isolated cantonments, may have done this kind of thing. Dr. Milne and Dr. Morrison, of the London Mission Society, were great contrasts to this "scamp." The former "had the deportment of a gentleman." "Even in anger his countenance gleamed with mildness." The only fault of his colleague, Dr. Morrison, was that he wore the Chinese dress, doubtless to facilitate intercourse with men of that nation, and that "no one could have taken him for a white man." A Dutch Secretary named Maunboor (*Query Mynheer?*) had a pestilent activity and a mania for upsetting all that his predecessors had done. He sent some people to gaol for digging new wells or building new houses, fined others for leaving rubbish or dead rats and fowls in front of their houses, so that, when this active Secretary turned out, "the street would be chock-full of sweepers, making tumultuous noises." No wonder that "all races cursed him, and called him bad names." We much fear that the like has befallen active Chief Commissioners of Works, vestrymen possessed with a noble rage for sanitation, and heads of Local Boards. Then there was a wonderful doctor who "had a timber foot joined to his leg, but his knee was the same as ours," and he performed on Abdullah an operation which reads like tapping for the dropsy, and which resulted in a complete cure. A certain lieutenant, who was employed in making a chart of the coast, is described as "amiable and without clever," and as "not in any way like the usual class of sailors, rough, wicked, and drunken." Another missionary "had not the tone of a clergyman," which the author explains by saying that he had not the polish of Dr. Milne and Dr. Morrison. He smiled perpetually, and would wear spectacles, but, "by reason of his bad memory," he never succeeded in mastering the Malay tongue. Though he could read the characters, when "you asked him the meaning, he did not know; and when he spoke, his meaning could not even be guessed." All these portraits show discrimination of character.

If the judgments of Abdullah on men show a lively and minute observation, his accounts of things are not less graphic. The mysteries of Hindu caste astonished and repelled him more than would be the case in a Mussulman born and educated in any part of the Indian Peninsula. A detachment of Sepoys touched at Malacca on its way to Java, and in a description marked by some exaggerations, but full of lively incidents which will be recognized as true by those acquainted with Hindu tenets, he tells us how some Hindoos would not eat in the presence of spectators, or would cast their food away if you went too near it; how they stood in the water up to their waists, bowing, and muttering, and counting on their fingers; how splendid was the appearance and admirable the discipline of some three hundred Mussulmans whom by the description we take to have been high-bred Irregular Cavalry from Upper India; how big bullocks never moved a muscle when huge cannon went off close to their ears; how the horses of the cavalry obeyed the sound of the trumpet and manœuvred of their own intelligence; and how, at the close of the parade, English officers amused themselves and others by leaping their horses over fences "seven cubits high." Unluckily, the novelty of these sights was followed by a great rise in the price of provisions. Three eggs were sold for two *sempas*, or one shilling. Fowls rose to a rupee a piece, and the "mud fish in the creeks, in all their filthiness," were finished. At this time Lord Minto inspected the gaol, and was so horrified at seeing the instruments of torture left behind by the Dutch that "he gloomed heavily, and, spitting," ordered them to be burnt. He also made such a change in penal discipline that gaol, instead of being "such a place as hell is," became one which some men liked or had no fear of, openly saying "This is no punishment." Abdullah, however, is careful to add that he has no sympathy with such foolish notions, as "incarceration is in itself a punishment, and the gaol a place of infamy."

Certain aborigines known as the Orang Laut appeared to the author in their true character as rank pirates, with their cutaneous diseases and filthy habits. They were expert divers, and had no fear of sharks, which fish were pirates like themselves; but, oddly enough,

they did not claim kindred with tigers, one of which animals had lately carried off the uncle of one of the party. We take it that these wild men, like the Jamaica negroes, had become so expert in the water that they could defy the shark in his own element. The laying of the foundation of the Singapore Institute is very well described, with the ceremony of burying gold and silver coin in the centre of the first stone. In endeavouring to state the causes of an eclipse according to Hindoo notions, the biographer has fallen into an error which the editor has failed to detect. Popular belief said that the moon was eaten by a snake, and the word *ruhi*, says Abdullah, in the language of Hindostan means snake. Abdullah has here evidently got a confused notion of the demon Iahu, who, according to Hindu mythology, periodically endeavours to swallow the moon. But in trying to discredit this and other idle interpretations and to give the true cause of such a phenomenon, Abdullah found, he tells us, that his endeavours were like a "pot of fresh water poured into the sea; it also became salt, and my instruction had no result." There are several other pithy proverbs familiar to the Malays scattered over the memoir, which bear a family likeness to the sayings of Oriental writers of fables. Puffers are described as grasshoppers, who, in the place where there are no vultures, "are their own trumpeters, and call themselves vultures." Ill-nature is worse than a cutting instrument, for "knives and choppers may be blunt, but the mouths of mankind are very sharp." Again, by "a blue drop (*i.e.* a drop of indigo) spoils the milk in the pail," we are to understand the spread of contamination; and the old proverbs of the Ethiopian's skin and the leopard's spots appear thus in the Malay version, "If a crow were to bathe in attar of roses and to be fed on ambergris and musk, it would not make its feathers white, but black they would remain."

We should have been glad to award an equal measure of praise to the editor for his share in the work. But truth compels us to state that his views on politics are superficial, his reasoning disjointed, and his remedies silly. The translation is disfigured by slangy expressions at which Abdullah, who was something of a purist, would have been much shocked. The Greek proverb seems to us quite in point:—

πολλοὶ μαθηταὶ ἐκρίναντες εὐσεβέων.

The relative position of the Oriental and the European intellect has in this book been inverted, and it only remains for some native Munshi or Pundit to compose a treatise to show us how incoherent thoughts and rambling annotations may be compatible with the letters F.R.G.S. There are plenty of tirades about our misgovernment of the East, and in one passage the East India Company is described as made up of Radicals and Democrats. Now the old Directors, with many political virtues, had some faults, but they never erred on the side of haste and demolition. They were steady Conservatives in administration, and, as all who have studied their history know, tender to a fault where existing customs and native prejudices were concerned. The following remarks on the members of the Indian Civil Service need no comment. For any grace, elegant diction, and polished criticism, the passage might have been envied by the editor of the *Edinburgh Gazette*:—"They are narrow-minded, perverted, and jaundiced, superintending nose-grinders, termed members of the Civil Service." But what, indeed, can be expected of men "whose real capacity entitles them for the most part to perform routine duty," and who were surprised in the Mutiny "like the revellers of Babylon by Cyrus?"

The cures which Mr. Thomson suggests for these and other evils are as wonderful as his strictures. Ladies ought to marry "educated natives," and gentlemen should form "similar connexions"; and, "the bond of sympathy being thus practical, the superior mind of the white would enormously increase its functions." This is the way matters were excellently managed in New Zealand; and so forth. Then we are informed that Bass and Allsopp have a great deal to answer for in destroying the morale of the Indian army. Beer makes the system inert and obese, and predisposes to fever. It is also detrimental to sound habits and to self-respect. Mr. Thomson supports this powerful reasoning by an interesting anecdote of a European who always had a cool following him with a three-dozen chest of beer when he left his home. Unfortunately, the effect of this damaging piece of evidence is slightly marred by the admission that the gentleman was not a soldier at all. But Mr. Thomson is still quite ready to "vote that the beverage be abolished from the Indian army." In other respects the editor does not seem very highly qualified for his task. A little care and research would have cleared up some names or allusions in the biography which have been left obscure, though we readily admit that natives have a great talent for corrupting or disguising Anglo-Saxon phraseology. What Abdullah could have meant by the Hindoo year *Manuuda* and the month *Pertassia*, to use his own style, "cannot be conceived, even in a dream." But Mr. Thomson might have known that a celebrated collection of fables is not the *Panjatandaram*, but the *Pancha Tantra*; and the Mahomedan version of the same, which has no doubt got into Malay, is *Kahila wa Duma*, and not *Ghila dan Demina*. We should also like to have some other authority for the existence of "moose deer," which we thought peculiar to Canada and North America, in the Malay peninsula. Mr. Thomson further speaks of Sir Benjamin Malcolm as Recorder of the Straits Settlements. The gentleman intended is, no doubt Sir B. Malkin, afterwards one of the Puisne Judges of the old Supreme Court at Calcutta. But Mr. Thomson has never read, or, if he has, has managed to forget, the elegant inscription on this Judge's tomb

which was written by his friend and contemporary, Lord Macaulay. It has been published in Macaulay's miscellaneous writings, together with the epitaph on Motcalfe, and the inscription for Lord William Bentinck's statue. Still these blunders and the editor's disjointed style do not extinguish in us all sense of gratitude to him for giving us the perusal of an original and truthful autobiography which is more amusing than many tales of fiction.

GEIGER'S PEEP AT MEXICO.*

THAT part of the North American Continent to which Nature has been most kind was the first to be conquered by European adventurers three centuries and a half ago; and the sort of civilization which they founded seems likely there first to decay. In Mexico, as well as in Peru, the Spaniards arrived not in the character of colonists, but in that of invaders and supplanters, taking possession of wealthy and populous native realms. In Mexico, and likewise in Peru, the inherent vices of Spanish rule, both political and ecclesiastical, have resulted at times in a worse anarchy than has raged in other Spanish American States. Promises of amendment, as bondholders have proved to their cost, are frequent and emphatic in proportion to those financial needs which afford a fair measure of the civil disorganization. Perhaps the best that can as yet be safely asserted of the progress of actual improvement in those countries is the fact that railways have been constructed to their chief cities by Companies of foreign shareholders. This pledge of social order and prosperity, as many English men of business were not long since disposed to regard it, may be admired from the port of Vera Cruz to the capital of Mexico, along a line which does great credit to modern engineering skill. The city thus approached is a very grand and beautiful city, in spite of much that is squalid about it, like a robe of rich brocade with a train dragged in the mire. A traveller from Europe, entering the country on the Atlantic side, might, if so inclined, remark little to disturb his mood of complacent approval. But then he must not ask questions of any foreign residents in Mexico; and he must go no further from the capital than a jaunt to the palatial castle of Chapultepec, the shrine of Guadalupe Hidalgo, the shores of the adjacent lakes, or possibly even an ascent of Popocatepetl. That is what he might call a "Peep at Mexico"; but Mr. Geiger, though he was only five weeks in the country, took more than a peep at its front door and front parlour. He went in by its back door at Manzanillo, on the Pacific coast, and travelled through the neglected western provinces and the unsettled districts of the interior—unsettled in a different sense from uninhabited. Making his way to the capital by a tedious route through the States of Colima, Jalisco, Guanajuato, and Queretaro, he saw much and heard more that is unpleasant in the manners and institutions of this troublesome raw Republic. He felt indeed, in his very bones, the intolerable condition of the roads, which he denounces by almost every epithet that expresses the extreme of hatred, as wretched, barbarous, cruel, horrible, murderous, diabolical, and fiendish. Under these circumstances, it must be some consolation to him to have formed a theory which refers all that is amiss to one malignant agency. It is the Roman Catholic priesthood that must here answer for all.

The journey of Mr. Geiger from the western to the eastern side of Mexico was mainly coincident in direction with that of a lady two years before, whose *South by West* experiences and observations lately composed an entertaining volume, prefaced with an introduction from her near relation, Canon Kingsley. She was in the country a longer time than Mr. Geiger, and in the spring and early summer, from March to the middle of June. The middle portion of her route, between the towns of Guadalupe and Queretaro, diverged from that which Mr. Geiger followed, and therefore did not lead her through the important mining district of Guanajuato. This place, and the large manufacturing town of Leon, a day's ride distant from it, afford the best pictures of thriving industry in the States of the Mexican Federation. The entire State of Guanajuato, with a population of 874,000, is commended as an exception to that which may perhaps be styled, by a phrase parallel with the familiar proverb of the parent nation, "cosas de Mejico." This part of Mr. Geiger's information is supplementary to that which we gained so recently from *South by West*, whereas much else of what he tells us has been anticipated by that lively narrative.

Guanajuato has been famous for its mineral riches since the time immediately following the Spanish conquest. Its present yearly exports of silver and gold amount in value to six million dollars. The mine called La Valenciana, formerly the most productive, has long been filled with water in its shaft and tunnels, extending several miles, and to a depth of 2,000 feet. Within the last two years a Company has begun to pump out the water and to raise blocks of quartz for the crushing and smelting process, an amalgam of mercury and sulphur being used to extract the silver. The machinery, except that of the pumps, which are worked by a small steam-engine from Manchester, is dependent on mules for its motive power. Only the most promising pieces of ore go into the stamping-mills; and the houses of the miners' village are built with stones that contain undoubted veins of silver, not worth the cost of its abstraction. Whenever the Mexican Government shall take off the five per cent. export duty on this metal, or if its value shall from any cause suddenly rise in the world, it is likely that these cottages will be

demolished and literally converted into money, or else into spoons. We forbear to repeat what Mr. Geiger was told of the success and prospects of particular mines which are often mentioned in our own Share Market. He says there are more than a hundred mines in Guanajuato; and the detailed account which is appended to *South by West* gives fifty-two as the number in actual working. Those of Zacatecas, of San Luis Potosi, and of several other districts, make up altogether, by the same account, an aggregate Mexican silver product, coined and uncoined, to the value of forty million dollars. The transport of the precious metal from the mining districts to the capital is undertaken by the Federal Government, which levies a tax upon it for the service. The roads are always infested by robbers or revolutionists, so the convoy of waggons or pack-mules is guarded by an escort of soldiers. Mr. Geiger here repeats an anecdote very characteristic of the "cosas de Mejico." It happened once upon a time "that the Government themselves were in such urgent need of funds that they went through the force of an attack on the convoy, so as to secure the treasure. They, however," adds Mr. Geiger, "only considered it as a forced loan; for some time afterwards all the owners were fully reimbursed." A precedent or two might easily be quoted, from the European history of a remote age, for this humorous fiscal expedient. But it would not bear too frequent repetition.

The town or city of Guanajuato, founded in 1554, resembles some of those in old Spain in its architectural aspect. This is partly owing to its situation in the narrow ravines and on the steep slopes of three converging mountain glens, causing the houses to be crowded together as in the ancient walled towns of Europe, which were so often built at the confluence of streams breaking through the hills. Other Mexican towns are commonly placed on level and open ground, and laid out in straight streets of uniform width, with low, flat-roofed houses presenting only their large gateways and one row of barred windows to the street. Mr. Geiger's photographs of views in Colima, Sayula, and Guadalajara, among the numerous illustrations of that kind which adorn his volume, bear out his complaint of the monotonous appearance of those provincial towns. But one or two features which occur in almost every such town of Mexico would appear almost noble. These are the Cathedral and the Plaza, not to forget the Alameda or public garden. The last-named provision for the solace of townsmen, who are seldom oppressed with excessive business, is delightful, as might be expected in a country producing the loveliest flowers, shrubs, and trees of a semi-tropical clime. In their culture and artistic arrangement the Mexicans show much taste and skill. The public garden is also furnished with a fountain in a marble basin. The Paseo, a road or avenue shaded by trees for a promenade, is another pleasing adjunct to the ordinary town. In the Plaza or great square, of which Mr. Geiger photographs all the four sides at Colima, as well as in the metropolitan city, arcades of an elegant style, Moorish or Italian, support the fronts of good two-storied houses with shops below. The cathedral church, where there is a bishop's see, is a magnificent building, with a dome and a pair of steeped turrets, perhaps further ornamented with mosaics or coloured tiles. Such is a Mexican town. The interior of a house there is a secluded retreat, with lofty rooms opening to an airy verandah which surrounds the square yard or garden entered by a gateway through the building in front. At Guanajuato, where ground is scant, many houses are four or five stories high. There are here 63,000 inhabitants; but Leon, renowned for its leather, metal, cotton, and woollen manufactures, has a population of 100,000; and Guadalajara contains 75,000. The last-named city, which is the capital of the great province of Jalisco, boasts eight or nine weekly and half-weekly newspapers, a superb cathedral painted externally blue and yellow, an amphitheatre for bull-fights, which are disallowed elsewhere in Mexico, an opera-house, a well-managed hospital, a foundling hospital, an asylum for the aged poor, and a college for young ladies. These benevolent and educational institutions are praised by Mr. Geiger, as well as by the author of *South by West*. Yet the city where they are found, and the province of which it is the head, are esteemed the most lawless, lazy, priest-ridden, and bandit-ridden part of Mexico. In the most important local centres the foreign trade is chiefly in the hands of a few resident German merchants, but there are some French and English.

Brigandage and bad roads all over the country are the two great obstacles to the public welfare. In the better-governed province of Guanajuato, we are told, the administration has for many years been carried on by General Antillon, "who, unlike the majority of State officials, does not owe his position to guerilla or brigand exploits." The inference from this remark does not exactly fit Mr. Geiger's favourite theory that "every ghastly blot on modern Mexico is associated with the devastating influence of the clergy." By his own testimony, it is the "Liberal" party, in their heroic conflict with "Ultramontane machinations," who have frequently raised to the governorship of States men of "criminal antecedents" deserving "the treadmill." The priests and bishops, we dare say, have some of the faults of their order in Mexico as in other Roman Catholic countries. But it is difficult to see how they can desire to make the common highways unsafe for passengers and merchandize. It is more easy to understand why a "Liberal" captain of highwaymen, promoted to civil authority, should cast the blame of secular depredations on a priesthood so obnoxious to his political patrons. In comparing, however, these "cosas de Mejico" with the "cosas de España," or those of other European States, it is fair to observe that two-thirds of the whole population, which exceeds nine millions, are of pure Indian race. Two and a half millions are of mixed blood, and the creoles of

* *A Peep at Mexico*. Narrative of a Journey across the Republic from the Pacific to the Gulf in December 1873 and January 1874. By John Lewis Geiger, F.R.G.S. Trübner & Co.

pure Spanish blood are but half a million. The late President Juarez, "one of Mexico's noblest," was of the pure indigenous race. It is considered that the Mestizos, like the mulattoes in some West Indian islands, are the turbulent portion of Mexican society. Its composition altogether does not seem hopeful for national unity. And since the bond of Government administration is frail, while that of a common religion is relaxed by the discredit into which the Church has fallen through political partisanship, the Republic has no assured prospect of peace. But the tragic death of Maximilian, and the ignominious failure of Napoleon III., will deter the most enterprising of princes and statesmen from any future attempt to provide a ruling monarchy for this extremely independent country. Its more recent history may perhaps be described as a Mestizo edition of that of Spain, but without the Carlists, and with Intransigentes only of that primitive type who claim the stoppage of coaches on the highway. An occurrence of this nature is what the Mexicans understand by a "novedad," or simply an incident, just as the Southern Italians mean a stabbing murder when they speak of an "accidente." This Mexican "novedad" is something less than a novelty, though it may amount to stripping ladies all but naked upon the road after killing their husbands or other male companions who have ventured a defence. The English lady we have quoted, and her American lady friend, carried pistols to aid the rides with which the gentlemen of their party were armed.

Under these circumstances the traveller for pleasure who would enjoy "a Peep at Mexico," without being too much jolted and not improbably robbed, is advised to eschew the "South by West" route which takes him in the back way, from the San Francisco steamboat. Let him just run up from Vera Cruz by the railway to the capital, ascending two grand natural terraces, from the "tierra caliente" to the "tierra templada," and from this to the "tierra fria." This is a road of 263 miles passing from the luxuriant groves of tropical vegetation below to that fair upland valley, 7,600 feet above the sea-level, which is favoured with the most agreeable and healthy climate upon earth. The scenery is described as far excelling, in its wild and mighty loveliness, that of central and western Mexico. For it includes the glorious snow-clad cone of Orizaba; the mountain passes of Chiquibute, the Infierillo, and Maltrata, with amazing views of forest, rock, and river; and the rapid ascent of those "cumbres," or huge land-steps, which rise 2,000 feet and 4,000 feet within a very few miles of zigzag climbing. It is certainly worth while to go up to the city of Mexico, which has great beauties of situation and of structure, besides its romantic associations with Cortez and Montezuma, and the popular historical narrative of its conquest. Mr. Gieger's photographs of the city and its neighbourhood are acceptable, but his description is poor. Indeed, both in style and matter, and in spirit also, his book is very inferior to that of the young lady whom Mr. Kingsley introduced to the world. But he confirms the truth of her account.

THOMAS'S DIOCESE OF ST. ASAPH.*

THE see of St. Asaph is indebted to Mr. Thomas for a History the like of which in scope and magnitude we cannot call to mind in the case of any other English diocese. This work, which after several years of unremitting labour he has at length brought to a close, is no mere annotated Clergy List, or illustrated record of a Diocesan Church Building Society, but an able and thorough synopsis of the history of the diocese of St. Asaph, ecclesiastical and civil, as well as ecclesiological and literary, from the time of its foundation by Kentigern, when its cathedral was a frail framework of wood and wattle of the type of Melverley, to the present time, when the material fabric is at least seemly and substantial, and when, after an interval beginning with the translation of Bishop Wynne, the diocese possesses once more a Welsh-speaking bishop. Gifted with a spirit of keen antiquarian research, a perfect knowledge of his native tongue, and an industry guided by tact and ability, Mr. Thomas strikes us as having produced a model for other diocesan historians, at the same time that he has furnished a body of excellent matter for the antiquary, the topographer, and the general reader.

It is beside our purpose to devote more than a glance, in passing, to Mr. Thomas's clear and comprehensive sketch of the history of the see. He puts before his readers each successive landmark of the annals of the diocese distinctly yet succinctly, not stinting statistics when he has to deal with the Taxatio of Pope Nicholas in 1288-1291, as an index to the value of chapter, parochial, and monastic incomes at that day, or when he has to handle, by way of comparison, the Valor Ecclesiasticus of the 26 Henry VIII., as the standard of church revenues and contributions to the State some two hundred and fifty years later. Mr. Thomas knows how to vary such details by occasional episodes of a lively character, as, for instance, where he narrates the controversy between Bishop Anian II. and Giraldus Cambrensis, the doughty Archdeacon of Brecon, about the jurisdiction of Kerry (pp. 37-41); the raids and retaliations of Owen Glyndwr, whose method of persuading Bishop Trevor to side with him was by burning his cathedral (p. 67); the desecration of St. Asaph by the Puritans; and the well-meant endeavours of Bishop Lloyd to persuade the Quakers. He also gives biographical notices of those great agents of spiritual enlightenment in Wales, the translators of the Bible and Prayer-Book into Welsh, William Salesbury, Bishop Richard

Davies, Dr. William Morgan, and others, as well as of the holders of the see who have attained a name as literary divines, from Reginald Pecock down to Isaac Barrow and Beveridge. Especially candid, too, is his examination of the rise, progress, and prospects in St. Asaph of Dissent and Methodism, with his honest estimate of the work of Charles of Bala, and his acute perception of the strength and weakness of the system, which has since been cumbered and embarrassed by the admixture of politics and finance.

Those who take up this volume as a handbook to the ecclesiology of the diocese may perhaps think that the first dozen chapters present details to be skipped, or at least cursorily glanced over; and yet these chapters contain the key to a great deal of the obscurer parts of the parochial history which follows. It is essential, for instance, to understand the action of the Popes in support of the heads of monastic houses claiming a right to presentations to benefices, as against the Crown and the bishop of the diocese, before we can trace the anomalies of patronage in particular cases; to realize the twofold aspect, civil and military, of such parishes as Denbigh, in the early times, before we can account for its parish church standing a mile without the walls, whilst St. Hilary's, the large church on its height, is the ancient garrison chapel; and, again, the relation of divers smaller churches to their *collegium*, once nearly coextensive with the mother parish. All these things are explained in the chapters to which we have referred; and it may be added that the historian does equal justice to the material and spiritual aspects of the subject. Thus, when in pp. 68-9 he records the material church-building spirit which marked in St. Asaph the cessation of the Wars of the Roses and the establishment of the Tudors on the throne—a spirit evinced by the rebuilding of the cathedral, as well as by the churches of the Stanley series at Mold, Holywell, Northop, Gresford, Llangollen, and elsewhere—he is led at once by a natural transition to consider the spiritual restoration of the primitive Catholic faith, just then waxing into assured form and consistency.

The original cathedral, probably the "Pauperula sedes Llanelyensis" seen by Giraldus Cambrensis, and that destroyed by fire by the soldiers of Henry III. in A.D. 1245, was, as we have said, of the type presented by the existing church of Melverley, and of the same character as the original church at Meifod, called Eglwys Gwyddfarch after the hermit supposed to have built it for his oratory. A visit to Melverley, the "sea-like place," as the name in Welsh imports, on account of its frequent flooding by the Severn and the Vyrnwy, which here approach their confluence, would show a structure of timber framework bound together longitudinally and compacted internally by two rude beams dividing the body of the church into chancel and nave and ante-chapel. The interspaces of the walls are mostly filled in with "wattle and dab," and the whole is as quaint and antique as Troystan, over the border in Salop, was in time past. The cathedral was again destroyed by fire in A.D. 1278, applied to it by a sailing party from Rhuddlan, and again in 1402, through the vengeance of Owen Glyndwr. The present edifice represents in the main Bishop Redman's restoration of 1482; and the renovation of it under the direction of Sir G. G. Scott, now receiving its finishing touches, will entitle it to hold up its head amongst the cathedrals of Wales.

If we pass by the cathedral, and the kindred churches of the Stanley series, two distinct types seem to mark, each in its special district, a large portion of the diocese of St. Asaph. The visitor cannot fail to be struck, if, beginning with the Welsh, or "parish" church of St. Asaph or Llanelwy, he inspects the ecclesiastical architecture of the Vale of Clwyd, with the predominating characteristic of two equal and parallel arches, and commonly, as at Caerwys, Rhuddlan, Abergele, and Cilcain, with a tower at the western end of the north aisle. These aisles are mostly separated by pillars, clustered as at Llanelwy, octagonal as at Whitechurch or Llanfurchell, the extramural parish church of Denbigh, or in one or two cases like Caerwys and Llanarmon yn Iâl, simply of oak, more or less wrought. Llanasa, Llansilio, Llanrhaidyr, Chirk, and Hope preserve the same common feature amidst many notes of distinction, and it has been laudably respected in the restorations which are the rule, almost without exception, of the diocese during the present century. The other feature is peculiar to Montgomeryshire and its border, and consists of a wooden belfry, not infrequently of two stories, at the west-end, either surmounting a stone tower or run up, as was the case at Llandysil till 1866, from the ground within, touching the western gable wall, piercing the roof, and then expanding into an open gallery running round and a double roof above. A wooden of this is given in p. 328. The church at Kerry still retains its massive western tower with the double belfry as Giraldus saw it in 1176, and with a peal of bells representing those which helped to settle the dispute which he describes, "when, 'simul omnes triho intervallo,' they tolled out the solemn and awful clang" (p. 322). The old church at Newtown, and that at Llanfuir, have the same distinguishing feature, to which we may add the belfry at Mynydd, and that which till the beginning of the century existed at Berriew. The church of Llansantffraid yn Mechain retains still its spire-topped wooden steeple, supported by a massive timber framework of the true Montgomeryshire type. In this district, too, we note that the spirit of restoration has respected the characteristic feature which makes an old Montgomeryshire church unlike aught of more modern construction. The parts of the diocese where, save in traditions, the church is least rich in ancient or restored edifices, are the rural deaneries of Llanrwst and Penllyn

* *A History of the Diocese of St. Asaph, General, Cathedral, and Parochial, With Illustrations.* By the Rev. D. R. Thomas, M.A., Rector of St. Mary's, Cefn. London: Parker & Co. 1874.

and Edeirnion. It is true that in the former we have the parish church of Llanrwst with its beautifully carved rood-loft and screen and graceful bands of vine pattern, as well as its Gwydir chapel, memorable amongst other things for its Jacobean woodwork. But for the most part these churches on the mountain border depend for interest on the traces of St. Winifred, as at Gwytherin, or of the warrior saint Dorfel Gadarn, as at Llanderfel, although this last has of late years been well restored. *Appropos* of Llanderfel, Mr. Thomas has thrown curious light upon St. Dorfel's horse, a wooden image in a recumbent position, which had a solemn place in the church until at least 1730. It was really the dismembered trunk of the effigy of a red stag, an offering to the patron saint, who, like Cynfran, Sior, and others, was traditionally associated with pasture and the chase as well as the pastoral staff. This red stag Mr. Thomas suspects to be the counterpart of the white stag which legend connects with the foundation of Llangar church, as having set the boundaries of the parish (p. 711), as also perhaps of the "white hind" associated with Selattyn, and of Ethelred's milk white doe, still seen in a fresco on the walls of St. John's, Chester. While mentioning the Jacobean woodwork in the Gwydir chapel at Llanrwst, we may add that at Denbigh, Gwyddelwern, Llanfair, and elsewhere, there are beautiful specimens of this kind of church-fitting. At Rhug, a chapel attached to Corwen, there is also a very curious display of Jacobean carving and painting, bearing date 1637. Mr. Thomas omits to mention, in reference to this, a singular candelabrum of woodwork, apparently of the same date, and embellished in a like fashion with the rest of the woodwork.

It is impossible within our limits to notice a tithe of the points of interest associated with the churches of St. Asaph. One of Mr. Thomas's merits consists in the evenness of treatment which does as much justice to the remoter and less memorable parishes as to the noble churches of Whitechurch, Mold, Gresford, Wrexham, and other similar glories of North Wales. Of the first of these, the sculptured stone corbels, and the bosses ending the rafters, as well as the grotesque figures of animals in the grooved wall-plates, are perhaps the most striking feature. Mold, with its nave divided from the aisles by seven arches supported on clustered columns with sculptured capitals of animal and floral life, its clerestory windows, banded beneath by stonework quatrefoils and panelling, and its shield-bearing angels between the springs of every arch, is justly deemed one of the most perfect churches in the Principality; while Gresford, with its beautiful fifteenth-century additions (the upper part of the tower, the rood-loft, screen, perpendicular roof, chantries, and painted glass windows) to the fabric of the thirteenth century, is a sight not to be forgotten by those who have once gazed on it, any more than Wrexham, with its elaborate and beautiful tower of the same period. Mr. Thomas says of Gresford:—"The tower is set off with pinnacles and battlements, and upon the latter, as well as on the face of the buttresses at the angles, stand carved figures of angels, warriors, and kings. Traceried bands, quaint gurgoyles, and hollow cornices adorn its four sides, and these last, carried round the entire church, represent, as at Mold and elsewhere, a chase of cats, mice, dogs, and grotesque creatures." It is worthy to rank with Wrexham, which is perhaps seen to more effect from its situation, and which justifies to the full, by the numerous figures adorning its canopied shrines, the quaint description of old Churchward:—

Trim pictures fayre in stone on outgide are
Made all like waxe, as stone were nothing deare.

With such types before them it is but meet that the magnates of the diocese should emulate each other in grand and worthy restorations; and in fairness it may be said that the new churches at Bodelwyddan, Cefn, Trefnant, Llandulas, &c., show a spirit not unworthy of the old church-builders in the diocese.

A great help to Mr. Thomas in writing the history of the diocese must have been his knowledge of the Welsh language, which enables him to settle debated questions, and to throw curious light upon dubious localities. In such names as Owri, Nantglyn, Bettws, Kerry, and Rhuddlan, it is some natural feature which has given the church and parish its name. Ocerwys and Bodfari are names traceable to Roman antecedents. Efenechtyd, in the Vale of Clwyd, may be identified with the Gwytheriac nunnery mentioned in an old document, as much through the signification of its name as through its ancient knocker on the door, illustrative of the parable of the Ten Virgins. Disserth, Ruthin, and Denbigh derive their names from their military aspect, being respectively the steep fort, the red fort, and the hill fort. The former name of Denbigh is said to have been Caledfryn, or "the rocky hill." Ruthin is an instance of a military capella converted into a parochial church, and eventually swallowing up the tithes of the mother church Llanrhyd. Very interesting, too, is the light thrown upon the various Cambro-British saints, and such early missionaries as St. Germans, their churches, crosses, and, more than all, their wells. Touching these last alone an article might be written, full of interest. But the readers of the *History of St. Asaph* will find it pleasant work to make out all these bypaths of ecclesiology for themselves, and we can promise them that Mr. Thomas is a no less lively than laborious guide. Nowhere does he neglect a quaint legend or an apt anecdote. Anent Whittington Church he chronicles Robert Montgomery's description of himself, whilst a curate there, as "an oak in a flowerpot"; and, as a commentary on the legend of the old vicarage house at Bettws Abergele—

Vicar Jones and Vicar Sampson
Joined their pence to build this manseion—

he cites, with mingled accuracy and humour, an old terrier of 1729-30, which shows the mansion to have been 13 yards long by 44 broad, with a thatched roof and the living rooms floored with lime. The work has been carried through the press with considerable pains and care, and deserves a place in the libraries of all who are curious in the history of the Church in Wales.

TRANSATLANTIC PEDIGREES.*

MANY indications appear of the interest taken by Americans in genealogy and private history. We open at hazard the *Book of the Hudson*, published a few years ago, and find a view of the residence of Colonel Peter Schuyler, of the Flats, the first Mayor of Albany, who as Indian Commissioner took four sachems of the Mohawks to London, and presented them at the Court of Queen Anne. "After his death, his son Philip, the well-beloved of the Mohawks, who married his sweet cousin Katrina, the 'Aunt Schuyler' immortalized by Mrs. Grant of Laggard, resided there." It appears that Mrs. Grant wrote a pleasant book called *Albany Society a Hundred Years Ago*, which, with genuine American exaggeration, is said to have "immortalized" an ornament of that society who is mentioned there. We turn two pages and find a view of the "Van Rensselaer Manor House," and an explanation of the title of "patroon" and the manorial privileges which belonged to the owner of that estate. It appears that Killian van Rensselaer, pearl merchant of Amsterdam, became, under charter of 1629, proprietor, jointly with three other persons, of a tract of land upon the Hudson containing over 700,000 acres, and in him as "patroon" were vested civil and criminal jurisdiction and "feudal honours." In the Manor House, as it is still called, is a part of an illuminated window which for 190 years occupied a place in the old Dutch church. "It bears the arms of the Van Rensselaer family, which were placed in the church by the son of Killian." A few pages further on we are told that the right bank of the Hudson near Katskill "is distinguished for old and elegant country seats, most of them owned and occupied by the descendants of wealthy proprietors who flourished in the last century, and were connected by blood and marriage with Robert Livingston, a Scotch gentleman, of the family of the Earls of Linlithgow, who came to America in 1672, and married a member of the Schuyler family, the widow of a Van Rensselaer."

We may be sure that the Hudson is not the only American river on which "manor houses" still exist, and the memory of, or belief in, pedigrees is cherished. It need not therefore surprise us that a bulky and costly volume has been published purporting to contain the names of the emigrant ancestors of many thousands of American families. The book is dedicated to the Genealogical and Historical Societies of America, to whom the lists of names, of which it principally consists, will probably be more interesting than they can be to us. It is indeed possible that the inquiries in which these Societies delight may be pushed too far. A pedigree should not always be accurately investigated, unless the explorers are prepared to accept unpleasant truths. The book before us contains "lists of the living and dead in Virginia" in 1623-4, and it is open to present citizens of that State to make such selection of ancestors from these lists as may appear feasible. We may remark, however, that a recent book on *The English Colonization of America during the Seventeenth Century* contains statements as to the early settlers in Virginia which may deserve attention. This writer claims to have "carefully searched for facts." "Myths," says he, "creep into history," and he has employed his "hard steel pen" in tearing away the delicate web with which imagination has surrounded the beginnings of a great nation. The example he selects from "the accomplished Bancroft" is that of John Rolfe, an amiable enthusiast who had emigrated to Virginia hearing a voice crying in his ears that he should strive to make Pocahontas, a young Indian maiden, a Christian, and his wife. This is the substance of the account given by "the accomplished Bancroft," but this author states, as the result of his research, that Rolfe was a married man some years before this union. We do not know whether it is Bancroft or another writer who describes John Rolfe or Pocahontas, or both, as "constrained by the love of Christ"; but it is only too probable that both the method and language of Brigham Young were to some extent anticipated by the early pioneers of civilization. As regards Rolfe, the evidence produced by the author shows that he came with a white wife to Virginia in 1610, and had then a child by that wife, that he was married to Pocahontas in Virginia in 1614, brought her to England in 1616, and had a child by her. She died in England in 1617, and in 1622 Rolfe died, leaving a wife and children, besides the child he had by Pocahontas. It is consistent with these dates that Rolfe's

The English Colonization of America during the Seventeenth Century. By Edward D. Neill, Consul of United States of America at Dublin. London: Strahan & Co. 1871.

The Original Lists of Persons of Quality, Emigrants, Religious Exiles, Political Rebels, Serving-men sold for a term of years, Apprentices, Children Stolen, Maidens Pressed, and others who went from Great Britain to the American Plantations, 1600-1700; with their Ages, the Localities where they formerly lived in the Mother-country, the Names of the Ships in which they embarked, and other interesting Particulars. From MSS. preserved in the State Paper Department of Her Majesty's Public Record Office, England. Edited by John Camden Hotten. London: Chatto & Windus. 1874.

first wife may have died before he married Pocahontas, and that, after the death of Pocahontas, he married a third wife and had children by her. But the story is perplexing, and it is difficult to believe that Rolfe did not commit bigamy in marrying the Virginian "princess," as she is called, "for the good and honour of the Plantation." It appears, moreover, that Sir Thomas Dale, the "religious and valiant Governor" of Virginia, proposed to marry a sister of Pocahontas, having at the time a wife living in England. On the whole, it would seem that the critic is nearer to the truth than the historian. Bancroft also states that the settlers of Maryland were "most of them Roman Catholic gentlemen," and the same critic says that he has reason to believe that these settlers were chiefly poor labouring men and Protestants.

It would be well if poor labouring men had been the worst material used in building the colonial edifice. But if the settlers were such as this author describes, we may be less surprised than he is at the "draconian code," as he calls it, which was enacted for Virginia. This code of 1612 prescribes death for blasphemy, and, on a third conviction, for profane swearing. For a want of proper respect to a clergyman one was publicly whipped, and obliged to ask pardon in church for three successive Sundays. The penalty for not attending church and the Sunday catechetical lesson was for the first offence the loss of a week's provisions, for the second whipping, and for the third death. If the colonist upon his arrival refused to go to the clergyman to give an account of his faith, he was daily whipped until he complied. If a washerwoman stole the linen of an employer she was to be publicly whipped. A baker who sold loaves below the standard weight was liable to lose his ears. The description given two years before by Lord Delaware, Captain-General of Virginia, of the community over which he ruled might, according to the ideas of that time, justify this severity. It is not, says he, an hundred or two of "debauch hands," ill provided and worse governed, men of distempered bodies and infected minds, whom no examples either of goodness or punishment can deter from habitual impiety, that must be workers in this glorious building. He wants "men of quality, and painstaking men of arts and practices," but he would not altogether exclude "gentlemen." By "men of quality" he appears to mean men of character as opposed to "debauch hands," and his appreciation of "gentlemen" does not greatly differ from that of an emigration agent of the present day. "Gentlemen" are an article of which a new colony may easily have too much. Notwithstanding the Captain-General's preference for "men of quality," he was obliged to yield to the resolution of the Home Government to shoot the moral rubbish of England on Virginia. King James I. sent a man "suspected of deer-stealing" for transportation to Virginia. The word "transportation" was not at this time used, as it afterwards came to be, in a penal sense. A poacher might make a useful settler, and at worst he would only imitate other colonists who preferred hunting to clearing and tilling ground. But soon afterwards the King informed the Virginian Company "that he wished divers dissolute persons transported," and the Company answered "that it would be very acceptable to the colonists to receive them as servants."

The author of the book from which we have quoted is described as Consul of the United States at Dublin. It can hardly be doubted that he writes with satisfaction the words "From this time there were two distinct waves of immigration, the educated and religious preferring the Northern because King James had made the Southern a penal colony." We do not suggest that he has intentionally dealt unfairly with facts, but he may have been insensibly biased in his conclusions by the passions and prejudices excited by recent strife. "Early in 1620," he says, "the first large instalment of vagabonds and destitute persons arrived in Virginia, and yearly their numbers increased." He quotes from a contemporary poet a wish that Jove

Would move King James, once more, to store that clime
With the Moll Outpurses of our bad time.

But the poet's wish seems to apply to America generally. This is not the only instance in which a partiality may be suspected for the North. The author says that "the social position of the settlers in the Northern colony had been far superior," and he instances the Deputy Governor of Massachusetts and a settler at Salem who were married to daughters of the Countess of Lincoln. But surely against this may be set Lord Delaware, the Captain-General of Virginia, and George Percy, brother to the Earl of Northumberland, "one of the original settlers" in that colony. Thus Virginia can show two colonists of noble birth against two colonists of New England whose only nobility was gained by marriage. Still we cannot but give weight to the evidence of Sir Josiah Child, who wrote in 1698 that "Virginia and Barbadoes were first peopled by a sort of coarse vagrant people, vicious and destitute of means at home." The author states, we presume as the result of his own examination, that records show that Edinburgh used to banish what are now called unfortunate women to Virginia; and it is easy to understand that planters would accept any labour they could get, particularly as we find that in early years very few negroes were imported.

Upon the question thus arising the bulky volume lately published throws little light. We can see that there was considerable mortality in Virginia in the years to which it refers, and we find large numbers of "servants" on the muster-roll, of whom some, but scarcely all, may be what in newer colonies were called convicts. The names in the lists are ordinary English names which supply little indication as to the class, and none at all as to the character, of the colonists. Indeed this volume is as

barren of interesting facts as any that ever came under our notice, but if the genealogists of Virginia are as clever as they are said to be, they may perhaps discover in these dry records a significance unperceived by us. Almost the only part of the book that can convey any distinct impression to the ordinary reader is the "lists of convicted rebels sent to the Barbadoes and other plantations" after Monmouth's defeat in 1685. Not that even here the mere names convey ideas, but the business-like character of these records forcibly supplements the picture of the Bloody Assize which we find in Macaulay's pages. Thus we have "Sir William Booth's List of Prisoners." It would seem that Sir William Booth was a merchant or planter who invested largely in white slaves. The names and former abodes of a lot of ninety rebels are given, and we find men from Chard, Tauton, West Zoyland, Humpill, Burnam, Corfe, Creech, and many other familiar names. They were "shipt at Bristol," which was a great port for slave-dealing, white and black, and they were "consigned for the Barbadoes." Then there is a deposition by the chief mate of the ship that "the above convicted rebels" are "the very same rebels" that have been by him landed at this island, and delivered to Mr. John Brown & Co., factors for Sir William Booth, Knight, except thirteen out of the ninety, who died upon the voyage. Mr. Rose of London, and Mr. Nephew, appear also to have been large dealers in this commodity, which was made the subject of "invoices" and "bills of lading" like any other merchantable article. Macaulay bases his account of the sufferings of these "rebels" on their voyage partly on a manuscript narrative by John Coud, "an honest, God-fearing carpenter," who joined Monmouth, was badly wounded at Philip's Norton, was tried by Jeffreys, and was sent to Jamaica. One might understand better after perusing such a record the meaning of that text of Scripture which speaks of the "bread of affliction and the water of affliction" as prisoner's allowance. In those days, indeed, before philanthropy was invented, the petition in the Litany "for all prisoners and captives" had more significance than it has now, for, if Heaven did not help those who found themselves in gaol or transport-ship, they must have fared badly. Perhaps the "honest, God-fearing" ploughmen and artisans of Somersetshire did not live long enough in Barbadoes to qualify the character which the island seems to have derived from "the loose vagrant people" who first settled there. It appears from the parish register of Barbadoes for the year 1680 that by this time negroes had been imported to an amount more than threefold that of the "bought servants" who were supplied from England. It might be a curious inquiry whether convict labour in the American or West Indian colonies ever produced anything like the valuable results which are ascribed to it in Australia. Transportation to the American colonies continued until the Declaration of Independence, and among the colonies which received convicts were Delaware, New Jersey, New York, and Pennsylvania. The early colonists considered that the labour of convicts would be more beneficial to an infant settlement than their vices could be pernicious. But the importation of negro slaves soon lowered the value of convict labour, and it was thought dangerous to mix white men in a state of slavery with an increasing black slave population. A writer on this subject concludes that when no better labour was to be had the colonists were glad to take convicts. If this were so, it appears hopeless to represent the Southern States exclusively as receptacles of English outcasts. Perhaps the less said on the subject the better, but it connects itself rather disagreeably with any discussion on transatlantic pedigrees.

ROBY'S LATIN GRAMMAR.*

(Second Notice.)

IN selecting the dative from all the cases treated of under the head of noun-inflexions, we hoped to compress our remarks on this part of Mr. Roby's book into as short a compass as possible, and so to leave room for a notice of the other parts of the Syntax. But we fear there may be some amongst our readers who are not sufficiently familiar with Latin grammar, especially as it has been treated of late years, to appreciate the skill with which Mr. Roby has separated and discussed the two uses of the dative which he has called the dative of indirect object and the predicative dative. And as he has devoted some thirty pages of his preface to the illustration of this subject, we should scarcely be doing justice to him if we did not attempt to explain his view at greater length. For probably there is no part of his work which has been more elaborated than this. The term predicative is used, not as synonymous with, yet for the most part corresponding to, what have been called "datives of the purpose." The two following sentences when compared together will aptly illustrate the significance of the name, which is an invention of Mr. Roby's:—

Maximum vero argumentum est naturam ipsam de immortalitate animarum tacitam judicare quod omnibus curæ sunt et maxima quidem quæ post mortem futura sint.

and—

Magnæque esse argumento homines scire perique antequam nati sint quod jam pueri ita celeriter res adripiant.

* *A Grammar of the Latin Language from Plautus to Suetonius.* By Henry John Roby, M.A., late Fellow of St. John's College, Cambridge. In two Parts. Part II. containing Book IV., Syntax; also Prepositions, &c. London: Macmillan & Co. 1874.

Or perhaps a still better illustration will be found in the following:—

Illis . . . inimicorum injuria probro non fuit . . . tamen scelus meum probrum putas esse oportere?

Mr. Roby speaks of this dative as being used predicatively, or, to use his own words, "The word put in this dative is a name of the thing or person of which it is predicated," and in this he thinks lies the characteristic note of the usage. He has taken the trouble to collect all the instances he could find of its use, to the number of nearly two hundred, under the heads of the different nouns so used. He thinks the list of predicative datives is tolerably complete, and undoubtedly we are unable to gainsay this position, though the smallness of the number does not seem to us such matter for wonder as Mr. Roby finds in it. Though the usage was fully developed at the time when Roman literature begins—for Plautus, he says, uses between forty and fifty words in this dative—the class of words which can occur in this relation is necessarily restricted within narrow limits, inasmuch as the usage scarcely extends beyond what he calls semi-abstract substantives, such as names of actions, effects, feelings; such, for instance, as *curæ*, *odio*, *præsidio*, *usu*, *more*, *iudicio*. It is confined to the singular number, which again is natural when the abstract nature of the words so used is considered. He instances, amongst other contrasts of singular and plural, that *voluptati* is so used, but not *delictis*; *prædæ*, but not *manubis*; but in these, as well as in the other instances, the plural noun is much more of a concrete and less of an abstract character than the singular, so that this second character is, as it were, an instance of, or at least an offshoot from, the first—namely, that which confines its use, or nearly confines it, to semi-abstract substantives.

The care with which Mr. Roby has investigated this point may be judged of, not only from his enumeration of the nouns and the instances in which they are found so used, but also by the separate classification he has made of them in his own mind. For instance, he notices their great rarity in Martial and the younger Pliny; also, that, out of the whole number, not much more than a fifth can be pronounced to be of frequent occurrence, and about a third only have been found as often as five times. Again, after observing that the dative is used most frequently with *esse*, he adds that, of the whole number, 117 appear to be used only with *esse*, and 11 with other verbs and not with *esse*. Of these latter, he continues, only *vigto*, *domo*, and perhaps *muneris*, are used often enough to make the non-occurrence of *esse* with them at all noticeable, though surely there is a distinction here to be made between the subjective and objective sense which mainly accounts for the rarity of usage. Nothing, in fact, that could be said on the subject seems to have escaped him, and he has here anticipated the objection that the scholar would be sure to allege, when he says (p. xxxi.) that

No doubt in all such matters we ought to bear constantly in mind what (to apply one of Darwin's phrases) I may call the imperfection of the philological record. There were a great many books written between Plautus and Tacitus which have perished altogether, and many expressions may have been common enough in the atrium and the forum, in the camp and on the farm, which have found but scanty recognition in a studied literature like the Roman. And the usage now in question, though capable of being applied to things of moment in a style elevated to the occasion, was yet mainly a usage of ordinary conversation.

It would perhaps have been worth Mr. Roby's while to add a catalogue of such words as do not occur used in this way with regard to which there is no obvious reason to be assigned why they should not be so used—e.g. *amicitiæ*, *indignationi*, *oblivioni*, *prætextui*, and others. Probably such a list would not be very long. Such a catalogue would have helped to decide the question whether the fact may be due to the imperfection of the record or the rare use of the words themselves in any relation, or whether any other reason is to be assigned for their non-appearance in this particular relation. It is not very satisfactory to be told that "there seems to have been on the one hand something which suggested abstract terms, and again an instinct which militated against an indiscriminate use of them."

We have dwelt longer on this subject than we at first intended, but perhaps it is the most interesting, as well as the most original, part of Mr. Roby's book. He sums up what he has to say as follows:—

That the usage is sufficiently distinct to demand a co-ordinate, not subordinate, rank to the indirect object appears to us the ultimate result to which we can at present attain. It may be historically a daughter, though so old as to look like a sister. Intermediate usages may be found, but such would almost inevitably exist even if the two classes have quite distinct origin. And till we know the precise meaning and history of the suffix which forms the dative case, it is impossible to be confident whether the tree had one trunk or two.

We proceed now to redeem the promise of our previous article—namely, to say a few words on Mr. Roby's treatment of the subjunctive mood. And here we find ourselves in the same difficulty that we experienced in regard to the noun-inflections. It is impossible within our ordinary limits, even after we have made the special selection of the subjunctive mood, to give any adequate idea of the new method of classification which he has adopted. And we are moreover at a loss as to which of the seven chapters devoted to this mood we shall attempt to analyse. We must, however, first give an outline of the mode of division of the meanings and usages of the subjunctive, which is not materially different from that which the author put out in his "Elementary Latin Grammar" of 1862.

After premising that the general distinction between the indicative and the subjunctive is that the one expresses an action or event done or narrated, the other as thought or supposed, he proceeds to enumerate the eight main classes, which he arranges two and two in four different categories. Under the first head come two classes of sentences, which are called respectively hypothetical (A) and conditional (B) sentences, the former name being given to the apodosis only, the latter to the protasis only, of what are commonly called conditional sentences. The ambiguity contained in this new use of the word conditional sentence is somewhat puzzling. The following typical example will explain it:—*Fecerim si jussoris* and *si jussoris fecerim*, "I should be found to have," or "I should have done if you should have bidden," are classed under the head of hypothetical, as far as the apodosis *fecerim*, "I should have done," is concerned, and again under the head of conditional on account of the protasis, *si jussoris*, "If you should have bidden." And now Mr. Roby's explanation of his novel use of words will be intelligible. He says:—

As here used, therefore, the hypothesis is the action treated as contingent on another; the condition is that other action on which the first is contingent.

Under this first head of hypothetical (A) sentences one page is given of typical examples, and a considerable part of Chapter XX. is devoted to actual examples occurring in classical authors of its use; and in the heading of this chapter we have the more correct expression "clause" used for what in the nineteenth chapter is ambiguously termed "sentence." All these instances are printed on the left hand, each paragraph being numbered with an even number, the opposite page being filled with examples illustrative of the contrasted use of the indicative mood.

The general account given by Mr. Roby of the distinction is as follows:—

In these sentences, which readily admit of either the indicative or subjunctive mood, the subjunctive implies that the action spoken of is *nota fact*. Nothing is implied as to knowledge or want of knowledge, doubt or assurance, probability or improbability, possibility or impossibility, so far as the mood is concerned; but a non-real *past* action is of course impossible, a non-real *future* action is (apart from intrinsic impossibilities) possible.

There is only one other of the eight classes in which the subjunctive mood is found in simple or principal sentences; in all others it is in subordinate sentences. This is in sentences expressing a wish or command, treated in Chapter XXI., under the head of Optative and Jussive Subjunctive. Typical instances are such as *Pace horum dixerim* and *Utinam valeas*. But we must confine our attention to the hypothetical subjunctive—i.e. the subjunctive as it appears in the principal clause of a conditional sentence. The general statements which the parallel arrangement of sentences is made to illustrate are the following, which, for the sake of perspicuity, we now exhibit in parallel columns:—

An hypothetical subjunctive expresses an action which, while its non-occurrence is implied, is yet supposed to occur, if some other action occur.	The indicative makes a statement without implying that the action does not occur or (necessarily) that it does occur.
---	---

Without attempting to follow Mr. Roby through the rules which he proceeds to lay down for the use of the different tenses of the subjunctive in both clauses, we will pick out two or three of the shortest of his illustrative sentences, and arrange them in a similar way opposite to each other:—

<i>Tu si hic sis aliter sentias.</i>	<i>Si id facis, hodie postremum me vides.</i>
<i>Quos ni mea cura resistat, jam flammæ tulerint inimicæ et hauserint enses.</i>	<i>Si enim rationem hominibus Di dederunt, malitiam dederunt.</i>
<i>Si aut collegam, id quod mallem, tui similem haberes aut tu collegæ tui eses similis, supervacanea esset oratio mea.</i>	<i>Metellum si parum pudor ipsius detendebat, debebat familiæ nostræ dignitas satis sublevare.</i>
<i>Ergo ego nisi peperissem, Roma non oppugnaretur; nisi illiun habere, libera in libera patria mortua essem.</i>	<i>Cesseram, si alienam a me plebem fuisse cultis, quæ non fuit, invidiæ; si vis suberat, armis; si periculum civium, reipublicæ.</i>

This parallel arrangement of the use of the indicative and subjunctive moods in sentences which have a considerable resemblance to each other, and where the distinction of meaning is slight, is one of the most useful parts of Mr. Roby's Grammar. It may be a question whether he has classified these minute distinctions in the best possible way, but he has unquestionably given ample facilities to any one who may object to his theory to propound another which shall suit all the circumstances of the case better. For other instances of the comparative use of the two moods we must refer to the sections 1532, 1533, from which all the above extracts have been selected; but those we have given will perhaps be sufficient to enable an ordinary scholar to follow Mr. Roby in the account which he has given of this subject in his Introduction. He says:—

The use and meaning of the subjunctive in hypothetical and conditional sentences is, I think, often misapprehended. The indicative is often said to be used only when the condition is a fact or when it is only an apparent condition. The subjunctive present is said to be used when an event is regarded as probable or possible; the imperfect, where it is regarded as improbable or impossible. I have ventured to deny these views. The matter, I take it, stands really thus. The indicative is a simple combination of subject and predicate and has of itself no special meaning. The subjunctive has been formed, or at least is applied, in order to warn the hearer that the event is *thought* and only thought. The indicative by contrast with this gets a sub-implication of fact. The subjunctive, again, by a secondary contrast gets (in certain classes of sentences) the special implication of *not fact*. Now the statements used in hypothetical and conditional clauses are refer-

able in the speaker's mind and intention (we have nothing to do with the objective reality) either to fact, or to not fact, or to a neutral head. In other words, I either put a case avowedly as a fact or avowedly as not a fact; or I put it simply without meaning to imply either the one or the other. This intermediate class is of course a thought, and might have been left to the subjunctive mood. But this is not what the Romans have done. The subjunctive with them in such sentences means distinctly *not fact*, and the class of fact and the neutral class are given to the indicative.

To do Mr. Roby's theory full justice we ought to have extracted the whole of the rest of this page. We may observe that the theory which he attacks, though imperfect, has at least the merit of being intelligible and of easy application. On the other hand, if his theory be pressed, there ought to be no use of the pluperfect indicative, which, as he observes, is the most thoroughly past tense, in hypothetical clauses. He observes that it is *rare* in hypothetical sentences, except as a wilful exaggeration, and rare in conditional clauses, except when it denotes facts. He does not appear to us to have taken into consideration, or at least not to have noticed prominently enough, the poetical use, which is not uncommon, such as—*Robustique fores manerant sales, Si non Acrisium Juppiter et Venus risissent*. We have precisely the same poetical use in English. The poetical and quasi-poetical use may, however, be regarded, as Mr. Roby seems to regard them, as something like the *exceptio quæ probat regulam*.

We have only just touched two of the eight uses of the subjunctive mood as laid down in this grammar. It would not be possible to criticize or even to notice the remaining uses without doubling the length of this already long article. Moreover, we have left unnoticed the Introduction and the Supplement to the Syntax. We regret that we must here for the present, though reluctantly, part with a book which is very suggestive of thought in other directions than those which we have indicated.

KATE BYRNE.*

"**M**EN in love," says the author of this story, "seldom moralize." It is much to be wished then, we cried out as we came to this passage, that all novel-writers, whether male or female, were always in love. We should in that case be spared a good deal of very dull writing. *Kate Byrne* is avowedly written with a moral. "We have tried to show," says the author, "how a beautiful woman failed to find any contentment or happiness in marrying for wealth and position a man whom she did not love, and with whom she had no tastes or wishes in common." Part of the demonstration, by the way, depends on the death of her only child three days or so after birth. If the child had lived the marriage might, so far as we can see, have been happy enough. The beautiful young women whom the author would keep from marrying lords who have a good chance of a dukedom might with reason rely on the statistics of infant mortality among the aristocracy, and with no great imprudence might stake their happiness on the chance of an heir. It would be just as well, however, for lords in general to think twice before they marry a mercenary heroine. Their life is likely to be a short one, and far from merry. When a heroine has to be reformed, and made to see the error of her ways, human life counts for nothing. One victim after another is swept away—even the aristocracy is not spared—till, widowed, childless, and an orphan, she becomes properly penitent in the last chapter. "We have followed her," says the author in writing of her heroine, "through a few years of fashionable slavery and dissipation, until by a merciful interposition of Providence her plans for a last struggle for some peace and independence were frustrated, and she was led back to her wifely duty." Whether Lord Denton, if he had been well enough to consider the question, would have regarded the fit which after a short illness carried him off as a merciful interposition of Providence, may be doubted. It taught Lady Denton no doubt her wifely duty, but, as he lived only a few weeks to enjoy her penitence, he may have thought that it was paying rather too dear for his whistle. He is introduced to us as a large landed proprietor, in appearance more jolly than gentlemanly, and as one able to offer all the luxuries this world can give. We might with good reason have argued that, as he was not the one chiefly to blame for the unhappiness of their married life, and as nevertheless he was quite as much in need of reformation as his wife, he deserved no less than she a merciful interposition. If the story had been written from a different point of view, it would have been the wife who was killed, while her noble husband in his penitent sorrow would never again have taken "a bumper of brandy and soda-water," but would have become President of the Teetotal Association.

The plot of the story is simple enough. Kate Byrne, "a queenly creature," as she is called, is in love with Bartle Blake, but will not marry him, because he is poor. Helen, or Ellen, Leigh—for her name varies—is also in love with him, but has no objection to poverty. Kate marries Lord Denton, as we have said, and repents. Helen marries Blake, and does not repent. Kate, however, does very well in the end, for not only does she live a highly virtuous life at Denton Court, devoted to her old aunt and her stepson the Duke, but when he married a blue-eyed gentle girl—the third blue-eyed girl of the story—and has children, she is to them "their beautiful stately grandmother Denton." We cannot but fear that if the punishment that attends on marrying for money is nothing worse than a merciful dispensation by

which the husband is carried off by a fit, while solid comfort is left in a title, "an ample allowance," and the devoted affection of a Duke, we shall have all the novel-reading young ladies of the day ready to follow in the heroine's steps. The plot is now and then enlivened by an incident or two. On one occasion the heroine sprains her ankle, and on another she has a remarkable encounter with some burglars. The burglars have nothing at all to do with the story, except so far as they give the heroine an opportunity of showing her presence of mind by seizing one of them by the hair, and her lover, Lord Denton, an opportunity of expressing his desire "to horsewhip the wretch" who had frightened Kate. She had been awakened up by a noise. She listened. "The extreme silence of the house made her feel almost nervous, and her heart beat quickly and loudly." What her heart would have done if she had been quite nervous we are not told. She thought that "if she only dared show herself in white, that might frighten them perhaps; thieves were always cowards she knew." She went out of her room, and downstairs:—

She made one or two steps forward into the hall, when, to her intense surprise, she saw distinctly a dark figure coming towards her—a man—a thief, a robber. Oh, heavens! She could not move or speak. The man carried something in his arms, and he also came to a stand-still, and did not speak. A deep sigh, which Kate made in her effort to articulate, caused the man to start and drop what he held out of his arms—it was the silver commonly in use from the pantry. The crash gave Kate courage, and, without moving a step, and putting out her hand, she said, in a deep low voice, "What are you doing here?" The man gave one bound past her, towards the dining-room door; but quick as lightning she darted forward, held him by his coat and hat, and screamed loudly, "Thief! murder! murder!" In much less time than it takes to write this, Norah and Bates had come to Kate's assistance. Bates had heard the fall of the silver, and struck a light; immediately hearing Kate's screams, he had come, just as he was, to the rescue. Then Mrs. and Miss Leigh, and Miss Castelli, with the other servants, came down, half awake and terribly frightened; and when the former fully realized the danger Kate had been in, they were quite overcome, and could scarcely believe she was not at all hurt. The coachman was sent for from the lodge, and, with Bates, guarded the prisoner till he was willingly resigned to the tender care and protection of the village constable. That worthy person seemed to regret deeply that he had not had the pleasure of catching the above-aid individual.

Let not our readers imagine that this incident is a specimen of what they may chiefly expect to find in the book. There is a good deal of bad English, but of really bad characters there is a remarkable scarcity. "How is it," the author asks, "that most elderly people (especially gentlemen) seem to have such pleasure in the constant repetition of their pet jokes and stories?" "How is it," we might in our turn ask, "that so many young people (especially ladies) have such pleasure in hashing up the same old plots and serving them up as if they were new stories?" We might go on to add, "How wonderfully good-natured their listeners need to be to show any sort of interest, or listen with patience to what is so very old and often very stupid." We, for our part, have a great deal of respect for an old man's story. That we have laughed at it any time these twenty years establishes, we admit, an obligation on us to laugh at it once more. Among the privileges to which old age is entitled, Cicero in his "Orator Major" does not indeed reckon this, which we hold to be by no means the least in importance, that its old jests should always pass current as new. Perhaps in *Cato's* time the story of old grouse in the gun-room was not known. However much we may respect the jokes and stories of the old, we see no reason for showing the least regard to the stories of the young. We are certainly entitled to ask that before they publish they should at least learn how to write. It would be well also if, before they tried to paint character, they first made it their study. As Douglas Jerrold said, before you take down the shutters you should furnish the shop. We doubt not that *Kate Byrne* will find its readers. It is no duller than a tract. It has, as we have said, a moral, and there are not a few readers who as much require a moral for their novel as they do sugar for their tea. The story is to be sure so dull that it puts the reader to sleep, but there are not a few readers who regard sleep as the final cause of reading. Those, on the contrary, who think that novels are written and sermons preached rather for our waking than our sleeping hours may possibly find something to rouse their interest in the good society in which they are kept. We, for our part, managed to keep ourselves from nodding over *Kate Byrne* by having an eye to the foolish expressions and the grammatical errors we could detect, just as we have at times kept awake through a sermon by counting the heresies into which the preacher has fallen. Bad though the errors are, it is not often that we find a sentence quite so unintelligible as the following:—

It was a kind of nursery for the invalids; and it was his coming to bring and see after a recent valuable purchase that had enabled the Clennings to invite and persuade him to accept their offer of a few days' visit during the coming-of-age festivities.

A few pages earlier we have a specimen of the confusion into which the author gets when she attempts a parenthesis. It would be just as well, by the way, if at young ladies' schools they taught, with the use of the globes, the use also of brackets. Our novelists would in this case have more chance of avoiding such errors as those contained in the following sentence:—

The truth was, that he had been so taken up with Mrs. Leigh and Helen when he first came in (which, considering the time that had elapsed since he had seen the former, was hardly to be wondered at), and having seen Kate at the Hall only an hour or two before, he had scarcely noticed her, beyond bowing to her as he entered.

To make up for such slips as this the author can, when she pleases, get some very fine words out of very common-

* *Kate Byrne*. A Novel. By S. Howard-Taylor. 2 vols. London: Samuel Tinsley. 1874.

place matters. The arrival of a heroine is certainly a matter of some importance, but unless she can be brought in a balloon or on an elephant, the vehicle in which she comes may as well be kept in the background. Not so thinks our author. "Mrs. Leigh and Helen were on the platform, waiting the arrival of the 'iron horse' which was to bring their expected guest. The huge machinery had scarcely come to a stand-still before Kate was in Helen's arms." Happily there she is left, and so no big names are found for the porter and his barrow. Kate, before she had decided not to accept Bartle Blake, had leant upon "her fair jewelled hand," and indulged in "cogitations." Her father had "a gloomy kind of presentiment" about the course she was going to take. Whereupon, as we knew would be the case, the author asks, "Who can say that we do not all sometimes have shadowy glimpses of coming trouble?" We have often noticed that when a writer introduces any piece of superstitious nonsense into his book he at once follows it up by asking a question. It turns the tables, as it were, on the rash sceptic who, he knows, is ready to laugh at him. The heroine has a dreadful dream, and was, as she described herself, "in a perfect state of fear and suffering." When she first comes to Denton Court "the old-fashioned furniture was to be replaced by modern elegant additions or substitutes." Allowing that a substitute can be said to replace, we are somewhat puzzled about the addition. At her marriage there were in the church "exclamations of delight and satisfaction at the elegant appearance of the whole party." Her husband condescends, as so great a nobleman should, to the use of more familiar language, for he addresses her as "my peerless Kitty." A lady in the story "tried to pour heaps of contrite excuses in Lady Denton's ear," while Helen, the rival heroine, seeing Bartle Blake at the opera, asks "Isn't it him?" The young Duke had a great regard for his tutor's wife, "who (sic) he wrote to every week." The day Lord Denton was seized with the fit his wife "several times fancied she could hear him saying, 'Good-bye, Kate; don't wait dinner for me,' to which she replied with a bend of her head, as she thought it something what he used to do before they drifted so far apart."

There is only one sensible thing said in the whole book. We have no reason to believe, however, that the author intended to be sensible. Helen, the good heroine, after she had said she should wish Blake to marry some one very nice, added—"I can't very well explain the meaning I have for that pet word of mine." A schoolboy might as well try to give a definition of "jolly" as a young lady of "nice." In Ceylon they reckon up the hundred uses, as different as can be, to which the palm-tree can be put. Even the palm-tree falls far short of this little English word. We are not sure, indeed, if after all we might not, with a safe conscience, describe *Kate Byrne* as a very nice book.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

PARIS.

PROVINCE of ONTARIO (CANADA).—CANADA

MUNICIPAL BONDS. FOR SALE. Debentures of Counties, Towns, and other Municipalities in the Province of Ontario, Dominion of Canada, at prices yielding between six and seven per Cent. Interest, and payable in sterling in London.

The Colonial Trusts Corporation (Limited), as Agents for the Province of Ontario, under whose authority these Municipal Debentures are issued, offer them to investors on the terms and for the respective Municipalities as stated below.

These Debts, which have all been incurred in aid of Railways and other public works, constitute in each case a first mortgage charge on the respective municipal revenues and accessible property. These revenues are ample in every case, and to the extent required by the obligations are administered for the Debenture-holders by the Province, which also guarantees the Holder's title.

The Debentures fall due over a term from December 31, 1880, to August 31, 1893. The prices range from £20 10s. for those of 1880, to £21 for the longest term, 1893. (Of the total of £364,400, those falling due in 1893 amount to £249,400. The Interest is due half-yearly, on June 30 and December 31.)

The Terms of Purchase are Ten per Cent. on application, and the balance on allotment and delivery of the Bonds.

The prices are net, ex accrued Interest, which purchasers have to pay up from June 30 last.

All further particulars will be given on application at the Offices of the Agents, **COLONIAL TRUSTS CORPORATION, LIMITED,** 31 Palmerston Buildings, Old Broad Street, London.

Deposits and other Payments are to be made to their Bankers, Messrs. GLEN, MILLER, CLARKE & CO., Lombard Street.

THE PEACE OF EUROPE.

IN his speech at the opening of the German Parliament last week the Emperor WILLIAM took occasion to refer to the constant attacks made on Germany by the French press, and he stated that his Government would take no notice of these attacks until it saw that the French hostility threatened to assume a more active form than that of abusive articles. That the EMPEROR should have thought it worth while to dwell on the abuse of French newspapers struck his subjects with surprise, and set them wondering as to what secret of State could be hidden under his words. They seem to have come to the conclusion that their good and watchful Sovereign was merely giving them a kindly piece of warning. Before the war of 1870, they remember, the French press was very abusive; but, with the unsuspecting gentleness which distinguishes them, they treated its outbreaks as meaning nothing, and then were rudely undeceived by finding out that the violent language of the French press had been deliberately used in order to prepare the way for real fighting. Under the guidance of their EMPEROR they are not to be caught napping a second time, and are now alive to the artifices and manœuvres of their enemies. Perhaps the German Government may not be sorry to see the nation awake to the possibility of another war at the moment when it is making new demands of a very serious kind for the increase of the army and of the expenses which the army entails. But the general tone of the EMPEROR'S speech was eminently pacific; and for the present military purposes of his Government it is even more necessary that there should be a general conviction that resort will only be had to war when peace is absolutely impossible than that the nation should be frightened into sanctioning an increase of military strength. The embodiment of the Landsturm is a measure which may probably add very considerably to the fighting power of Germany; but it makes persons who have everything to lose by war, and who are above all others least inclined to fight for trifles, personal participators in the dangers and sufferings of a campaign. The huge armaments of Europe are a frightful waste of money, and are in themselves a source of danger. *Si vis pacem, para bellum* is an excellent maxim when it is addressed to any one threatened State. But if all States provide for peace by preparing for war, they may easily defeat their wise purpose. And yet the very hugeness of modern armaments has some advantages. The armies of Europe are most valuable instruments in aiding the process of binding nations together. They contribute materially to doing away with provincial jealousies and the antagonism of classes. Prince BISMARCK was talking very good sense when he said that the fusion of conscripts from Alsace and Lorraine in the German army would tend to make the inhabitants of those districts realize the fact that they are now Germans, just as their affection for France had been largely stimulated by their having shared in the glories and trials of France during the wars of the Revolution and of NAPOLEON. If Italy is half ruined by her army, she is indebted to it more than to anything else for the diffusion of a real sense of union through the population; and even in our humble way we may speak of our Volunteers as having done something to give Englishmen of different ranks a common purpose and common interests. These big armies are, too, from their composition a guarantee for peace. The whole nation becomes deeply interested in the policy of its rulers. Middle-aged men who hate marching about, and have no anxiety to kill or be killed, are not nearly so

likely to view with satisfaction schemes of military aggrandizement as a young professional army longing for adventure and distinction. We may be sure that no Germans received with greater pleasure the assurances of the EMPEROR that he was on the best of terms with Austria and Russia, and was indifferent to the insults of French journalists, than the venerable persons who will be affected by the proposed measure for embodying the Landsturm.

We hear so often of the feverish state of the Continent and of the many causes that might give rise to war, that it is as well to look sometimes on the other side of the picture and notice the many influences which tend to preserve peace. To shut our eyes and lull ourselves with false hopes of security would no doubt be absurd, and when we remember that only a few months ago so reserved a person as Lord DERBY sounded a note of alarm, we must be ready to admit that events may easily show that all calculations of continued peace have been wrong. All we can say is that the motives which would prompt the great Powers to abstain from war are now numerous and powerful. Every great Continental nation has now got its own peculiar domestic difficulties, and they are difficulties of a kind so marked and obvious that there is no need to particularize them. In old days, too, there was always the feeling that even war might be found cheaper and more agreeable than a state of costly and precarious peace. But the hope that a few months of war might enable a nation to return to reduced outlay and contracted armaments is now dispelled. If France and Germany had another war, the vanquished country would only go in for new and larger armies, more guns, and bigger fortresses. But it must be owned that internal embarrassments often lead to war instead of preventing it; for men may say that, if they are doomed to be for ever taxed in purse and person for military purposes, they may as well get occasionally out of a bad state of things such gratification as war can give. It is not so much because they are oppressed by internal embarrassments, or because they groan under military burdens, that the nations of the Continent and their Governments may be supposed to be averse to war, as because they are all actively engaged in trying to accomplish aims with which war would interfere. A nation which is on the verge of bankruptcy, and feels further effort to be useless, is more inclined to go to war than not. To inform creditors in a time of peace that the national engagements cannot be met seems shabby; but insolvency appears natural, and even respectable, in the blaze of a campaign. When, however, nations like Austria and Italy are not quite able to pay their way, but can very nearly do so, and are honestly making every effort to maintain their financial credit, the reluctance to spoil everything by a war is so great that it needs a very strong inducement to overcome it. Germany is not solely engaged in arming itself to the teeth and putting priests and diplomats in prison; it is occupying itself with great measures for the consolidation of the Empire, with the construction of a Code, with the introduction of a new coinage, and with the organization of a Government for Alsace and Lorraine. Russia has got a hundred different tasks on her hands which she is pursuing with unremitting activity; and Frenchmen, though they quarrel about the Septennate, and like reading a good spicy article showing how many French clocks WILLIAM has collected at Potsdam, are really engrossed with one thought, and that is, how to make enough money to be as comfortably off under their new budgets as they were before the war. None of these objects are in themselves absorbing enough to avert a war if a

cause of war; arose but in private life we know that nothing keeps people from quarrelling so much as their having plenty of occupation, and what is true of families is perhaps not less true of nations.

There are, indeed, permanent sources of danger to the peace of Europe which must not be left out of sight. The chief of these are Ultramontanism, Socialism, and the Ottoman Empire. That the Ultramontane party would dearly love to get up a war of opinion and have recourse to the arm of the flesh is more than probable. But Europe is, on the whole, presenting a firm front to Ultramontanism, and Ultramontanism is a foe which to face is to conquer. Prince BISMARCK has his own fierce way of fighting the battle, and the very existence of Italy depends on the national resolution not to yield an inch of the ground that has been won. But if there were a current of feeling among the neighbours of Germany and Italy adverse to that which prevails in those countries, war might be only made more probable by the decisive line which Germany and Italy adopt. Fortunately, this is not so. France has been gradually disengaging her foreign policy from the ecclesiastical influences which shortly after the war were so powerful; and in Austria, though there is nothing like a rupture with the Church, the secular spirit prevails every day more clearly. In Ireland the priests seem now disposed to throw themselves more unreservedly than heretofore into the Home Rule movement, but the only effect of this will be to strengthen the conviction that if England and Ireland were half separated, there would at once arise a deadly quarrel on questions of foreign policy which would lead to a total separation or a new conquest. How dangerous Socialism is no one can pretend to know; but at Paris and Carthage Socialists have at least had checks too severe to permit them to think very soon of having again recourse to open violence. And, what is much more important, there is a growing willingness in England—and in this matter England will serve to a great extent as the instructress of Europe—to talk their whole case out with the Socialists, to hear what they have got to say, to go into facts and figures, and to appeal to the arbitrament of common sense. Feeling, too, goes a long way in the world; and there is throughout Europe, and especially in England, a much more kindly and gentle patience with the inevitable errors of silly, uneducated, dreamy men than used to prevail. The rich man is not now so much inclined as he once was to keep aloof from the dissatisfied poor man as a bloodthirsty ruffian, but is disposed to offer to shake hands with him and to talk the matter quietly out in fair discussion; and this is the best, because the most abiding, antidote to Socialism that can possibly be; for the instruction gained will not be, we may be sure, all on one side. Turkey is perhaps, of the three sources of danger to European peace, the most serious. There it always is, in the corner of our system, a thing we can neither do with nor without, a convenient sham, an evil without any apparent remedy. The recent history of Turkey is very simple. It has incurred an enormous public debt, and has squandered the money on totally useless objects. The provinces are drained in order that millions may be heaped into the lap of Constantinople. If the creditors are now to be paid for the first time from revenue, and not by new loans, there will be no money to carry on the enormously expensive machinery by which the present system of government is kept going. If Turkey does not pay her creditors, they will clamour for some solvent Power to assume her burdens. The day that Turkey ceases to live on borrowed money can scarcely fail to bring with it the certainty of the old familiar Eastern question being revived; and this time it will have to be settled, although, if the great Powers are wise and forbearing towards each other, it may possibly be settled without bloodshed.

THE CHAMBER OF AGRICULTURE.

THE Central Chamber of Agriculture at its recent meeting discussed more than one subject of importance, and its deliberations may possibly lead to some practical result. The members of the Chamber are happily unanimous on one point, for they all deprecate the imposition of new charges on the rates. The contribution made on the proposal of the Government to the cost of the police and of lunatics is acknowledged with a gratitude which is partially prospective. The Chamber hopes that in a future

Session further relief may be afforded to ratepayers, and the suggestion that some branch of Imperial revenue should be appropriated to local purposes is generally approved. Although the late Government at one time proposed to hand over the House-duty to the local authorities, it may be hoped that a sounder policy will be preferred by the Legislature. Imperial taxation always admits of readjustment to remove or diminish inequalities. When economists from time to time elucidate the theory of taxation and expose existing errors, their conclusions are ultimately adopted by practical financiers; but a House-tax payable to the funds of Unions or of counties would be almost necessarily perpetual. The question of its fairness and expediency would be virtually withdrawn from the cognizance of Parliament, while local communities would acquire a vested interest in a source of revenue which might be intrinsically objectionable. The duty and power of assessing the tax are far less invidiously intrusted to the officers of the Government than to local Committees, which are necessarily composed of interested persons. If it is deemed right that the ratepayers should receive additional relief from the Treasury, a money payment is a far more convenient arrangement than the transfer of a tax. It is possible that at any time Parliament might have good reasons for increasing or diminishing the amount of the House-duty, or for extending the area of taxation which has been arbitrarily narrowed. Great difficulties would be thrown in the way of any operation of the kind if the duty had become a portion of the rates. The State could scarcely, even in a case of emergency, levy a second House-tax for its own purposes.

The present Government, whatever may be the merit of its policy of concession to the ratepayers, was well advised in making its contributions applicable to special objects. It might be plausibly contended that, since the whole community is interested in the efficiency of the police and in the proper treatment of lunatics, it was unjust to impose the entire cost on the owners of certain kinds of property. When Parliament makes a grant from the public revenue in aid of any branch of local administration, the Government on behalf of the country at large acquires a corresponding right to control the expenditure of which it provides a part. It would be greatly for the public advantage that the county and borough police should be more systematically organized. At present no constable can act, except within a very narrow range, outside the boundaries of his own district; and it sometimes happens that the frontier of two independent jurisdictions is preferred by the predatory classes as a convenient field for their operations. It may happen that the boundary of two counties is formed for many miles by a river, or perhaps by an imaginary line, and that one side of the border may be properly watched and guarded, while the other is remote from a police-station. Between borough and county police there is sometimes a jealousy prejudicial to the public service, and the members of both forces have an interest in throwing upon their neighbours the responsibility for any failure in the protection of property or order. The cost of maintaining the whole police of the kingdom would be not more than an adequate price for the transfer to the Government of the entire management of the force. Every constable ought to have power to act in any part of the country, and the administration ought to be central and systematic. Even the independent organization of the City police is in some degree detrimental to the efficiency of the force in London.

As usual, the Central Chamber professed a desire for the institution of a Ministry of Agriculture and Commerce. The proposal which was made last Session that the President of the Council should be called Minister of Education was, on the whole, supported by some plausible arguments. There is already a Board of Trade with extremely little for its President to do, although the permanent staff of the office is entrusted with many functions of detail. If agriculture wants any official interference, nothing would be easier than to add one or more chief clerks, with the proper number of assistants, to the existing body; and if the farmers would be pleased with a titular recognition of the importance of their industry, the Board might be designated the Board of Trade and Agriculture. One of the Committees of the Council of the Chamber employed itself in enumerating the duties which might be assigned to a Minister of Agriculture. He would naturally attend to the Acts relating to the diseases of live stock; he would exercise some undefined super-

vision over the arterial drainage of fen districts; and he would see that statistics and corn returns were duly recorded and published. It may be assumed that, if any additional excuse could be devised for the proposed innovation, the Committee would not have failed to discover employment for their Minister. All these duties are at present discharged by existing functionaries; and if the distribution of official labour admits of rearrangement, the Chamber suggests nothing which would require the intervention of a new Cabinet Minister. If the duties of the President of the Board of Trade were multiplied threefold, he would still enjoy much greater leisure than the Home Secretary. A Minister of Justice or a Minister of Education would hold an office which might not be so completely a sinecure as a Department of Agriculture. When the representatives of any interest wish to magnify its importance, they almost always in modern times propose the creation of a new Ministerial office. Experience shows that a multiplication of departments is not conducive to efficient administration.

The only serious discussion related to the important subject of roads. It was ultimately resolved that reorganization of the road system is urgently required, that roads should be divided into first class and second class, the first class consisting of present and former turnpike roads, and of such roads as might be considered main thoroughfares. The Chamber recommended that the first-class roads should be maintained by district rates aided by Imperial taxation, and the second-class roads exclusively by rates. It was also held that the establishment of Highway Boards should be made compulsory. The rapid extinction of turnpike trusts gives urgency to the question of maintaining the great thoroughfares. In some districts, and even in parts of the metropolitan counties, roads which had long been models of excellence are beginning, in consequence of the abolition of turnpike tolls, to be seamed with ruts and to be heavy with mire. It is not impossible that some main roads may gradually relapse into the condition which is described in records of the eighteenth century. At that time horsemen had generally the option of finding their way through the open country. All travellers are now confined to the highway, and all alike suffer by its deterioration. Until Highway Boards are made compulsory and universal, there is little hope of improvement. The ratepayers of a parish not unreasonably think it unjust that they should maintain the means of communication between distant towns, while they have themselves little more interest in the road than their neighbours who are exempt from taxation. The Chamber of Agriculture seemed not to be sanguine in the hope that they would receive a contribution from the Government; but it is an anomaly that towns connected by a road should pay nothing towards its maintenance. The system of turnpike tolls was liable to theoretical objections, but it resulted in the existence of good roads. It is now almost impossible to effect an improvement such as easing the gradient of a hill or even cutting off a corner. The ratepayers will have nothing to say to schemes which involve an expenditure of capital; and their standard of excellence is much lower than that of turnpike trusts. In preparing the way for legislation on matters of this kind the Chamber of Commerce discharges a more useful function than in demanding new Cabinet Ministers.

MR. GRANT DUFF AND CASSANDRA.

ON the eve of his departure for India, where he will make fresh additions to his accumulated hoards of knowledge, Mr. GRANT DUFF has published both orally and in the pages of the *Fortnightly Review* an elaborate reply to the forebodings of Mr. GREG's "CASSANDRA." The most plausible and most ingenious part of his apology for the England of the future is a catalogue of the dangers which might be enumerated by a Russian CASSANDRA as impending over that great and growing Empire. A corrupt and superstitious Church, a disaffected multitude of Dissenters, a false traditional policy, and an unwieldy territory, may probably cause a thoughtful Russian patriot well-founded anxiety. Many causes may impede the advance of Russia, or even finally interrupt her extraordinary progress in civilization. Mr. GRANT DUFF is far from anticipating that the evils which he apprehends as possible will not by fortune or wisdom be averted in practice. His object is

only to show that England, like the banished Duke in Arden, is not alone unhappy or alone insecure. It may be answered that, if Mr. GREG's fears are well founded, the simultaneous decay of Russia or of any other country would afford little consolation to Englishmen. A community of far more elevated civilization has further to fall. The manufacturing industry of Russia might disappear without seriously affecting the prosperity of the nation; and the level of communistic democracy which Mr. GREG foresees with distaste and dismay is already established among the Russian peasantry. As Mr. GRANT DUFF acutely remarks, the Eastern Church has no influence on the upper classes; or rather no literary evidence is to be found of the effect which the Russian creed produces on characters favourably disposed to its teachings. The overthrow of religious associations in England would produce results incalculable in their nature and of enormous magnitude. It would for various reasons be inconvenient to discuss Mr. GRANT DUFF's reply to Mr. GREG's anticipation of religious changes. Anxious orthodoxy is not altogether reassured by the vague intimation that a fuller knowledge of the great religions of the East will hereafter considerably modify the religious thought of the best minds in Europe. If the future prevalence of Christianity depends on a judicious infusion of Buddhism, the present condition of popular faith cannot be considered satisfactory.

Exaggerated apprehensions of political and social deterioration may to some extent, as Mr. GRANT DUFF remarks, be allayed by the recollection of former misgivings which have not been realized. At no other time was England so rich as at present, or more exempt from domestic strife and foreign hostility. The student of the histories and memoirs of the days of GEORGE III. often wonders at the equanimity with which statesmen and private Englishmen heard almost at the same moment of a rebellion in Ireland, an expected French invasion, the suspension of cash payments, and the mutiny at the North. Any one of those disasters would now appal a community which is more sensitive, perhaps because it is more intelligent. Eighty years ago no one doubted that things would somehow right themselves, and that the institutions and customs of the country were almost as closely connected with the laws of nature as the succession of summer and winter. If there were then any CASSANDRAS, their predictions have been falsified by the event, and long since forgotten. When the agitation caused by the first Reform Bill was at its height, and when a thousand schemes of change were projected in consequence of its adoption, intelligent and timid politicians foreboded, like Mr. GREG, the immediate and ruinous advance of democracy. The Duke of WELLINGTON's question how the King's Government was to be carried on also occurred to Lord MELBOURNE even before the Reform Bill had passed into a law. At that time manufacturing industry had attained dimensions which seemed considerable, although they have long since been greatly exceeded. The best economists perhaps scarcely apprehended the truth that a mass of vicious commercial legislation was equivalent to an unused treasure; and the enormous expansion of railways, with its effects on industry, had not been foreseen. The political literature of that period is for the most part gloomy and desponding, nor is it certain that fears which were not immediately justified by the result were altogether unreasonable. There is no prohibitive system the relaxation of which can serve Mr. GREG's readers as a parachute, and it is idle to hope for such another novelty as the introduction of railways.

Little comfort is to be found in the reflection that, as England was a great country before steam-engines were invented, some kind of greatness may also survive the transfer of manufacturing prosperity to more favoured regions. The greatness of a population of eight millions would not fit a community five times as numerous. It is true, as Mr. GRANT DUFF says, that hereafter emigration to America or Australia may seem as easy as a removal from Kent to the Shires; but Mr. GREG confined his prophecies to Great Britain, or to the United Kingdom; and few Englishmen would appreciate a compensation for the decline of England which would consist in the aggrandizement of the United States, or of colonies which might probably by that time have declared their independence. Domestic patriotism may perhaps not be morally the highest form of political feeling, but it is strong enough to account for the melancholy apprehension of gloomy prophets. CASSANDRA, when she lamented the approaching destruction of Troy, was perfectly indifferent to the

possible increase of the prosperity of Mycenæ. It would be as reasonable to ask a hard-working parochial incumbent to sympathize with Mr. GRANT DUFF's interest in the future progress of Mahometanism, Brahminism, or Buddhism, as to answer Mr. GREG with sanguine anticipations of increased facilities for emigration. In a poem of VICTOR HUGO's, which has for its subject the legendary history of mankind both in the past and in the future, the human race finally abandons the earth for the sky, which it ascends in an innumerable flotilla of balloons. A terrestrial philanthropist might fairly confess that his sympathies with his fellow-creatures ended when they thought fit to desert their mother Earth. Australia possesses a certain interest as a colony, but as a home it would be a poor substitute for England. The optimist and pessimist in this, as in other matters, contend with unequal weapons. The hope that things may turn out for the best, and the fear that evil may come, are not inconsistent. Mr. GREG points to definite risks, while Mr. GRANT DUFF can only say that by some unforeseen good luck they may possibly be averted. When he adds that the English pitcher has often gone to the well before, the proverbial answer is obvious. To an opponent very unlike Mr. GRANT DUFF Mr. GREG has given a forcible and impressive answer in the current number of the *Contemporary Review*. To an uncompromising democrat of the school to which Mr. ARTHUR ARNOLD belongs the impending tyranny of the multitude is of course not unwelcome. It was for the greatness and civilization of England, and not for the gratification of the mob, that Mr. GREG expressed anxiety.

The most inevitable, if not the gravest, danger which disturbs Mr. GREG is the future exhaustion of coal. There is little satisfaction to be derived from Mr. GRANT DUFF's cheerful belief that the coal deposits will still last for many years. The extraordinary dearth of two years ago has already been followed by a considerable decline in price, and it is possible that by stimulating mining enterprise the former scarcity may for a time produce unusual plenty. Hardly any of the coal which will have been won in consequence of the great demand of 1872 has yet reached the market, and probably the competition among producers will be at its highest point two or three years hence. It is evident that cheapness which is the direct result of high prices can neither be great nor permanent. The stream depends wholly on a reservoir of limited extent, with no compensating supply. Trade Unions and strikes may perhaps have done their worst, and in any case their possibilities of mischief are limited in extent and probably in duration. Economical errors held by those who are the first to suffer from their results will ultimately be exploded. If it is true that the conscientious accuracy of work which once prevailed in England has been impaired, the cause of the change is that it has been found possible to earn high wages on easier terms than formerly. If it appears that employment can only be retained at the cost of additional effort, industry will once more become, as before, sufficiently minute and scrupulous to secure its reward. No moral or economical influence will affect the quantity of coal; but perhaps Mr. GRANT DUFF's satisfaction with things as they are is as useful as Mr. GREG's despondency, and it is certainly more agreeable. Let England eat and drink if to-morrow it dies. Posterity, or perhaps the generation which is now young, will no longer discuss Mr. GREG's predictions when they are verified by experience. It is to be hoped that their increased familiarity with the doctrines of BUDDHA will reconcile them, like the earlier professors of that venerable faith, to the prospect of a national Nirvāna.

WHERE IS THE ARMY?

IT is to be hoped that the present Government, however Liberal in other things, will be sufficiently Conservative to make some serious effort to maintain the army. Lord PALMERSTON, who held that this is a great country and ought to behave as such, was the sort of Conservative that is sadly wanting now. He had learned by official experience what war is, and he had a proper sense of national honour; and it is impossible to believe that he would have allowed the army to reach the inefficient and discreditable state in which one political party has placed it and the other seems content to leave it. Veteran officers, when they venture to speak, agree in condemnation. Lord SANDHURST told the House of Lords last Session that the question of the

supply of men for the army must cause apprehension, if not alarm, to every person acquainted with the facts. The Duke of CAMBRIDGE in the same debate admitted that the recruits were not what could be wished, and that the men of the Army Reserve ought to be trained much more regularly than they are. Just at the same time, Colonel STEUART published his *Reminiscences*, in which he tells us that a Highland regiment, which he had known as a most magnificent corps, now appears "all kilts and bonnets." He asks whether any one will pretend that in physical appearance the soldiers of to-day are equal to what they were twenty years ago. "The truth is, the men are not to be got." This deplorable weakness, and the blind folly which refuses to see and confess it, are the more wonderful by contrast to our neighbours. The French have had their lesson, and are profiting by it; at least to this extent, that they are organizing an army numerically strong. The Germans, earnest and thorough in all they do, present the furthest contrast to ourselves. They are a nation armed from top to toe, and full of pride from their late conquests. A competent observer of our military state and theirs would say that our best hope is that we may never come in contact with them.

All that meets the public eye bears out these professional opinions. The *Times* feebly endeavours to make things pleasant by representing that the evil is neither so great nor so incurable as is generally supposed. Within a week it has published an essay upon the advantages of a soldier's life which, unfortunately, is not likely to be read by the class from which soldiers come. But the smooth things thus spoken are believed by nobody but the speakers, and perhaps not even by them. The columns of the *Times* itself are full of complaints of desertion and re-enlistment for which no adequate remedy can be found. If the War Office told the truth, it must say that it can only get boys as recruits, and these it cannot keep. It seems to have become a regular branch of thieves' business to enlist and desert for the money to be made by selling a soldier's kit. Formerly we used to force thieves into the army; now they enter it voluntarily, but do not stay in it. They enlist, desert, and enlist again, and so on. If the trick is played once too often, the rogue is brought to a court-martial and sent to prison, when it probably appears that his delicate frame cannot support hard labour, and it is thereupon suggested that perhaps it is not worth while to detain a man who can never be a useful soldier. The discipline of the army has been mitigated for the encouragement of honest men, and the result is that thieves have taken a fancy to it. Formerly, when high bounties were paid, there was temptation to desert and re-enlist, but it was counteracted by the certainty of severe corporal punishment on detection. Now a man who has committed this offence half-a-dozen times is at last brought to a court-martial and sentenced to five years' penal servitude, and then the question is raised concerning him, "Is it worth while to retain in the army men who pass much of their term of service in prison and who cannot be of much use as soldiers when out of prison?" It is said that recruiting officers ought to avoid enlisting deserters, to which these officers answer that, if they were to begin asking questions, they might not get any recruits at all. It is of course theoretically desirable that only men of good character should enter the army, and that they should regard expulsion as a punishment; but practically such an army would be grievously costly, because all employers of labour would bid against the QUEEN for these high-principled soldiers. Even without fixing the moral standard quite so high, it is to be feared that the cost of an efficient regular army will prove so great that we shall be driven at last to face the unpleasant question of conscription.

The *Times* and some of its correspondents would evade this question if they can, but perhaps they cannot. Lord CARDWELL's plan, which was to have set things right, is now said to have failed, and we are to try Mr. HARDY's plan, if he has one, and, if not, perhaps somebody else has. All this looks too like the "financial expedients" by which it is sometimes sought to avert inevitable bankruptcy. When we have tried all the plans and they have all failed, we shall, if we do not sustain a great disaster in the meantime, arrive at the conclusion that we cannot pay in purse, and therefore must pay in person. Mr. JOHN HOLMES, an opponent of Lord CARDWELL's plan, declares that, if the British army is not to be permitted to dwindle down to a mere figment of the

imagination of its administrators, another plan which he describes must be adopted. But if this plan should fail, which we think highly probable, the dwindling process must apparently proceed until it reaches the vanishing point. Mr. HOLMS compares Lord CARDWELL's plan to the celebrated attempt to feed a horse on nothing a day. "The nation may reckon itself lucky if, after a full term of the reorganization scheme, anything of our army survives." Mr. HOLMS proposes a system of separate enlistment for Indian and Colonial service, which, even if in itself advisable, cannot supply the pressing want of an army for Europe. We say for Europe, because the question cannot be viewed simply as one of home defence. Circumstances might compel us to send a force to the Continent, and if we attempted to maintain for six months anything deserving to be called an army out of England, we should have no army left in England. If this is a just estimate of future possibilities, it is surely very alarming. It may indeed be said that we cannot be compelled to send troops abroad, and should abstain from doing so, allowing, if need be, treaties to be violated which we have pledged our honour to maintain. To those who argue thus we can only answer by referring to Lord PALMERSTON's warning as to the danger of habitual concessions. Mr. HOLMS is probably not anxious to provide facilities for foreign expeditions, but he appears sensible of the necessity of a real army for home defence, and if his own plan cannot produce such an army he is bound to insist that by some means it shall be produced. Mr. HOLMS regards the question of recruiting simply as a question of the employment of labour, and upon such a question he claims to speak from experience. He thinks that the workman, that is, the proposed recruit, requires a clear understanding of his bargain, and an opportunity of revising it within a reasonable time. The first requirement need not cause difficulty, for when we have settled what our plan is, we ought to be able to describe it in simple language. The second requirement would be met by Mr. HOLMS by enlisting the recruit for a short period and then passing him into the Reserve, which he proposes to make an efficient force. We shall perhaps do no great injustice by describing this as a plan for sacrificing the Army to the Reserve, and it appears to be possible that we might lose the former and not gain the latter. Mr. HOLMS does not tell us for how many years the soldier is to continue in the Reserve, but we presume that, whatever be the period, he is not to be permitted to "revise his bargain" while it lasts. The essence of this proposal seems to be contained in the words—"If our men were passed more rapidly through the ranks of the Line, and drafted into a Reserve force, we could well afford to stimulate recruiting by increasing the pay." It is impossible to judge of the proposal without knowing how many men Mr. HOLMS would consider necessary for this Reserve force; and that may depend upon his views of what our foreign policy ought to be. Substantially, however, he proposes a standing army for Indian and Colonial service, and a Militia for home defence. This is what his plan comes to, for his so-called Home army would be merely an instruction corps for the Militia.

It is to be hoped that other employers of labour, besides Mr. HOLMS, will turn their attention to this question. He at least perceives that, if some such plan as he proposes is not effectual, we must come to a conscription. One thing at any rate is certain, that we have the men in the country if we could only contrive to make soldiers of them. This, says Mr. HOLMS, is not a party question, and he thinks that the nation may expect a speedy and satisfactory solution of the difficulty from the present MINISTER of WAR. If Mr. HARDY is capable of feeling and dealing with this emergency, he will earn for himself the praise of being the most truly Conservative statesman of his time. The traditions of his party impose on him the duty of maintaining the national honour by imposing on us, if need be, the same burden which our fathers bore. If we had time to feel our danger, we should no doubt prepare for it as they did. But in our day the blow will come suddenly if it comes at all. Whether we choose to adopt the old name and system of the Militia, or some new plan, matters little so long as we resolve that we will at once lay the foundation of a numerous and well-disciplined defensive force. Surely every person who has travelled in Germany this summer must feel ashamed of any comparison between the thoroughness of its defensive organization and the unreality of our own. We may deceive our-

selves, but we cannot deceive our neighbours. The two most popular and patriotic statesmen of their time were the Duke of WELLINGTON and Lord PALMERSTON; and if they were alive now, it is certain that they would combine in urging us to cherish no illusions, and prepare for all contingencies. It is chiefly due to them that our ports and arsenals are defensible, but a fortress is useless without soldiers. There can be no national life worth living without honour; and honour, as the world goes, can only be kept by readiness to fight for it. Until the millennium begins, *Nemo me impune lacessit* is the best principle a nation can adopt. This was the Palmerstonian principle, and we take it to be orthodox Conservatism.

THE BONAPARTISTS AND THE DUKE OF BROGLIE.

THE second ballot between M. BRASME and M. DELLISSE-ENGRAND was marked by one unexpected feature. That M. DELLISSE-ENGRAND would be elected no one had doubted. When three candidates have been reduced to two, the supporters of the candidate who has retired are not likely to abstain from voting. If they equally dislike both the remaining candidates, they may as well protest against both to the last, and not withdraw their man. The fact that they leave the field free for the other two is an indication that it is not quite a matter of indifference to them whether one succeeds or the other. Assuming that the Legitimists intended to vote either for M. BRASME or for M. DELLISSE-ENGRAND, there was not much question which would be the favoured candidate. Here and there a Legitimist leader may be found who hates the Empire even more than he hates the Republic, and thinks, truly enough, that there may be more of a career open to him under a Conservative President than under a Democratic Emperor. But the rank and file of the party are not much troubled about their careers. With them the Legitimist party is one of the three forms into which Conservatism in France is divided, and though they naturally like their own form best, they would rather see the Imperialists or the Orlanists successful than see the aggregate Conservatism of the department defeated by the Republicans. It was to be expected therefore that the votes given for M. DELLISSE-ENGRAND on Sunday last would be increased by an addition nearly equal to the votes given at the first ballot for M. JONGLEZ DE LIÈGE, and this was exactly what happened. In the first ballot M. DELLISSE-ENGRAND had 66,800 votes, in the second he had 84,460. What did not seem equally probable was that M. BRASME, though remaining second on the poll, would still have more votes in the second ballot than in the first. Yet this also happened. The votes given for him rose from 61,600 to 74,100, an increase of 12,500 votes. It seems to follow from this that there is a reserve of Republican strength in the department which, though it does not care enough for politics to vote for the Republican candidate in the first instance, can be brought out by the conviction that the contest really lies between the Republic and the Empire. The existence of such a reserve, even in a department in which Bonapartist feeling is especially strong, may prove a fact of great importance in future elections. That the Republic and the Empire are really the only parties in the field becomes clearer every day, and if there are many electors prepared to come forward at the last moment on the Republican side, it will prove a valuable counterpoise to the tendency of all the anti-Republican parties to unite when the pinch comes in support of the one which has the best chance of winning.

In all the three elections which are to be held to-morrow week, candidates of various shades of Bonapartism have come forward. In one case it was thought that a supporter of the Septennate pure and simple had at last been discovered, but his opponents have brought forward a letter, written by him in 1870, in which he congratulates NAPOLEON III. on having declared war against Prussia. After this it is difficult to resist the conclusion that M. FIEVET was no more an enemy of the Empire than others who lived and made money under its shadow. It is certainly an awkward fact to come out at election time, because if there is one part of NAPOLEON III.'s career which a politician wishing to be accounted capable would desire not to have singled out for congratulation, it is the war of 1870. Considering how soon the news of the French reverses began to arrive, M. FIEVET must put up with the reputation of being over-hasty. He should have kept his loyal

enthusiasm within bounds until he had at least one undoubted victory to serve as a pretext for letting it loose. It is unfortunate when he that putteth on his armour boasteth himself as he that taketh it off; but M. FIEVET went further, and boasted himself when he saw another man putting on his armour as if he had seen it safely off again. There is no reason to suppose, however, that this revelation of M. FIEVET's Bonapartism will at all injure him with the Government. The little quarrel with the Duke of PADUA has not modified the general policy of Marshal MACMAHON's advisers. In fact, as has been very well shown by Mr. BEESLY in the current number of the *Fortnightly Review*, the real adviser of the MARSHAL has all along been the Duke of BROGLIE. The DUKE has not been inconsistent in playing first with the Legitimists and then with the Bonapartists. He has simply regarded both as instruments by which he may ensure the triumph of Orleanism, and when one has failed he has naturally had recourse to the other. In the first instance his object was to put the Count of CHAMBORD on the throne, in the hope of establishing an entire control over him based on a feeling of gratitude towards the authors of the Fusion. When it became known that the Count of CHAMBORD did not care to be restored on these terms, the DUKE gave him up, but he still tried to use the Legitimist party. Last May made it clear that this was an impossible policy, since the Legitimists were not willing, or, even if willing, would not be allowed, to befriend a Minister who was not prepared to go in, at least in words, for a Restoration at all hazards. There only remained the Bonapartists, and since the Duke of BROGLIE has been nominally out of office, the aim of the Government has been to find a *modus vivendi* for the partisans of the Septennate and those of the Empire. It is only fair to the Duke of BROGLIE to say that, to all appearance, he is not himself a believer in the restoration of the Empire at the close of Marshal MACMAHON's reign. Whether, if he did believe in it, he would be willing to alter his policy is another question, and it may be suspected that the detestation of the Republic which has already led him into such strange alliances would at first make him acquiesce in the rule of NAPOLEON IV. But at present he is probably convinced that he can use the Bonapartists for his own purposes, and then get rid of them. It is of great importance to the Orleanist party to keep the form of government undetermined until the prospects of the Count of PARIS become more assured, and, alike as Conservatives and as Orleanists, they are very anxious to get the present suffrage restricted in some effective way. The Bonapartists will work with them to secure the former end, because their candidate is as little prepared to take the field as the Count of PARIS. The one is not even a Pretender, but only a Pretender's heir; the other is an uncommonly young Pretender. By 1880 the latter defect will certainly have been remedied, and the former may have been; and the two factions can then pursue a common policy from different motives. Each has something to gain by waiting, and each thinks that it will gain more by waiting than the other.

It is not so clear how the Duke of BROGLIE proposes to obtain that restriction of the suffrage which he perhaps regards as the most important work of the Septennate. Upon this point the Bonapartists can scarcely give him any support. As a matter of principle, indeed, there is no particular reason why the advocates of unrestricted universal suffrage, as applied to plébiscites, should equally advocate it as applied to elections. When the sovereign people has expressed its will by a direct vote, its Parliamentary action becomes unimportant. But universal suffrage has been too serviceable a weapon in the hands of the Bonapartists to make it wise for them even to seem to disparage it. So long as the Duke of BROGLIE retains his influence over Marshal MACMAHON it is highly unlikely that the Assembly will be asked to dissolve itself without substituting the *arrondissement* for the department as the electoral unit. It may be that the Bonapartists would gain by this change equally with the Orleanists, and that in their hearts they would be very well inclined to support it. But the Bill will certainly be denounced as an attack upon universal suffrage, and after it has once been characterized in this way, it will be difficult for a Bonapartist deputy not to vote against it. Even apart from any effect which this redistribution of the voters might have upon the electors, the Bonapartists would no doubt be glad to see their adversaries repeat an old blunder, and give NAPOLEON IV. the opportunity of coming forward as the restorer to every

Frenchman of the sacred right of voting. But to help their adversaries to make this blunder for the purpose of profiting by it hereafter would be rather too barefaced a display of political immorality, and we may therefore look to see the Bonapartist deputies voting against the Government if an Electoral Reform Bill is brought forward. According to the latest rumours a Message from Marshal MACMAHON is to be read at the opening of the Session, the purport of which will be to insist on the necessity of passing the Constitutional Laws as soon as possible; and this Message will be immediately followed by the introduction of a Government Bill for organizing the Septennate. It is possible that this may be simply an expedient for putting off the discussion of any project for the organization of the Republic which may be brought forward by the Opposition. But it may also imply that the Duke of BROGLIE thinks that there is no time to be lost in making a final effort to get the suffrage altered. Every future election is likely, if it does not return a Republican, to return an Imperialist, and if both are likely to oppose any Electoral Reform Bill which the Government may introduce, it is essential to get the discussion taken while there is still a possibility of finding a chance Conservative majority strong enough to bear down the combined forces of the Bonapartists and the Republicans.

MECHANICS' INSTITUTES.

THE jubilee of the Alnwick Mechanics' Institute has been celebrated this week; and this, it may be presumed, indicates that the institution has lasted during some period of time which it pleases those interested in its success to think of. The occasion has been marked by the opening of a Fine Arts Exhibition, by the attendance of the Duke of NORTHUMBERLAND and Earl GREY at a public meeting, and by the announcement that the experiment of establishing a Society subsidiary to that of the Institute is about to be tried. This Society is apparently some sort of club where people who are as yet scarcely up to the level of the Institute may pass through the stages of cleanliness, decency, and an intelligent interest in things around them till they can begin to mount the great hill of knowledge in the precincts of the Institute itself. This jubilee, these gatherings of pictures and local curiosities, as occasion may offer, this notion of having a sort of humble Outer Court where the poor proselytes of the Gate of Learning may assemble, all appear to be excellent variations in, or additions to, the ordinary existence of a Mechanics' Institute. Both the great men who came to grace the jubilee spoke, as might have been expected, most favourably of Mechanics' Institutes generally, and of that of Alnwick in particular; and Lord GREY, who has been for many years a competent observer, was able to use language equally strong and just in describing the ignorance which prevailed when he was young, the progress which has been made, and the extent to which some sort of knowledge has been diffused. To this diffusion of knowledge Mechanics' Institutes have no doubt powerfully contributed, and the benevolent hopes of their founders have not been altogether disappointed. But time has made apparent one very important fact. These Institutes are the delight and resort of exceptional persons. They give a start and encouragement to the few, rather than attract, raise, or influence the multitude. A man to care about such a Society must already be clever, thrifty, and sober; he must have learnt to respect himself; he has become one of the elect of a local community. These Institutes are not sufficiently popular, entertaining, and simple to attract people who are only a little clever and a little good. It has been discovered that we must aim high or we shall not give scope to exceptional people; but we must also have other aims not so high, or we shall not give scope to any but exceptional people. A natural desire to get dividends forced this discovery on the Directors of the Crystal Palace, who began with imitating the Court of the Alhambra and the interior of Pompeii, and got down to afternoon pantomimes and BLONDIN. At Alnwick the Mechanics' Institute has gone on being very good for a long time, and has cultivated science and diffused knowledge, until at last it feels that it really is entitled to what is in grand language called a jubilee, and in popular language a little outing. It also finds that there must be something set up half way between it and those unenlightened people who decline altogether to have knowledge diffused among them. This is

not to be taken as a sign that the Mechanics' Institute is a failure, but rather as a sign that it is learning how to grow more useful. We trust that at its feet and under its shadow a club may grow up where people will not be expected to be too wise or too good, where the real tastes of members may be consulted, and where, if no very great amount of knowledge is acquired, at least a sympathy with knowledge is created and fostered.

Mechanics' Institutes were the creation of benevolence seeking to diffuse knowledge; and during the time that has elapsed since their first formation, benevolence has made as much progress as knowledge. That persons with leisure, means, and education should not live without doing something for others has now become so received a maxim of English life, that a very large proportion of these persons feel uncomfortable unless they adopt and carry out this maxim in one shape or another. It seems nothing more than natural nowadays that the Duke of NORTHUMBERLAND and Lord GREY should preside at a jubilee, lend their pictures, and express their interest in the avocations of their humble neighbours. The most eminent men in literature and science are always ready without fuss or affectation to address audiences who can neither pay nor understand them. Professor HUXLEY and Professor TYNDALL are the apostles of science to the many as well as to the few, and we may be sure that Mr. GLADSTONE would be as willing to lecture on HOMER in a Welsh cottage as to attend a debate on Home Rule. Such men, however, are, as it were, the Mechanics' Institute of benevolence. They are altogether exceptional. To the inhabitants of Alnwick there is but one Duke; there are not perhaps in all England more than three or four persons who thoroughly understand the scheme of creation; and the people not only has but one WILLIAM, but apparently does not wish for more. Around this central eminence of benevolence there has grown up a benevolent population, daily increasing, but with aims somewhat vague, and not as yet fortified with anything like the Alnwick jubilee, or organized into anything like the Alnwick club. The number of people in London also who long to do good in some public sort of way is simply astonishing. The metropolis becomes every year more and more the centre of excellent persons who have money, unbroken leisure, no special duties or cares, and well-principled wives anxious that their husbands should do themselves justice, and not be always hanging about the house. To be permitted to share in the government of any charitable institution or the advocacy of any cause, to go to meetings on any subject, and—if so fair a vision may be ever realized—one day to speak at one of them, is the wholesome and honourable aim of their lives. But it must be owned that they need something like the Alnwick club to be set up for their benefit. They want to be made a little more sensitive to the proportionate value of things, a little more attentive to facts and figures, a little more apprehensive of the fact that the mere grinding of benevolent machinery does not do much good. At present almost the only thing that in their case answers to the salutary restraint which the Alnwick club will no doubt impose on its members is the criticism to which they are exposed. If benevolent people hate anything, it is criticism; and so probably at Alnwick there will be at first a little feeling of bitterness and indignation towards the stern guardians of the rules who prevent more than the club allowance of beer—if there is to be beer—being drawn, or the new chairs being soiled by dirty feet. After a time the clubmen of Alnwick will own that they have been restrained for their own good; and after a time—we fear a rather long time—benevolent people, or their grandchildren, will own that the critics were of some use in their day.

The Duke of NORTHUMBERLAND, who made a very sensible and simple speech to his Alnwick friends, touched on a subject of considerable importance to those who wish to raise and help their countrymen. He observed that the knowledge which Mechanics' Institutes help to diffuse must be traditional. The most zealous attendants at these Institutes learn only the thoughts of other people. The same may be said of the vast majority of benevolent persons who belong to what are called the educated classes, and who want to do all the good they can. The amount of good they can do must depend in a great degree on the kind of education they have received, and on the knowledge and habits of mind they bring to the fulfilment of the task they set themselves. From this point of view the remarks on education which fell from Sir

JOHN LUBBOCK at Birmingham deserve careful attention. Do these well-to-do benevolent people receive the best education for their purpose which they could receive? Has all that could be done to train them well been done for them at the schools and colleges where they have been brought up regardless of expense? As Sir JOHN LUBBOCK concedes that the moral, social, and physical training they receive at those institutions is on the whole satisfactory, nothing need be said on these important heads. No general reform of English school and University life is needed. It is only of the intellectual training given at these institutions that it is necessary to speak. Sir JOHN LUBBOCK dilated with great force on the bad effects of the subordination of literary to philological interest in the study of the classics, on the exclusiveness of the study of the classics, on the absence of any grounding in physical science, and on the slightness of the importance attached to the language and literature of living nations. If the subject were to be discussed in its general bearings, very much might be said in justification of the present system. If we look at the best scholars, it may be urged that their literary taste and culture are placed on the surest foundation by their having been made to go first through the dry technicalities of philology. If we look at the stupid boys, it may be urged that they are at least saved from seeking to veil their stupidity by the acquisition of an ignorant smattering of many things. But if we look at the grown-up men who leave school and college and apply themselves to the task of bettering the condition of their countrymen, it is difficult to escape the conviction that more might have been made of them while they were young. They have scarcely any knowledge to diffuse, and such knowledge as they have is not the sort that is wanted. They have to address artisans without any knowledge of mechanics, to reason with them on strikes without any knowledge of political economy, to hear of what good is being done on the Continent without being able to understand the publications in which it is described, and to speak in public without ever having realized that classical orators were eloquent and that classical poets were poetical. They have to approach the difficult work of improving the health of the community without any acquaintance with the structure of inanimate nature or of the human body. No school or college could indeed do very much to help them. They must be content to learn as they go on, and to be made wise by experience. But school and college might do more for them than is done at present; and as their very desire to do good in their generation is itself in a large measure the product of the active life and wholesome moral and religious teaching of the places where they have been educated, it may be regretted that more care is not taken beforehand to ensure that they shall be qualified for the work on which they are to enter.

THE ANNEXATION OF FIJI.

IT was apparent from Lord CARNARVON's language during last Session, notwithstanding Mr. DISRAELI's subsequent disclaimer, that the Government had determined to accept the cession of the Fiji Islands. It was prudent before a final decision was announced to employ a confidential agent to make inquiry on the spot; but in conferring on Sir HERCULES ROBINSON full power to conclude the arrangement, Lord CARNARVON had virtually approved the policy of annexation. It was highly improbable that the QUEEN'S Commissioner would discover insuperable objections which had not previously occurred to the Government, and, in selecting the Governor of New South Wales to form a final decision, Lord CARNARVON indicated his opinion that the judgment and wishes of the Australian colonists were entitled to consideration. It may be taken for granted that Sir HERCULES ROBINSON has made some reasonable settlement of matters of detail, including the assumption of liability for debts honestly incurred, and the provision of competent allowances for the KING and the chiefs, who will perhaps henceforth be made useful in subordinate capacities. The English adventurers who worked the puppet machinery of native royalty may also be excused if they have made some provident bargain for themselves. Some of them may perhaps be trusted to employ under strict supervision their local knowledge for the public benefit. If there are still indigenuous Pretenders who have

not consented to the suppression of their nominal independence, it may perhaps be found necessary to pay some additional compensation. A vigorous and experienced administrator will have disposed of minor difficulties without waiting for minute instructions from home. The whole transaction can scarcely cost as much as an ironclad man-of-war; and after a short time the insular Government ought to be self-supporting. It is stated that, as might be expected, the land tenure of a country divided between uncivilized tribes and lawless European or Australian settlers is in a confused and uncertain condition. The suggested remedy is the establishment of official control over all transfers of land; and probably the local Government will both possess a domain of its own and be able to levy moderate taxes on private estates. It will be desirable to avoid as far as possible the imposition of duties on commodities. In a settlement governed directly by the Colonial Office, the maintenance of perfect free trade will furnish an instructive contrast to the narrower Protectionist doctrines of the democratic Australian colonies.

It cannot be said that English opinion, as it is expressed by political writers, is in the present day unduly favourable to territorial extension. The theorists who would willingly surrender all colonial possessions, though they form a small minority among politicians, have nevertheless produced an impression that the dominions of England are rather too large than too small. Although no strong disapprobation has been caused by Lord CARNARVON's policy, nearly every commentator has taken the opportunity to disparage the value of the new acquisition. Traders to the South Pacific and Australian colonists entertain a different feeling. By an opportune coincidence the Government of New Zealand has, almost at the exact date of the acceptance of the cession of Fiji, publicly expressed its hope that at some future time the colony may become the centre of a great Polynesian dominion. English philanthropists will be shocked at the suggestion that a commercial Company should be formed in New Zealand for the avowed purpose of acquiring political influence in the South Pacific regions. Although the Fiji Islands are separated from the nearest point of the Southern Continent by hundreds of miles of sea, they look on the map like neighbouring countries; and it would have been thought an intolerable grievance that they should be occupied by any foreign Power. Geographical illusions are difficult to dispel. In spite of the unknown expanse of wilderness which separates West Australia from the Eastern and Southern colonies, New South Wales and Victoria would probably have broken off their allegiance to England if the Home Government had, in compliance with the wishes of the West Australians themselves, continued to transport convicts to those remote regions. Queensland is more closely connected by commercial intercourse with the Fiji Islands than Melbourne or Sydney with the ports of Western Australia. Irregularities and outrages were from time to time perpetrated in the islands by Australian mariners, and the consequent inquiries were instituted before Australian Courts. It was in many ways expedient that the two countries should be brought under the same authority; and the colonies have no facilities for organizing a sub-colonial system of dependencies. The acquisition of the sovereignty of the islands, even if it should prove to be in some degree burdensome, naturally devolved on the Imperial Government. The missionaries have, greatly to their honour, prepared the way for civilization, and with proper encouragement they will probably soon reclaim the wild remnant of the population in the mountains.

Although Lord CARNARVON deserves credit for his resolute adoption of responsibility, the abandonment of more timid counsels was the result of time and observation. Only five or six years have passed since Lord GRANVILLE, who was more than any other Colonial Minister opposed to the principle of colonial empire, pre-emptorily rejected the proposed cession of the islands, and even announced a doctrine to which few Englishmen would assent. In answer to a suggestion that, in default of English annexation, the islands would probably be offered to the Government of the United States, Lord GRANVILLE declared, in a despatch which was afterwards published, that his Government would prefer an American annexation of Fiji to the cost and trouble of undertaking the task themselves. It is fortunate that the disposition of the actual President to extend the dominions of the Federation has not been shared by the Senate or by the

bulk of the dominant party. The transfer of the Fiji Islands to the United States would have involved the exclusion of English commerce by a restrictive tariff, as well as frequent risk of collisions which might have led to international difficulties. Forty years ago the timidity or indifference of the English Government nearly resulted in the conversion of New Zealand into a French settlement. It appeared from a recent speech of Mr. GLADSTONE's on the proposed annexation of Fiji, that he still regrets the establishment of a great English community in New Zealand, because it cost in former times a considerable sum of money and a certain number of lives. The asceticism which can annihilate the human defects of patriotic self-complacency and ambition is at least as rare as it is admirable. One of the strongest reasons for believing that the annexation of Fiji is not inexpedient may be found in the disposition of Mr. GLADSTONE's latest colleague at the Colonial Office to anticipate the policy of Lord CARNARVON. The convenience of an additional naval station between Australia and the Pacific coasts of America might well appear to Lord KIMBERLEY an equivalent for the limited expense and trifling risk of acquiring a new colony.

The motives which induced the English Government in the last century to acquire the greatest possible number of colonial possessions no longer exist in equal force. No colony is now compelled to confine its market to English goods, nor are tropical and sub-tropical regions cultivated as profitably as in the days of negro slavery. It is nevertheless found by experience that English products are preferred in the colonies through the mere operation of fashion and of habit. It would no longer be thought worth while in a war with any European Power to conquer the colonial possessions of France, Spain, or Holland; but wherever English adventurers have established an irregular authority over uncivilized tribes, there is a strong presumption in favour of formal annexation. The advisers and Ministers who provided Fiji with a constitutional King, a Parliament, and a Cabinet, were good judges of the capabilities of the country into which they introduced crude copies of their own national institutions. There is evidently money to be made, where it was found possible to create in a few months a considerable national debt. The rights of the natives were perhaps not always scrupulously regarded by their English rulers; but under a regular Government ample securities will be provided for the administration of equal justice. It is due to the memory of the Duke of NEWCASTLE to state that twelve or fourteen years ago, in spite of the unfavourable report of a Commissioner appointed by himself, he urged on Lord PALMERSTON's Government the annexation of the Fiji Islands. He was defeated by the indifference of his colleagues and by the passionate opposition of Mr. GLADSTONE, who has always been consistent in his dislike to an Imperial policy. As far as the acquisition has been made without the efforts and against the will of statesmen, it must be attributed to natural causes, which are less fallible than human judgment. It would be unreasonable to expect that Fiji with its relaxing climate will, like New Zealand, hereafter expand into a great and flourishing community of English blood and language; but the native population will have a better chance of civilization under an English Government, and the resources of the country will be made useful and developed.

MR. BRIGHT'S LITTLE LETTERS.

MR. BRIGHT, although he has withdrawn, at any rate for the time, from active public life, has apparently by no means ceased to be a handy oracle at the service of his devotees. He has retired from the platform to the closet, but from the closet he keeps up a brisk epistolatory fire upon the outer world, and discharges his dogmas in letters instead of in speeches. The number and variety of the subjects on which he is consulted, and the business-like regularity with which he appears to reply to all inquiries, remind one forcibly of that wonderful column of answers to correspondents with which the editors of certain popular journals endeavour to satisfy the boundless curiosity or to correct the equally inexhaustible ignorance of their readers. It would seem as if anybody who was troubled with a doubt or difficulty on any question had only to write to Mr. BRIGHT in order to receive by return of post an infallible

response. It is impossible to say what may be the extent of this remarkable correspondence, for we know it only by the casual selections which are published from time to time, but it may be supposed that it ranges over almost all subjects of human interest. It is conceivable that Mr. BRIGHT's good-natured readiness to answer letters may already have brought down on him many urgent inquiries as to the best kind of hair-dye or the most economical sort of soap for a family washing; but his revelations on these subjects, if he has made any, have at least not been imparted to the world. There are, however, one or two matters as to which Mr. BRIGHT's correspondents have been good enough to let us know his views, and we cannot say that we are favourably impressed either by the wisdom or the temper which are thus displayed. It is possible that a man of Mr. BRIGHT's standing and political influence might, by taking the trouble to clear up the difficulties of distracted correspondents, and to give them distinct ideas as to the true bearings of the controversies by which they are perplexed, render an important service. But Mr. BRIGHT unfortunately, in his haste to write, appears to have himself neglected to give thorough consideration to some of the questions on which he passes an offhand judgment in the most dogmatic terms.

It is not very long since Mr. BRIGHT, when in office, startled most persons by his enunciation of the theory that the adulteration of goods is only a form of competition; and he has now asserted the right of unlimited freedom in the propagation of disease. A letter from Mr. BRIGHT was read at a Conference of Anti-Vaccinators, as they call themselves, which was held the other day at Birmingham. The object of the Conference was to get up an organized agitation against vaccination, and Professor NEWMAN, who was in the chair, read a paper advocating defiance of the law as a patriotic duty. Mr. BRIGHT's letter was to the effect that he would not express any opinion on the main question—that is, the medical value of vaccination—except to say that the facts which had come before him seemed to be against the anti-vaccinators, but that he doubted the wisdom of compulsion, and had always felt that “the law which inflicts ‘penalty after penalty on a parent who is unwilling to ‘have his child vaccinated is monstrous, and ought to be ‘repealed.’” It is not surprising that the latter part of this letter should have been applauded by the meeting, which was thus encouraged in what the Chairman had called the patriotic duty of resistance to the law. Whether vaccination in itself is a good thing or a bad thing is a question on which there is undoubtedly some difference of opinion, just as there is on the question whether the earth is round or flat. The balance of scientific authority is overwhelmingly one way, but of course if any one is not convinced of the beneficial effects of vaccination, it is very natural that he should object to its compulsory enforcement. But Mr. BRIGHT does not pretend to have any doubts on the point. He is obliged to admit that, as far as his own observation and experience go, vaccination is a good thing; and this must necessarily be the conclusion of any impartial person who looks into the matter. On the one side there are some cases, many of them doubtful, in which it is said that vaccination has been attended with injurious consequences; and on the other side there is the matured judgment of medical science that vaccination is an important preventive of an attack of small-pox, and an almost absolute security against death by small-pox, and that the risks of the operation are extremely slight. Mr. BRIGHT does not attempt to dispute this judgment; yet he argues that compulsion in such a case is “monstrous”; that is to say, it is monstrous that society should endeavour to protect itself against the ravages of an extremely infectious disease of the most loathsome and dangerous kind by insisting upon everyone being subjected to a process which has been shown by abundant experience to be at the least a very valuable check on the spread of the malady. It would seem to be more reasonable to apply the word “monstrous” to the reckless infection of the community through the perversity or fanaticism of a small minority. It is obvious that, unless vaccination is uniformly enforced, there will be always a certain number of persons who on various grounds will refuse to have their children vaccinated, and will thus establish a reserve of contagion for general distribution. It is also clear that, if vaccination is to be enforced only by the infliction of a single fine, this will be only another way of granting exemption on the

payment of a fee; and it is difficult to understand why a community of sane people should be expected to allow any one to purchase the privilege of tainting it with a horrible disease. It is surely one of the first duties of the State to protect the health of the people at large. The simplest and most natural way of carrying out this protection would of course be not to punish a parent for refusing to have a child vaccinated, but to take care that the child is actually vaccinated, whether the parent likes it or not. When this was proposed before a Select Committee of the House of Commons, a protest was raised against the intervention of a policeman between a mother and her baby; but the intervention of a constable is not unusual when a child is being ill-used. Compulsory vaccination is required both for the sake of the child and of the community; and if the child is not to be vaccinated by force, there is no alternative but to impose “penalty after ‘penalty’” on the parent until he complies with the law. This is the usual way in which laws are enforced. It is to be feared that Mr. BRIGHT's rash and wanton vindication of free-trade in small-pox will tend to encourage the perverse propagation of that terrible distemper.

Another matter on which Mr. BRIGHT has lately been expressing his views is that relating to the closing of public-houses in Ireland on Sunday. At first sight the question seems a very simple one, and it is probable that Mr. BRIGHT did not pause to consider the logical consequences of the principle which he has somewhat rashly laid down. There can be no doubt that on this, as on all other Irish questions, the opinion of Irish members ought, as he said, to have a special weight. The hours during which public-houses shall remain open is to a great extent a matter of local convenience, and the opinion which is formed by those who possess a knowledge of local circumstances and requirements is very likely to be right. It is one thing, however, to give special weight to local opinion, and a very different thing to accept local opinion as necessarily decisive and beyond appeal. Yet this is the length to which Mr. BRIGHT seems to be prepared to go. He assumes as a fact that the great majority of Irish members are in favour of Mr. SMYTH's Bill. This is not the case, for, as it happens, the Irish members are divided on the question and the majority of them did not vote at all. But even if it were true that the great majority of Irish members were at one on this or any other subject, it does not follow that English and Scotch members should on that account be bound to stand aside and to allow the Irishmen to settle the matter entirely in their own way. The object of having an Imperial Parliament is of course that the different parts of the kingdom may be governed on uniform principles; and though the views of local representatives must always be an important element in deciding any question, it would be an obvious stultification of the essential principle of a central Legislature to allow these views to be, as a matter of course, predominant. What the Irish members have to do is to convince the English and Scotch members that what they propose is just and expedient in itself; and unless the House of Commons is really satisfied on this point, it is bound to resist local pressure. It would simply be abdication of its functions if it attempted to transfer the general responsibility of the whole body to a section of its members. It is perhaps too often forgotten that there is not only a majority but a minority in Ireland, and that, while reasonable efforts ought to be made to satisfy the former, the latter is also entitled to protection. It is perhaps a small matter whether public-houses in Ireland are or are not to be closed on Sunday; but much more serious issues are involved in the rule which Mr. BRIGHT is anxious to help the Irish members to establish. It is evident that it concedes not merely the principle of the Permissive Bill, which Englishmen, as they object to it in their own country, may fairly oppose when it is proposed to be applied to Ireland, but also the more dangerous principle of Home Rule, or the right of a majority of Irishmen to govern Ireland according to their own pleasure without reference to the opinions of the inhabitants of the rest of the kingdom. If this were once admitted, whether the Irish delegates sat in Dublin or London would be only a detail. It is the duty of the British Parliament to manage Irish affairs, not in such a way as merely to please a majority of Irishmen, but in the way which it has satisfied itself is best both for the people of Ireland and for the general interests of the Empire. Some day perhaps there will be a complete collection of Mr. BRIGHT's little letters, and it will then be seen how far the samples which have lately been published represent

the general character of the correspondence. In the meantime it is impossible not to deplore the mischief which may be done by an influential politician who circulates crude and hasty opinions on subjects which he has evidently not taken the trouble to think out seriously.

SANITARY POLICY.

THE town of Darwen seems determined to constitute itself a typical instance of sanitary degradation. Every variety of danger to which the public health can be exposed is there left to flourish without let or hindrance. The Medical Officer sent down by the Local Government Board to ascertain the cause of an epidemic of typhoid fever from which the town is now suffering declares that in all his experience he has never seen so bad a case. There are streets and alleys, with houses on each side of them, and the central space a series of only partially covered cess-pools. In the backyards of many houses there are cess-pools unprovided with even a partial covering. At other points "you may walk for sixty yards and find nothing but ashpit, cesspool, ashpit, cesspool, the whole way." Where the soil is in this condition, the water supply is not likely to be pure, and Dr. STEPHENS reports that, as a matter of fact, it is largely contaminated with sewage. The sanitary authorities have taken no measures to abate these nuisances, and in Monday's *Times* there is a letter from the Vicar of Over-Darwen calling for some new and stringent legislation which shall put an end to the freedom at present enjoyed by the local authorities all over the kingdom to leave their duties undone.

Mr. MOORE's indignation is exceedingly natural and well grounded. Before, however, he asks for new laws in this direction, it would be well for him to consider whether more might not have been done under the existing laws to get Darwen put into a healthy state. "Who hopes," he asks, "to find anywhere in England a department of 'Government which has power to compel as well as to recommend?'" It is an unfortunate question, because there already exists a department armed with very extensive powers of the kind which Mr. Moore desires to see created. Whenever complaint is made to the Local Government Board that a sanitary authority has not provided its district with sufficient sewers, or has not prevented existing sewers from becoming a nuisance, or has not provided the inhabitants with a sufficient supply of wholesome water, or has not done a variety of other duties laid on it by the Statutes relating to Public Health, the Local Government Board must order such sanitary authority to execute the necessary works within a prescribed time, and if they are not executed by that time the Local Government Board must appoint some other person to execute them, and charge the expenses to the defaulting authority. If these powers had been exercised in the case of Darwen all the evils disclosed by Dr. STEPHENS's Report might long since have been remedied. Mr. MOORE will perhaps ask what is the use of investing the Local Government Board with such powers if they are to remain unexercised. This is a very pertinent inquiry if it should appear that Mr. MOORE and those of the inhabitants of Darwen who think with him have done their part in the business. Mr. MOORE says, "A Commissioner was sent down twelve years ago, and he reported, and the state of things described then 'remains unaltered yet.' The local Medical Officer of Health also reported to the same effect last spring, and 'warned the Local Board that, if they did not take decisive measures to prevent it, they might expect a serious outbreak of sickness in the autumn.'" Have Mr. MOORE and the decent inhabitants of Darwen done what they could towards making the town what they wish to see it? When the Public Health Act was passed did they call upon the sanitary authority to do its duty by the town? When it became clear that the sanitary authority was not going to do its duty, did they use their influence with the ratepayers to get a more active Local Board elected? If there has been no opportunity for taking this course, or if it has been taken and has failed, have they made any formal complaint to the central authority? For example, when the Local Medical Officer of Health made his Report last spring, was it sent to the Local Government Board with a request from certain of the townspeople that the sanitary authority might be ordered to remedy the evils described in that Report, or, in the event of its failing to do so, that

the Local Government Board would assign the duty to some one else?

It may be that Mr. MOORE has done all this, and that the Local Government Board has still refused to act. But there is no trace of anything of the kind in his letter, and his desire for new legislation on the subject seems to show that he has not made himself acquainted with what legislation has already done for him. In the present state of public feeling on sanitary subjects the utmost that the Local Government Board can be expected to do is to take the part of an intelligent minority against an ignorant and parsimonious majority. But, in order that it may do this, there must be due diligence on the part of the intelligent minority. They must show that they are anxious to help themselves, or at the least that they are willing to take the trouble of asking the Local Government Board to help them. It must never be forgotten in dealing with these matters that the success of sanitary administration will in the long run be strictly proportionate to the interest taken in it by the persons directly concerned. Whenever the majority of the inhabitants wish the district they live in to be clean and wholesome, there is no need for the central authority to interfere. If there be any district in which all the inhabitants prefer to be dirty and diseased, it is hard to see how the central authority can interfere to any purpose. Where, however, there is a well-disposed minority it is undoubtedly the duty of the central authority to support it against the majority which is not well disposed. Only it must rest with the minority itself to make its existence known to the central authority; and before condemning the Local Government Board for what, *prima facie*, is its culpable inaction in the case of Darwen, it is necessary to know whether its aid has ever been invoked by those who complain that it has been withheld.

There is some danger that the progress of sanitary reform in England may be hindered by the refusal of some of its friends to recognize the conditions under which alone it can, as a matter of fact, be effected. As some remarks that we made upon this subject three weeks ago have been criticized in various quarters, it may be well to restate shortly the substance of what was then said. The principle upon which the sanitary work of the Local Government Board is at present carried on is this:—The communications of the Board with the local authorities upon sanitary as upon Poor-law matters are conducted by a body of Inspectors. The Inspectors are chosen for their general intelligence and capacity, and a professional medical training is not an indispensable qualification. Some of them may be lawyers or engineers, as others are, we believe, medical men. The questions with which they have to deal are not exclusively medical, and it is thought desirable to take the best men that can be got out of a wide choice. A staff of Medical Officers is attached to the Board, to which these Inspectors can refer upon all questions where the opinion of an expert is required. A staff of Civil Engineers is also attached to the Board, and to this the Inspectors can equally refer when questions involving special engineering knowledge present themselves for decision. This is the system at present in force, and, whatever defects may be discoverable in the administration, we regard it as a sound system. Our critics would like to substitute for this a system under which the Medical Officer of Health to the Local Government Board would be in direct communication with all the Medical Officers of Health in the country, and through them would exercise, by means of Medical Inspectors subordinate to himself, a "concentrated superintendence of all public sanitary arrangements." We are not concerned to prove that the existing system is better than the system which these gentlemen wish to put in its place. It is enough to say that the concentrated and centralized superintendence here spoken of would not be in existence for twelve months without producing a reaction against sanitary reform which might operate for half a generation. If Mr. SIMON had been put into the position of Permanent Minister of Health when the Act of 1872 was passed, the overthrow of the Liberal party would probably have turned upon this as much as upon beer or Education, and the right of every Englishman to sit upon his own dunghill might have played that part in Conservative oratory which was assigned to the flowing barrel and the open Bible. Those who think that Medical Inspectors would be welcome everywhere may be thankful that there is no chance of their expectation being put to the test. That the

medical staff has been welcome, and deservedly so, under the existing system is nothing to the purpose. At present they go wherever their special scientific experience is needed and sought for. It does not follow that they would be equally welcome under a system which would make them the ordinary superintendents of sanitary matters throughout the country. We have been further taken to task for describing the prevention of disease as little more than a matter of common sense. To us, however, it seems self-evident that it is only in so far as the prevention of disease is a matter of what may be called common sense that it can, to any practical purpose, be made incumbent upon Town Councils, Local Boards, and Guardians of the Poor. To say this is not to deny the existence of a most important field of scientific investigation in relation to the prevention of disease. But until the results of scientific investigation have become, so to speak, the common property of the educated public, it will not, in point of fact, be found possible to give them universal application. If the Local Government Board were to declare a sanitary authority in default for not carrying out a conclusion only known perhaps to half a dozen of the highest medical authorities of the day, it would run a serious risk of having its powers in this respect curtailed by the action of Parliament.

FLIES IN OINTMENT.

THE charm of exquisite poetry depends, as every one knows, upon subtle harmonies of language which can be recognized, though they can hardly be analysed by the finest critical sense. It might trouble the acutest observer to explain why one special combination of words goes home to our feelings, when another, expressive of the same thought, appears to be the merest commonplace. Who can tell, for example, what is the special felicity which makes Herrick's little song "Gather ye rosebuds while ye may" unflinchingly delightful, whilst hundreds of other poets have made precisely the same remarks about flowers and the shortness of life, and have yet sunk at once into utter oblivion? To say something that has been said thousands of times before, and yet to make the saying impressive, is a triumph of art the secret of which is simply inexplicable and incommunicable. A curious example of the same power exerted in a different direction is to be found in Cowper's verses on the Royal George. We saw them quoted not long ago with the judicious remark that people had generally taken them for poetry because they were written by Cowper, as if Cowper had not written other verses which are as extinct as last year's prize poem. The ingenious critic, however, had observed that there was nothing on the surface of the poetry except a newspaper paragraph done into rhyme. There is hardly a single reflection; we are told in the plainest possible manner that the ship went down because a land breeze caught the shrouds whilst she was laid upon her side; and that Admiral Kempenfelt was drowned with eight hundred, or, as it is elsewhere stated, "twice four hundred," men. Where does the poetry come in? To this question we cannot give a distinct answer; but anybody who can rhyme may discover by a very simple experiment that it does come in somewhere. Let him put into the simplest possible verses any newspaper paragraph that strikes his fancy—the loss of the *Birkenhead*, for example, in itself a far more poetic incident—and see whether his lines will instantly seize the memory of all who read them. In other poems of Cowper's, in the verses on Mrs. Unwin or on his mother, we can easily account for part of the impression by the depth of the pathos, though the question still remains how the pathos is conveyed so powerfully. But the singular felicity by which, without any apparent assistance, and with even some distinctly prosaic lines, the unadorned narrative becomes so unforgettable, is in some sense a still more striking proof of Cowper's wonderful power.

If the harmony on which the effect of a poem depends is so subtle as to escape all powers of analysis, the inverse phenomenon is luckily not quite so conspicuous. A single discord, that is, does not destroy our pleasure as the harmony creates it. After a little familiarity we become comparatively insensible to its existence, and even think it rather profane when anybody insists upon pointing it out. And yet there it is; in many almost perfect poems there is a little slip somewhere, a fault of expression, a defect in the grammar, or, possibly, a want of logic, which slightly irritates us, and makes us wish that we could recall the poet from the dead in order to insert an amendment. To dwell upon such faults may be invidious; and yet it is perhaps worth while to notice the fact as illustrative of the advantages of thorough finish which most of our young poets are too slovenly to care about. When we know some fine passage by heart, we shrink instinctively from the coming jar, as we draw back when we see that a carriage is about to jolt over a stone on an otherwise smooth road. The frequency of such little annoyances varies greatly in different poets, and they are sometimes much more abundant in the first-rate than in very moderate performers. In Shakespeare, of course, one might point out any number of them; but Shakespeare has the advantage that we may attribute what we please to corruptions of his text; and, moreover,

in a style so weighted with thought and so full of abrupt transitions, it is scarcely possible to notice any trifling discord. It is swallowed up in the general harmony and drowned in the impetuous torrent of thoughts. Amongst modern poets, Shelley is probably more fertile in such imperfections than any other—a fact which is no doubt owing in great part to the excessively careless printing of his poems; and partly to his being carried away in what he calls the "swift stream of song" until he forgets the humble ties of grammar and logic. Amongst living poets, Mr. Tennyson's singular refinement almost invariably preserves him from any decided blunder; he is much more apt to err on the side of excessive smoothness than to admit unnecessary discords. Mr. Browning's habit, on the contrary, of riding roughshod over all the minor difficulties of language leads to so many harsh phrases that we are unable to pick out any particular instances as offensive. We expect to be jolted in every line, and brace ourselves to wrestle with his vigorous thought till we become insensible to minor bruises.

Nothing would be easier, however, than to compile a long catalogue of these trifling annoyances without going beyond poetry of a really high order. Not long ago there was a lively discussion as to Byron's vulgarity in using "lay" for "lie" in the address to the sea. The blot, however, could not be expunged. Various parallel passages were produced from Shelley and from authors of the seventeenth century. In fact, the error belongs to a class which poets have seldom the resolution to avoid, though the instance happened to be specially offensive. The search for rhymes is very fatal to a due regard for the niceties of English grammar. When "sang" would come in conveniently, why should a poet be driven out of his path by the prosaic grammarian who insists that "sung" is the form sanctioned by ordinary practice? Shelley, for example, speaks of the tempest

Riving sail and cord and plank
Till the ship has almost drunk
Death from the everbrimming deep;

and Milton, in the Christmas Hymn, cannot resist the temptation of bringing in "sang" instead of "sung" to rhyme to "hung." Why should two words which seem to have been intended by nature to run in couples diverge in such a provoking fashion so as just to miss the desired harmony? Is it not fair to force them into the harness and to admit that a poet is "super grammatician"? The case is so common that perhaps there is something like a precedent for the gentle violence done to such impertinent words. But the case is rather more annoying when the same unfortunate necessity causes a downright vulgarity. Kents, as his readers know, has an unlucky Cockney twang, which intrudes every now and then when he is singing the praises of classical gods and goddesses in the most delicious melody. But the exemplary Wordsworth was not a Cockney, and surely he might have found some means of getting round that unlucky rhyme in the great Ode:—

Oh! evil day if I were *sullen*
While earth herself is adorning
This sweet May morning
And the children are *pulling*, &c.

Luckily a critic is not bound to suggest a conjectural emendation; but we would rather have had the rhyme left out altogether than be haunted by the suspicion that Wordsworth talked about "sulling" or "pullin'"—whichever alternative may be adopted.

There is another kind of minute slip, rather different in character from this, where the poet seems either to have forgotten his punctuation, or to have attended less to the sound than to the writing. We always admired the fine verse in which Milton describes the appearance to the shepherds of

The helmeted cherubim
And sworded seraphim;

but one day it unluckily occurred to us that, if the verse were recited instead of read, there would be some risk of the seraphim being most inappropriately stigmatized as "sordid"; and we must admit that we have ever afterwards been sensible of a certain qualm in reading what are in every other respect magnificent verses. Or, again, in Gray's *Elegy*—a poem which may be regarded as an almost unrivalled example of the power of perfect finish to elevate obvious reflection into true poetry—we can never adjust a certain comma satisfactorily. He says of his peasants:—

Far from the madding crowd's ignoble strife
Their sober wishes never learnt to stray.

According to all grammar this surely ought to mean that the sober wishes never strayed far from the ignoble strife; which is of course the opposite of what Gray intended, and would clearly be less creditable to the sobriety than to the simplicity of these excellent countrymen. Another ludicrous inversion of ideas of a rather different kind worries us in regard to an otherwise touching poem. When Hood describes "the one more unfortunate" who has apparently drowned himself in the Thames, he invites the dissolute man to think of the sad catastrophe by the river-side, and adds—

Lave in it, drink of it
Then if you can.

It is doubtless very wrong, but we can never read the verse without remembering that the last use a dissolute man would make of the Thames would be to "lave in it" or "drink of it," even if nobody had ever been drowned in its waters. If that were the only privation due to his repentance, it would not be a severe one.

Another variety of grammatical blunder is simpler, and consists in simply leaving out some essential clause in a sentence. Shelley

is not unfrequently guilty of an error which will vex schoolboys when English is a dead language; but the first example which occurs to us is from a charming little poem by Keats. It concludes—

To know the change and feel it,
When there is none to feel it,
Nor numbed sense to steal it—
Was never said in rhyme.

What was never said in rhyme? Of course we could suggest an answer, but we had rather that the poet had told us in plain language. Violent grammatical confusions of a still worse kind are very common, as we may remark, in Pope's elaborately polished verses. They are annoying, though we feel that they are partly pardonable as the result of an effort to compress too much meaning into a specially rigid framework of verse, and not to simple laxity of attention.

Leaving merely grammatical defects, we might notice the more serious vexation caused by the intrusion of downright fragments of prose into the midst of exquisite poetry. Wordsworth is perhaps the greatest offender in this sense, and the fault occurs not only in the longer poems, where he cannot be expected to maintain himself constantly at his usual elevation, but in the undigested fragments which intrude even into his lyrics, and which annoy one, if we may be pardoned for the prosaic comparison, like the hard pellet of shot which one's teeth crunch in the midst of the tender breast of a partridge. We almost shrink from mentioning instances, but we may sufficiently indicate the nature of the case. In the poem on *Peelo Castle*, after telling us how differently he should have conceived the future at an earlier period, he adds:—

Such in the fond illusion of my heart,
Such picture would I at that time have made.

The second of these lines strikes us as unnecessary verbiage, a mere repetition of what has been said before, and dragged in to eke out a stanza. Or we might turn to a very different poet and remark what an uncomfortable effect is produced in Campbell's spirited verses on Nelson and the North, when the inspired bard suddenly becomes a lawyer, and inserts a clause in the agreement with the Danes to prevent all possible evils:—

But yield, proud foe, thy fleet
With the crews at England's feet.

As if the Danes would have taken them out if they had not been expressly prevented by the terms of the treaty. But we are perhaps hypercritical, and it is not a pleasant task to hunt out mere lapses into prose, though we feel that we have a kind of right to resent positive offences. The most irritating of such errors is of course the introduction of a sheer conceit such as disfigures the poetry of Donne or Herbert, or as is commonly exemplified by Milton's unlucky "sun in bed," who "pillows his chin upon an orient wave." It is a comfort to reflect that he left off talking about the sun's chin in his maturer poetry. The offence has become rare, though we should be sorry to say too positively that we are not on the eve of another outburst of the poetry of mere conceits. Modern writers seem to be so eager for some new source of excitement that they may perhaps try this device as well as others. Hood is the only late writer of genius who has distinctly yielded to the temptation in some familiar instances. Everybody quotes the end of his familiar lines:—

It was a childish ignorance,
But now 'tis little joy,
To know I'm further off from heaven
Than when I was a boy.

To us they appear to be not only too ingenious, but to involve an uncomfortable awkwardness of expression. The poet does not really know that he was further off from heaven than when he was a boy, for he is just at the same distance; he should have said, to be logical, that he knows himself to be further than he knew when he was a boy. It may, indeed, be replied that we are growing too logical, and that poetry has nothing to do with logic. Without arguing the particular instance, we admit the general principle. Accuracy of thought is desirable in poetry as elsewhere, though we willingly agree that a pedantic regard for syllogistic forms would be most undesirable in genuine poetry. We will conclude our miserable cavilling with one illustration from Clough's *Bothie*—to our taste, though we believe that we differ from most readers, the most beautiful of his poems. Elspie, in a charming passage, says that she feels as though she had been building herself up like a bridge, one stone on another:—

"All on one side, I mean; and now I see on the other
Just such another fabric, uprising, better and stronger,
Close to me, coming to join me."

And so she continues very gracefully and touchingly; and yet it is possible for the most unmechanical of mankind to read the passage without reflecting that a bridge which is stronger and better on one side than the other is likely to be a very unstable bit of workmanship?

COMO.

IT was by the side of the Lake of Como that Dr. Stanhope, according to Mr. Anthony Trollope, had his villa and made his collection of butterflies. One can fancy that it was in some points pleasanter living there than either at Barchester or at Eiderdown. If one wished to dream away life, one could hardly desire a place better suited for the purpose than the shores of one of those

Italian lakes; and yet they suggest a great deal besides matter for dreaming. The professed climber would most likely despise the heights immediately above the Larian Lake; yet there is a good deal of snow within sight from more than one point of it. The geographer will be relieved from all difficulties on that one of the greater lakes which is wholly Italian, and no part of whose shores is either Austrian or Swiss. The Swiss frontier indeed comes amazingly near to the city of Como; but from the lake itself it seems, as it were, studiously to keep away, as if to make up for the large share of the Lake of Lugano which the Confederation has taken to itself. Then the sides of this lake, as of its fellows, are so thickly inhabited, there is such an endless succession of houses, villages, and churches, dotted up and down over the mountains, that there are few places where the general effect of the Italian style of building, as applied to something other than great cities, can be better taken in. And almost our first thought is the extreme unpicturesqueness of most of the buildings which find themselves in such picturesque sites. It is so throughout Italy. A small Italian town perched on a hill-side or a hill-top ought to add to the effect; but it seldom does so. In some of the most striking points of Tuscany and Umbria one cannot help wishing to exchange the little towns and villages on the heights for some of the picturesque little towns of Franconia, with their gates, towers, spires, an outline of some kind about everything. The ruined castle, so common along the Rhine, is rare, though not absolutely unknown, among the Italian lakes. When it is to be seen, the picturesque element at once comes in; otherwise an Italian village has everything so white and flat as not to be an addition to the landscape, as a little German town would be, but rather the opposite. The flatness is relieved only by the campaniles of the churches, churches with which the hill-sides are thick set. These supply many good specimens of the true type, tall, square, hard, with the coupled windows and midwall shafts, which all Western Europe once borrowed from Italy. And these smaller towers in the villages by the lake-side lead well up to the two nobler ones which form the chief architectural ornament of the city from which the lake takes its name. To the architectural student Como is certainly most attractive on account of a building which is not strictly part of the city itself, the minster of St. Abundio without its walls. Yet Como has a good deal to say for itself on other grounds. It is the city of the Plinies, as modern Como has not forgotten, for it carefully keeps, built into the wall of its cathedral church, a stone with an inscription preserving the name of its most renowned heathen inhabitant. We began with a reference to one novelist, and chance supplies us, at Como itself, with a reference to another. From a passage in *My Novel* it seems that Lord Lytton—we will not say thought, but allowed himself for a moment to write—that the elder Pliny died in the crater of Etna. The confusion is amusing; still, as things go, when two sages died of two volcanoes, it is perhaps a light matter to couple the wrong sage and the wrong volcano.

Deus immortalis habet,
Dum cepit Empedocles, ardentem frigidus Etnam
Insulat.

No such motive, we are sure, was present to the mind of the diligent compiler of the Natural History and loyal admirer of Vesuvius's fleet. Deity was not for him, but only for the master who, when he began to sicken as a man, said merrily that he felt himself beginning to be a god. Anyhow Como may well be proud both of the uncle who died among the ashes of Vesuvius, and of the nephew, somewhat of a prig as he was, to whom we owe the account of the Bithynian Christians and the first and most decent of the Panegyrics.

But it was hardly by producing either the elder or the younger Pliny that Como has had its chief share in influencing the destinies of mankind. For such a share it has had, though not in so direct a way as greater and more renowned cities. Twice in the history of Europe have the wrongs of Como or its citizens been counted among the causes or occasions of events which have turned the world upside down. One of the alleged grounds for the rebellion of the first Caesar was the scourging of a citizen of Como in despite of the patron to whom he owed his exemption from such treatment. And, twelve hundred years afterwards, not the stripes of a single man of Como, but the general wrongs which the whole commonwealth had suffered at the hands of Milan, were among the alleged grounds for the first great Italian expedition of a later Caesar. In those days

Civitas Ambrosii velut Troja stabat;

not in the new form in which she again arose by the help of Cremona and Brescia, but in the statelyness handed down from the old days when Milan was a seat of empire. In the eyes of the men of Como Milan, the centre of Lombard independence, was simply the local tyrant under whose yoke they were writhing; the German conqueror was to them their lawful sovereign and deliverer, the "dulcissimus Imperator," as yet more fortunate than Augustus, better than their own Pliny's own Trajan. And, as if expressly to make the parallel between Julius and Frederick yet more speaking, the fellow-sufferer of Como who prayed, like her, for deliverance by the hand of Frederick from the power of Milan, was the city which bore the name of the rival of Julius, Lodi, once *Laus Pompeii*. The city which rejoiced in the patronage of Caesar and the city which rejoiced in the patronage of Pompeius united to crave the help of the Emperor who, when in his later days he set forth on his last crusade, did not forget to proclaim himself as the avenger of Crassus and Antonius on the Parthian.

Como then, without having any great direct place in history,

has a considerable indirect place. The existing city itself has a character which is somewhat analogous to its historical position. It has no particular interest as a whole; there is nothing specially characteristic in its plan or its architecture; but it stands on a beautiful site, and it contains two or three buildings of some importance. Standing on the edge of its lake, encircled by mountains, with the castle-crowned peak of Baradello looking on it, like a vaster St. Michael's Tor on Avalon, when Avalon was an island, the general aspect of Como is altogether a taking one. But, if we walk through its streets, we shall find few Italian cities which have so little to show in the way of arcades or street architecture of any kind. Without comparing Como in this way to Bologna or Padua or Verona, there is really more of characteristic Italian domestic architecture hidden in the narrow streets of its small neighbour of Lugano. But some particular buildings deserve notice. At Como Church and State must have been on friendly terms. The home of the commonwealth joins hard to the synagogue; the *duomo* and the *broletto* make up a single range. The secular building is the more pleasing of the two. The tower is plain, one might say, rude; but the body of the building belongs to that momentary stage, early in the thirteenth century, when the use of the pointed arch was just beginning to creep into the Italian Romanesque, but when the distinguishing faults of the Italian Gothic had not yet begun to show themselves. The massive arcades have the arches slightly pointed; but there is no other departure from the true national forms of Italy; the grouped windows above are round. In the west front of the cathedral all the faults of the sham Gothic of Italy come out. The front itself is a sham; the doors and windows are there, because doors and windows are things which no building can do without; but, as usual in the Italian Gothic, they are simply cut through the wall, not worked into the design, as either in the Italian Romanesque or in the Northern Gothic. The lover of genuine mediæval art will at Como be most likely to say that the Renaissance choir, transepts, and cupola of the church are really better in their own way than the Gothic nave. Yet, after all, the Italian Gothic, as it is seen at Como, is not of the worst kind. It seems to have caught a little of the same spirit as the great *duomo* of Milan. The arches at least do not sprawl over the same frightful width as those at Florence and elsewhere. And we feel kindly towards the fourteenth- or fifteenth-century architect for preserving the two lions which now do duty for another purpose within, but which must have served in an earlier church to bear up, as at Ancona and St. Zeno, the columns of a mighty doorway in the true native style of Italy.

But, as everywhere in Italy, the true glory of Como is to be found in one of the earlier buildings reared in the genuine national style of the country, the style which all Western countries learned of her. The church of St. Fedele within the city, though sadly spoiled, keeps some good Romanesque portions, especially its apse. But this is a small matter compared with the great minster without the walls; for Como has no lack of walls and gates, though they cannot be called specially attractive. The St. Augustine's or St. Owen's of Como is the church of St. Abbondio. The eye is at once caught by the admirable grouping of its east end, a grouping German rather than Italian, an apse of extraordinary height and richness rising between two tall campaniles of the type which Germany borrowed from Italy. It shows the real identity of the older German and Italian styles, that the grouping of the towers at once suggested Germany. Had one of them stood detached, it would have simply passed as a fine example of the usual Italian type. But the great height of all this part of the church, quite unlike the wide, spreading apse so common both in Germany and Italy, and without the open gallery usual in both countries, gives St. Abbondio a character of its own, and one which contrasts a good deal with the rest of the building, where, in the outside view, width is the prevailing dimension. Double aisles, unmasked in any way, with a double clorestory, form a body as stately in its own way as the eastern part, and in the side height strongly predominates. Of the four ranges of piers, the central pair are tall columnar piers of masonry, something like those of our own Gloucester and Tewkesbury, but with a more distinct cushion capital. The southern range are tall monolith columns, lofty beyond any classical proportion, also with cushion capitals; but those which answer to them on the north side seem to be classical columns lengthened to the proportion that was needed, and filled with various capitals. An English eye of course misses the triforium or its equivalent of some kind between the arcade and the clerestory; but the whole interior is of singular dignity. The western gallery within, the signs of a western portico, destroyed or never added, without, are points to be noticed; indeed the church would well deserve a monograph. As to its present state, it has either been singularly fortunate in having escaped the destroying hands of Popes and Jesuits, or else it has been restored in a singularly conservative fashion. Something has plainly been done; but, to judge from the building itself, no mischief. Yet a pile of broken columns and fragments of sculpture of all kinds and dates lying about close to the church suggests natural suspicions. Some seem actually of Roman date, and indeed the lower part of the walls of the church itself appear to be made out of the massive stones of a Roman building. Be all this as it may, the minster of St. Abbondio is indeed a thing to see, an example of a kind of Italian Romanesque, not untouched by Northern influences, but quite free from the strange forms of St. Ambrose at Milan and St. Michael at Pavia.

On the whole, Como, though not at all a city of the first antiquarian rank, is one far from lacking in interest. And the slight

Northern tinge to be seen in the architecture of its chief monument does not seem out of place in a city where men must have so often sent up the strain of the loyal hymn—

Princeps terre principum, Caesar noster, ave,
Cujus jugum omnibus bonis est abave;
Et si quis recalcitret, putans illud grave,
Obstinati cordis est et cervicis prava.

LITERATURE AND COUNTRY COUSINS.

A VERY small literary reputation goes a long way with those who live in the country. To their eyes the man who has written and published a book is a being of another order. He belongs to a superior sphere. It matters little whether his book is successful or not. He has been in print. That is enough. He may have written the greatest trash ever composed; he may never have been able to make it known beyond his own immediate circle; he may have lost heavily by the publication; it does not signify in the least. Wherever you go in his district you hear of him. He is so well informed, you know; he wrote a volume of essays. Or, he has had several poems in the *Blankshire Gazette*. Or—and this is usually conveyed in a whisper—while the man goes by, "Do you know who that is? He is an author!" The literary man from town has probably seen too many authors to be much impressed by the fact, and is rather tired when he has heard the same thing said every time he happens to meet the same person. It comes to a head however when, after the exertion of a profound but useless strategy on his part to avoid an introduction, the unavoidable hour arrives when he is walked off by a bustling hostess, and the two are made acquainted with each other. Sometimes a man may be found who has the sense to be quite content with his local fame. But such men are rare. It seldom happens that the writer of a letter in the chief newspaper of his county town is satisfied till he has offered the editor a leader or two as well. Great as are the troubles of editors in London, they are at least spared the pain and danger of throwing a slight upon some county magnate who desires to see himself in print, and to refuse insertion to whose lucid remarks upon the labour question or the price of pigs is a serious risk. For one man content with local celebrity, half a dozen at least will take the opportunity of meeting the town author to ask his good offices with a London publisher, to get an opinion out of him as to their latest performance, or to inquire whether he thinks the general public prefer fiction to philosophy, as his new acquaintances are quite prepared with an unlimited supply of either.

The country reputation of London authors, on the other hand, is often an arbitrary and unaccountable thing. The man who writes a catchpenny romance under the name of history, or who is chiefly remarkable in literary circles for the unanimous chorus of ridicule with which his books have been received, goes into the country and finds himself famous. Every one knows his name. Adverse criticism, provided only it is universal enough, lifts him into notice. The only thing that can harm him is neglect. When he has visited his country cousins, you hear such wonderful things of his talents and urbanity that you determine to have another look at his books before finally condemning them. After you have lived, perhaps for years, in critical circles, you find it almost impossible to realize the existence of whole parishes, nay whole counties, full of people who never passed a literary opinion in their lives. They are quite satisfied to accept as undoubted the real greatness of a man so universally talked about. And so it comes to pass that a man is great in the homes of all England, out of London, for whom every literary man of any reputation in town entertains the profoundest contempt; and, again, that the real leaders of thought, the heads of parties in the republic of letters, the men to whom authors and publishers bow down, whose opinion is final, and whose judgment is late, are never heard of by name in the outer world, and are as unknown in the Midlands as in Central Africa.

It is often amusing to see the fuss made by a country cousin in London at the sight of a literary celebrity. You may think very little of the poet Smith, you may have reviled him monthly in the public press, you may have advised a publisher to have nothing to do with him—nay, you may have gone so far as to apply the word doggerel to his poetry—and you point him out to your country cousin with a contemptuous smile, and are simply startled at the interest his name evokes. On the other hand, suppose you happen to meet the great Jones, for whose opinions you have so deep a respect, and you are actually blushing with pleasure because he nods at you familiarly, you feel the greatest surprise, perhaps almost mortification, to find how impossible it is to explain to your companion who the lion is, or why you account him so great. There are many such men in London, and many too in the country, but they are often quite unknown in their own neighbourhood. They sometimes come to town, where they shine in certain circles, and retire again into obscurity. When some one who knows them comes down into their district, and speaks of them with deference as eminent, his language excites nothing but surprise. We may be pretty sure no one thought much of William Shakespeare when he lived at Stratford-on-Avon. John Newton was a far greater man at Olney than William Cowper. Richard Hooker was "only the parson" at Bishopscourt.

The London literary man need not go to his country cousins for rest. His visit is a matter of too much importance. If he wrote

in every newspaper and edited half a dozen magazines his reputation could not be more exaggerated by his relatives. He may not care for archaeology, but weeks beforehand plans are made for taking him to see a British earthwork or a Norman font. He may be wholly unacquainted with Greek, but the headmaster of the neighbouring college is invited on purpose to talk to him. He may be as little learned in theology as King Thackombau, but he will be expected to entertain the Archdeacon. Every difficult inscription on the church bells for miles round, every black-letter book, every versifier in the village school, will be brought to him. If he understands art his opinion will be asked, not only on the amateur performances of the young ladies, but on the old masters in the gallery at the Court. He must be prepared to pronounce upon the genuineness of a Constable as well as on the perspective of Miss Lucy's last sketch. He must know the marks on all porcelain and pottery, and have the date years of all silver assays at his finger ends. If he goes to church the curate, who can preach naturally and movingly enough to the old women, thinks it necessary to read, with blushes and stammers, an elaborate essay, and inwardly wishes he had never been born. He is carried off to visit the Miss Robinsons, "who are so very intellectual," though he would much prefer to stay and flirt with the Miss Browns, who are very pretty. If he would hear a tune, Beethoven is performed for him. If he expresses any enjoyment of music, he is expected to understand the mysteries of the redundant fifth, or to teach the school choir the construction of a fugue. He is thought modest if he refuses to profess omniscience, and perhaps a little stiff if he will not give an opinion on what he does not understand. He is amazed how far a small joke will go, and has to be guarded in his conversation, as everything he says is treasured up and repeated. If he happens to speak familiarly of a statesman or a novelist, a thrill runs through his audience, and the hostess gives her guests a look which says plainly, "I told you so." If he smiles, everybody else laughs. The smallest details of what is to him everyday life are listened to with eager interest. That a celebrated author should often say foolish things, or buy a new pair of gloves, or write with a quill pen; that a well-known artist should smoke while he paints and should be fond of children; that a famous poet should be best known among his intimates for funny stories; that a great preacher should be a good judge of prints, or should play on the fiddle; that an eminent musician should be fond of hunting—all these, and other things like them, are heard with wonder, and will form for years the staple table-talk of the neighbourhood.

So far there is something not unpleasant in his position. Few men there are who do not enjoy being made much of. A lifetime of this sort of thing would be very demoralizing, so he thinks, but a day or two of it is an agreeable and salutary excitement. He is nobody at home, and there cannot be a greater change of air and scene than to find himself somebody abroad. On the other hand, there are crumpled leaves in his bed of roses. Something has to be paid for the adulation he receives. He cannot enjoy himself for nothing. For the first few days he hugs himself in the happy delusion that he is meeting people without literary ambitions, and that he can look round the table and fancy that nobody present is an author. There is great relief from overwork in such a feeling, an absence of restraint, and a general relaxation, leading to that exhilaration of spirits which no doubt the country cousins look upon as his normal state. But a cruel awakening often ensues. Sooner or later comes the inevitable manuscript novel or, what is worse, the poem. Sooner or later he has to face the thought that, innocent and harmless as these bucolic folk have appeared, it is only for want of opportunity that they have not long ago rushed into print like anybody else. His dream of happiness is rudely interrupted. He has to meet the shock of finding that the lovely girl with whom he has been flirting so thoughtlessly, or the gentlemanly rector with whom he has had such merry talks, are full of guile, and would be authors if only he approved of their attempts. In the first case, he may be led by pity to do foolish things, to undertake the satisfaction of the fair charmer's little ambition, though he entail on himself the labour of rewriting every word she has written, and to put himself under an obligation to the publisher whom he most dislikes and has most persistently attacked. It is a serious question how far he can conscientiously do this. The rector's manuscript will be judged on its merits. In all human probability it will be very summarily dismissed to its previous retirement in the pigeon-holes of his desk. Not so with the young lady's. It is astonishing to think how much fiction, and worse, is yearly written by ignorant and inexperienced young ladies, and to reflect that the greater part of what finds its way into print has been composed in the country by writers wholly unacquainted with the most ordinary rules of composition. From four to six novels, each in three volumes, are published every week, and the majority will fall by their own weight and will never, after their first appearance, be heard of again. All these considerations, and more, rush through the brain of the literary man when that fatal moment arrives. Perhaps he is open, and, remembering his own sad experience, warns his fair friend that the paths of literature are difficult and thorny, and that success is only to be attained by labour to which the toil of the slave or the treadmill of the convict is mere play. More often he shirks the direct question; and if he hesitates at all he is lost. He will have to remove all obstacles and to help the manuscript into print himself, though by doing so he in reality neither benefits literature nor the young lady.

An unpleasant moment is that, too, when the album is brought

out, his photograph demanded, and his signature as well. Lucky is he if he escape so easily. It is more than likely that he will be expected to fill up a catechism as to the authors he reads and the colours he prefers. Every one has not the presence of mind to put down his own works in answer to the first question, or "piccad" to the second, and it is well for him if that is all. Some men have a capacity for writing little verses, and probably more than one celebrated rhymist has commenced life by album poetry. But albums are not so common now as they used to be, and the literary man in the country need not distress his mind by composing a ballad beforehand. If he can draw, it is more likely his talent will be put under requisition to ornament a page with grotesques, or to surround a likeness with appropriate emblems. He is in great request for charades, and is expected to be equal to any part. With books and play and a little healthful acting, his holidays are soon passed, and though he comes back to work with a consciousness of having enjoyed himself even more than he expected, he yet half unconsciously determines to take his next vacation among the Alps or in Transylvania.

RAILWAY POLICY.

THE strong and almost universal condemnation with which the proposal of the Midland Railway Company to assimilate first and second class passenger traffic was received naturally led to a rumour that the Directors had reconsidered their decision, and were disposed to modify it, if not to abandon it altogether. This report, however, was quickly contradicted. It was intimated in a semi-official manner that the Midland Directors intended to adhere strictly to their original scheme. Only it was explained that this scheme was something quite different from what it had been supposed to be. As the first announcement of the project was voluntarily made by the Directors themselves, it is strange that they did not endeavour to state distinctly what it was that they meant to do, and it is still more surprising that they should have allowed several weeks to elapse without attempting to correct the misapprehensions which are now said to have existed on the subject. At last, however, we have a letter from the Chairman which is intended to clear up all doubts. It appears that there are still to be three classes of carriages on the Midland, and that the first class is to be elevated instead of being abolished. Pullman's Sleeping Cars, or some other carriages of a similar kind, will supply a first-class accommodation superior to that which is now afforded; the present first-class carriages will be used for second-class passengers; and the third-class carriages will remain as before. Return tickets are not to be abolished, and there are to be no restrictions as to the date of the return journey.

The first question which arises is as to the new and "very superior" first class. We are told that the service of Pullman Palace and Sleeping Cars is to be "gradually extended." At present, we believe, the Pullman cars run only between St. Pancras and Bradford, and only once a day from each end—that is, at midnight from St. Pancras and in the afternoon from Bradford. This is obviously a very limited experiment, and the Midland Company would require to provide itself with a large addition of new and costly rolling-stock if first-class carriages of the improved kind are to form part of its regular trains. If these superior carriages are to be represented only by the single Pullman train they may as well, as far as ordinary traffic is concerned, be left out of account, and in that case the scheme returns to the form in which it was originally announced. There is, moreover, some ambiguity as to the fares which are to be charged for these superior first-class carriages. For some unaccountable reason a great mystery is made of the tariff of the Pullman cars—quite as great a mystery, in fact, as has been made about the new policy of the Midland itself. It is evident that the Directors are partial to an atmosphere of clouds. The time-table tells us that "First-class Passengers may avail themselves of the Drawing-Room and Sleeping Cars on payment of a small additional charge," but it is apparently thought to be dangerous to disclose the precise amount of the charge. "Further particulars may be obtained on application at any of the stations," and in the course of time we shall perhaps also be able to obtain "further particulars" as to what the Directors mean to do about their first-class traffic generally. We trust we are divulging nothing which will be injurious either to Mr. Pullman or the Midland Company when we mention that the charge for a berth in one of the sleeping cars is, we have heard, six shillings. This seems to be a very moderate price for a good night's rest; but, in the first place, we do not know whether the charge will remain at its present amount when the reduced first-class fares come into operation; and, in the second place, there are a great many people whom even the Oriental luxury of a Pullman sleeping-berth will not tempt to go to bed in the daytime, and the number of those who travel by night is of course comparatively small. The only thing then that appears to be certain is that the first class, as we know it at present, is to be abolished; the carriages will remain, but they will be crowded with a new class of people. Whether a sufficient number of superior first-class carriages of a new kind will ever be provided, and, if so, at what price, remains to be seen; but it is obvious that their construction must be a question of time, and the fares may possibly be high. It is suggested that those who desire privacy and ease can obtain a reserved compartment by the purchase of four first-class tickets. If this plan is generally adopted, the result will be of course that

the shortening of trains by packing into every carriage as many passengers as it can possibly be made to hold, which is represented as one of the economical advantages of the new system, will not be obtained, and the only result will be, that the charge for the sort of comfort which first-class passengers at present enjoy will be raised.

An appeal has been made by the chief Railway Companies to the Midland to postpone carrying out the proposed changes until after the half-yearly meetings, in order that the subject may be carefully considered, and it is probable that this will be agreed to. It has been observed that, if the Midland has made a mistake, there must be an inconsistency in the alarm of other Companies, since what is bad for the Midland may be supposed to be good for its rivals. The origin of this alarm must, however, be sought in the doubts as to the discretion of Railway Directors generally which have been produced by the conduct of those of the Midland Company, taken in conjunction with other symptoms of confusion and incapacity in the railway world. It is indeed painfully clear that at the present moment Railway Boards are altogether at sea in regard to any fixed principles for regulating their dealings with their customers. This is not the case of the Midland alone, though its fussy restlessness is for the moment particularly conspicuous. It is almost equally the case with every other Company, and hence the uneasiness and consternation with which this kind of property is just now regarded. It is evident that Directors cannot make up their minds as to the right course to be taken in fixing tolls and fares, and that, in sheer bewilderment and desperation, they are casting about, now in one direction and now in another, in the hope of discovering by experiment what logical reflection has failed to disclose to them. It might have been supposed that any child would be capable of foreseeing the necessary and inevitable consequences of giving largely increased facilities to third-class traffic without making any change in regard to other classes. Yet Boards of Directors are aghast at the persistent decline of second-class passengers which has followed as a matter of course. It is obviously impossible to touch any part of such an artificial system without disturbing the stability of the whole, and the only way of preventing this disturbance is by a readjustment of the original balance. It is amazing that even Railway Directors should have failed to perceive that when third-class carriages began to be attached to all, or almost all, trains, there would be an immediate diversion from the second class into the third of those who had previously travelled second class simply because there was no third class to go by. Second and third class carriages have hitherto been about on a level in point of comfort. There may be perhaps a little padding about the second class which is wanting in the third, but otherwise the size and style of the carriages are much the same. The amount of the fare is, in fact, the chief difference between them, and as this difference is on a long journey really considerable, the consequence has been that—setting aside the first-class passengers—only those who are rather sensitive as to the company in which they travel go by the second class. The utterly disproportionate excess of second-class over third-class fares is, in fact, a fine levied by the Railway Companies not for the use of a superior class of carriage, but for exemption from contact with the roughest class of the community. The result is that people who cannot afford to travel first class, and who shrink from the third, have to go second class at a cost which is absurdly high when measured by the miserable accommodation provided for them; and it follows very naturally that persons of this class avoid travelling as much as possible. It may be said that it will be a boon to this class to be allowed to travel in better carriages at the present fares, but the answer is that this is not what they want. Their grievance is not the homely plainness of the accommodation, but the absurdly disproportionate price which they have to pay for the privilege of merely being protected against the risks of third-class company. If it were not for the marked difference of cost, the bulk of middle-class people would probably all go second class, and the third class would be left to those who were content with it or could not possibly afford to pay more than the very lowest fare. There can be no doubt that the present high second-class fares tend to restrain the travelling of a large and important class of the community whom it would be the interest of the Railway Companies to conciliate.

The great difficulty of the Companies would seem to be to determine whether they should confine themselves to squeezing as much as possible out of people who must travel, and who have therefore no alternative but to pay whatever price is charged, or whether they should endeavour to encourage those to travel who are under no obligation to do so, and who require to be tempted by cheap fares and special conveniences. One can understand the various reasons which may be urged on one side and on the other, and we are quite ready to admit the right of the Companies to do the best they can for their own interests. Their error, however, has consisted in attempting to work two different and antagonistic lines of policy at the same time. The high ordinary fares are the only excuse for excursion trains, which not only derange and endanger the regular traffic, but drain the ordinary trains of a large class of people who at more moderate rates would certainly go by them rather than submit to the unsavoury crush and various irritating restrictions of an excursion. We are glad to see that in one point the Midland is setting a wise example, and that is in placing no restrictions on the date up to which return tickets may be used. Nothing can be more absurd than the plan of limiting return-tickets to two or three days, or a week, or perhaps a month. The time which is allowed to be spent at any place really costs the Company

nothing, but a liberal allowance in this respect is a very great inducement to travel. The reason of these restrictions is of course that the Companies are trying at one and the same time to make persons who are obliged to travel by their lines pay high rates, and to hold out the temptation of lower rates to people who travel only for their own pleasure. It is as if a butcher were to attempt to discriminate in his charges between people who are impelled by absolute hunger to seek a meal and those who want meat merely for the pleasure of eating it, and will not buy unless tempted by a moderate price. The number of people who have no choice but to travel, and to travel in a particular direction, is, after all, very limited. On the other hand, the number of people who have leisure and inclination to travel, if tempted to do so by the offer of comfortable accommodation and cheap fares, is practically unlimited. In trying to play a dodging game between these two classes, the Companies are simply upsetting themselves between two stools.

Another instance of the eccentric mismanagement of railway traffic is afforded by the way in which goods are dealt with. There are some kinds of heavy goods for which the Companies compete with each other in the most reckless manner, and which they will carry, rather than not have them at all, at absurdly low charges. Goods traffic, it must be remembered, is really much more troublesome than passenger traffic, for the obvious reason that it is inanimate. It cannot put itself into a train and take itself out again. It has to be carted, and carried, and loaded and unloaded, and perhaps housed for a time. Yet the passenger who requires no attentions of this kind, and asks merely to be allowed to sit in a carriage from one station to another, is charged, as compared with goods, out of all proportion to the trouble and expense involved in the journey. The excuse of the Companies would no doubt be that, unless they charged low rates for certain kinds of goods, they would not get the carrying of them, which is no doubt true; but why should it be supposed that moderate rates for passengers would not produce a similar result? There is, however, one class of goods traffic which appears to be systematically neglected by the Companies, and that is the small parcels traffic. Part of it has already been absorbed by the Post Office, and, if it pays the Post Office, it might, one would have thought, have paid the railways to take charge of it themselves. For things which cannot be sent through the post the system of conveyance which is adopted by the railways is simply prohibitory. The charges are excessive, but that is nothing to the utter uncertainty which attends the delivery of parcels. They may be days on a journey which should be performed in a few hours. It is a mere matter of chance. The booking-office takes the package, and some day or other it is supposed to turn up at its destination; when that will be, if ever, nobody can possibly tell. It may be suspected that parcels are left to manage themselves. In one instance that we happen to know of a parcel which had to be carried a distance of some twenty-five miles as the cross flies did not reach its destination for nearly a week. On the whole, it is evident that railway traffic is not cultivated in the same intelligent and rational way as other kinds of business, and the reason probably is that those who have the management of it have hitherto had their attention too much absorbed by other things. The day when Railway Directors will set themselves to work their lines in a steady, business-like spirit, endeavouring to meet the wants of their various customers, to cultivate traffic by offering terms that will tempt it to come, and to make travelling not only as cheap but as safe as possible, will be the beginning of a more hopeful period for railway property.

SOUTHERN NEW ZEALAND.

A COLONY which is just now spending borrowed money on its railways at the rate of a million and a half sterling in the year, and has run up a public debt of nearly thirteen millions, cannot fail to claim our attention. It is not here proposed to discuss the merits of this policy, but to place more clearly in view the distinctive characteristics of one main portion of New Zealand. That name may even yet, like those of other Australasian countries in the past, be deemed subject to revision. It is not long since we used to talk of New Holland and Van Diemen's Land. The latter now bears a worthier name; but it has been proved by Mr. Major, from early maps of the fifteenth century, that the mainland was known to the Portuguese long before it was visited by the Dutchman. Its eastern part, our New South Wales, was actually discovered by the English Captain Cook, and was soon afterwards colonized. The distant islands in the South Pacific Ocean were seen by Tasman in a cursory manner; but it is questionable whether a Spaniard had not seen them before, and it was Cook who first went round their shores. "New Zealand" is the most absurdly inappropriate name for them that could have been devised. It brings to mind the almost ludicrous contrast between those alluvial flats of the Scheldt and the bold configuration of lands formed by huge volcanic and glacial forces, and isolated by the disruption or subsidence of a vast continent, in the widest open space on the globe. To carry on the joke, when our countrymen began to deal officially with those islands, somebody had the Irish fancy to call them New Ulster, New Munster, and New Leinster. The native words, which we need not try to write, could never be pronounced or remembered; but designations were to be contrived for the entire

group, and for the several islands, two large and one small. It was attempted to distinguish them as the North, the Middle, and the South Island; but this, too, has failed in practice. The most southerly isle, which is uninhabited and of insignificant size, keeps the name of Stewart, a sailor whose exploits are but too notorious; and the Middle Island has therefore been recognized as the South Island, which it substantially is. The true dualism of New Zealand, natural as well as social, is the subject of our present remarks.

The striking difference, in most natural aspects, between the North Island and the Southern part of New Zealand must necessarily affect their industrial and social conditions. It will not tend to political separation; but the self-sufficingness of New Zealand as a whole, and her independence of the Australian provinces a thousand miles away, will rather be confirmed by her development of such diverse internal resources. Some modification, indeed, is at this moment under discussion in the political relations of her Northern provinces. The latest project of Mr. Vogel, a Premier with a turn for audacious innovation whom his admirers regard as a colonial Bismarck or Cavour, is to merge those four provinces in that of metropolitan Wellington. This will probably be resisted by Auckland, the older and more populous former seat of general government, resenting still the loss of that profit from official expenditure which was never larger than during a Maori war. Such competition for government patronage is too apt to distract the infantile public mind of new and small communities from objects of more enduring value. It was curious in 1852 to observe how these local interests determined the views of colonists as to the representative constitution then bestowed. Auckland was naturally afraid of being supplanted by Wellington, on account of its more central situation on Cook's Strait between the two equal islands. It was therefore preferred by Auckland that the two islands should form two perfectly independent colonies. Wellington and Nelson, on the contrary—the settlements planted by Wakefield's New Zealand Company on opposite shores of Cook's Strait—asked for a central government of both islands, with municipalities at the several townships or settlements. These were two hundred miles apart, with communications by a wretched sailing-vessel or a pathless ride across mountain and forest. But each of them had the soul of a rising commonwealth. It was not municipal institutions that could satisfy the ambitious foresight of Canterbury and Otago Pilgrim Fathers. Their three or four years' actual experience had indeed failed to prove that their well-meaning parent Associations for realizing certain principles of ecclesiastical and social union could pay their way. Yet there was no thought of abandoning those two settlements and the large investments in the purchase of territories comprising nearly all the eastern side of the South Island. Their inhabitants of 1852, though not exceeding 4,500 in Canterbury and 2,000 in Otago, demanded provincial self-government, and obtained it from the Imperial Legislature. It was displeasing, of course, both to Auckland and to Wellington. The existing federal constitution allows to each of the nine Provincial Councils and Superintendents nearly as much power as is enjoyed by the State Governments of the American Union. Indeed the New Zealand provinces have more; for each disposes of its own waste lands for its own profit. Whatever may be the faults of this system, events have amply warranted the claims of Otago and Canterbury, then somewhat derided, to a voice in framing the constitution. Those provinces, created but twenty-five years ago, have far outgrown that of Auckland in every element of prosperity. The aggregate population of the South Island in March last amounted to 186,855, of whom only some hundreds were of the Maori race. That of the North Island was 112,251, including nearly 30,000 natives, about half of these being at least half civilized. The total European population of New Zealand has increased above tenfold in twenty years.

Scientific men have often remarked the contrasted physical features of the two large islands. Passing through Cook's Strait, to the north is a country of low swelling hill-ranges or tablelands, broken by isolated volcanic peaks. This land is covered with luxuriant forests, except in a central region of lakes and hot springs or geysers depositing silica and sulphur beds, like that of the Yellowstone in North America. The climate at its north end has a languid semi-tropical warmth. To the south is a very different country. From end to end along its western side this island presents a continuous backbone of massive Alpine mountains, ranging from 11,000 ft. to 13,200 ft. in height, with a dense forest hanging in gloom upon their seaward slopes, beneath the eternal snows. But on the other side, facing eastward, this range displays vast snow-fields and glaciers, and immense beds of loose shattered rock, with clefts and gorges of terrible depth, whence the icy rivers are poured out into the lakes of an upland plain. The lofty plateau which occupies the middle breadth of the South Island is buttressed on its eastern side by a lower parallel range of mountains, through frequent breaks in which its rivers descend, and cross many successive terraces or steps to the eastern sea-coast. The nether terraces, from an elevation of 1,500 ft. downwards, and the strip of low-lying shore intersected by those variable rivers, compose what are called the Canterbury Plains. That province is divided from Otago, its southern neighbour, by the larger Waitaki river, flowing out of three lakes at the feet of the central mountains. In the contour of its shores this island is also very remarkable. Its south-western extremity is, by glacier action no doubt, indented with deep fjords like those of Norway. The north-eastern shore, in Cook's Strait, is wonderfully pierced and

contorted, forming a maze of inlets; but the east coast is an unbroken low beach of shingle, saving two exceptional instances. These are the two harbours of Port Lyttelton and Port Chalmers, the sea-doors respectively of Christchurch and Dunedin. They owe their existence to peninsular blocks of volcanic formation enclosing small pieces of water.

Such is the natural structure of Southern New Zealand. It is evidently so laid out that the Canterbury and Otago territories share between them most of the agricultural and pastoral opportunities, with their habitable and fertile eastward plains open to the two convenient seaports. The two northern provinces, indeed, Nelson and Marlborough, possess their own advantages. The former has thick beds of good coal, as well as some gold, copper, and iron; the latter, in its Wairau district, has the richest soil. But for the growth of wheat, meat, and wool, upon which in the first instance the wealth of a new country mainly depends, the middle and southern parts of this island combine all favouring conditions. Their climate, less mild and tranquil than that of sheltered Nelson, is better suited than any other in the world both to the cattle and to the cultivated plants of Britain, as well as to the health of our people and their children. It is like the best English climate kept dry and ever clear of fog, with much less winter frost. Seasonable airs of wholesome cold are inhaled from the inland snowy heights, or wafted from the Antarctic icebergs. Only an incessant windiness is complained of, but that serves to purify the air and to brace the nerves. Every vegetable product or domestic animal of our rearing there grows and multiplies with amazing quickness and equal vigour. The soil is good, though somewhat light, and responds to manure, it is said, in a manner that seems miraculous. There are no swamps and no forests in those broad plains east of the Alpine range. The farmers and the graziers of Timaru and Oamaru are *fortunati nimium*, who would know their happy lot if they could, for any wages, get the labour they want, together with easier access to a market. But these are boons which the railways and steamships are likely soon to give them. Three million acres in the Canterbury plains are fit for the agriculturist, the sheep-breeder, or the stock-owner, besides the extensive highland and mountain runs. Otago, including Southland, can show nearly as much open land, with a soil even better for wheat. From thirty-five to fifty-five bushels an acre is obtained in the most southern district. The merino sheep imported from Australia grows much bigger; his fleece here weighs, instead of two pounds and a half, three and a half; the wool, though not so fine, is softer, with longer staple. New Zealand sheep-feeding obtains a greater advantage, as the coarse native grass, and the rude squatting management of vast open runs, are superseded by laying down succulent English grasses in the fenced meadows of purchased estates. The yearly produce of the colony exceeds three million bushels of wheat and forty million pounds of wool, chiefly from the two great southern provinces. Canterbury already counts her three millions of sheep, Otago her four millions, with myriads of oxen, horses, and swine. The mineral riches, too, of this southern island are great, though surpassed by Auckland in the north. The Otago gold-fields have, indeed, since 1866 shown a decreasing yield; but these, together with those of Hokitika or Westland, lately part of Canterbury, and with those of Nelson, still yield gold to the annual value of 1,600,000*l.* Manufactures are promised and even commenced in the towns.

With these various and copious sources of public wealth, and with rapid sales of Government lands at 1*l.* and 2*l.* the acre, means were early found by the enterprising Provincial Councils to begin the construction of railways. Cut boldly through the rocky mountain that guards Port Lyttelton, a tunnel has opened the sea-door to the city of Christchurch close behind. The locomotive now travels sixty miles southward over the Canterbury plains. It will in the year after next, or not much later, pass on down to Timaru, and perhaps meet the up train from Dunedin. The last-named capital has 18,000 inhabitants, while Christchurch has 10,000; but they will probably by the end of the nineteenth century be equal to the present Melbourne and Sydney. The population of Canterbury Province is 60,000, and that of Otago is 85,000.

It is worth while to notice the steady and substantial progress of this southern country since the New Zealand Constitution was granted twenty-two years ago. Its founders, Scotch and English alike, failed in those days to realize their ideas of colonization under Church patronage. But they can now see in thriving adolescence the lusty young Scotland and England which they begot in 1848 and 1850. Lord Lyttelton when he visited the antipodes must have found in the sight of Canterbury Province a compensation for his past trouble in its first settlement. There is nowhere in the Queen's dominions a community that preserves so faithfully the genuine characteristics of English middle-class society. It has had no admixture either of an Irish or a German immigration, nor has it, like Otago, been invaded by the Australian diggers. To any well-bred English family of small fortune seeking a new home beyond the seas, that remotest colonial shore, if go they must, offers probably the most congenial abode.

"JEAMES" AT BIRMINGHAM.

IT is a curious circumstance that the greatest wonders always happen in a very dull season—at least if we believe the newspapers. The reason of this is perhaps that what would be looked

upon as a very ordinary and commonplace incident at any other time is magnified into something wonderful in order to make up for the general dearth of topics of interest. News nowadays is thought to be no news at all unless it is startling and sensational, and if sensations will not happen of themselves they must be manufactured. The man-and-dog fight is the natural development of the enormous gooseberry of other days. Modern journalists appear to be chiefly occupied, like Katterfelto with his hair on end, "at their own wonders wondering for their bread." A few days ago the Prince and Princess of Wales, when on a visit to a country house in the neighbourhood of Birmingham, drove into the town. Their coming had been duly notified, and of course Birmingham did its best to show the gratification it derived from the sight of its distinguished guests. The Prince and Princess had a kindly and courteous reception, just as they would be sure to have in any town in the kingdom. Yet this simple incident is written about in some of the newspapers as if it were the most wonderful and amazing thing that could possibly occur. The reporter of the *Times*, for example, can hardly contain his bewilderment and delight at the idea of a Mayor of Birmingham, and a Radical Mayor, too, actually behaving himself in a "gentlemanly" manner, and being able to make a civil and grammatical speech in the presence of a Prince. He notes also with equal astonishment that, though the crowd did not cheer quite so much as other crowds, and many forgot to take off their hats, the people were really orderly and well behaved. Indeed Jeames is so surprised and thankful that there was no rioting or flinging of rotten eggs that he is quite willing to make allowance for every deficiency in the way of huzzas and waving of hats and handkerchiefs. We get the idea that the absence of any violent breach of the peace was really more than he had hoped for. The reporter had perhaps had his imagination too much excited by the recent mysterious story of a remarkable encounter at Hanley, and the discovery that the people of Birmingham were not utter savages came upon him with a shock. The delicate and sensitive creature had apparently never ventured into this barbarous region before, and no doubt it was with some trepidation that on this eventful day he mounted the steps behind the carriage. Birmingham, it seems, "does not lie much in the track of Royalty" or of the flunkies in its train. Such a wonderful discovery as this, that anything "gentlemanly" was to be found in such a low Radical place as Birmingham, was of course too good to be hastily let drop. So next day one of the leader-writers of the *Times* is turned on to get some more wonderment out of it. At this time of year the weather is usually damp and foggy, but of course a Prince's visit is an infallible specific against this dismal atmosphere. Accordingly last Tuesday was "one of those rare days when not man alone, but all nature with him—the trees and plants, the birds of the air and the beasts of the field—were tempted to dream that the order of the seasons is about to be reversed." It seems indeed that for this day at least the order of the seasons was reversed, for the weather, as soon as it was known that the Prince was coming, "instead of sinking into winter, turned back to spring." Some day, perhaps, a careful study of the influence of Princes on the weather will form an important contribution to meteorological science. Not only, however, inanimate nature, but humanity itself, was brightened and refined under the beams of Royalty. The Mayor was known to have publicly avowed strong Republican views, which it was supposed he had not recanted; and there was therefore, we are told, eager curiosity to observe the manner in which a Republican Mayor would receive the Heir of the Monarchy. Would the Mayor strike out with his left, or would he disguise his feelings and take the opportunity of dropping something into the Prince's soup? Would he sacrifice his conscientious principles so far as to give the Prince his titles, or would he adopt the simple address used by Artemus Ward and call him "Edward"? It is easy to conceive the awful anxiety and agitation of the moment, especially as the various speculations as to what the Mayor would do naturally involved other speculations as to how the Prince would bear himself in return. It is with intense relief that the writer in the *Times* is able to announce that there was nothing outrageous in the behaviour of the Republican Mayor, and that an unseemly scuffle was happily avoided. In fact the interview is represented as having had the happiest influence on the Mayor, who, it seems, acquired self-respect, in which he had previously been deficient, and a "greater elevation of style." A hope is added that this influence may be lasting.

We do not know how it may strike other people, but it seems to us that this sort of way of speaking of the Mayor and people of Birmingham is not only very silly but extremely impertinent. What happened at Birmingham was exactly what any reasonable person might have known beforehand would be certain to happen. The *Times* remarks that this reception of the Prince and Princess of Wales will embarrass "those foreign critics who are for ever detecting among us movements which we ourselves have failed to discern," by which we suppose is meant movements hostile to the continuance of the Monarchy; but we should imagine that the innocent wonder which the *Times* itself expresses that everything went off quietly and peaceably is rather calculated to confirm than to remove these erroneous impressions. Foreign critics might very reasonably reply, "If the attachment of the people to the Throne is as firm and steadfast as you say, why do you exhibit so much surprise and exultation at the very simple and natural fact that the Heir Apparent should be received with the common civilities usual on such an occasion?" It is probable that Mr. Chamberlain still retains the opinions which he expressed a short time since as to the best form of government; but it must be assumed that before he undertook the office of

Mayor he must have satisfied himself that there was nothing in his political convictions to prevent him from discharging the duties of that position; and one of these duties was of course that of representing the town on any occasion when an address had to be presented to any member of the Royal Family. Everybody will agree that Mr. Chamberlain's speeches were just what they should have been, but it is only reasonable to suppose that this was due to his own sense of propriety, and not to any sudden and magical exaltation of his moral nature under the influence of the Royal presence. It is equally an insult to the inhabitants of Birmingham to suppose that they were in any danger of forgetting their manners on such an occasion, and to express astonishment that they should be actually civil and good-natured. There can be no doubt that they enjoyed the rare sight, not only of the Prince and Princess, but of their decorated town, and that they were perfectly sincere and cordial in the good-will with which they welcomed their visitors; but it is childish to represent this natural politeness as a formal repudiation of democratic opinions which some of them may have previously entertained, or to speak of their interest in the sight of a young gentleman who had just come from shooting a great lot of pheasants on one estate, and was going to shoot a lot more somewhere else, as "a confession of aspirations for a higher standard of existence." It is a very good thing that the people and their Prince should be personally brought together on a pleasant holiday, and that the swift passage of Royalty should break the monotony of everyday life by a flash of colour and gaiety; but it is scarcely judicious to twist simple and natural events out of their genuine character in order to invest them with a factitious importance. There is really no reason to suppose that, though political agitators occasionally speak wildly at Birmingham and elsewhere, there is any settled conviction in any part of the community in favour of a Republican form of government; but assuming that such views did prevail, it would be absurd to expect that they would be instantly and permanently suppressed by a hasty glimpse of the Prince and Princess. It is more comfortable to have the assurance that such feelings do not exist than to have to trust to their removal by such inadequate means.

Those who have the strongest faith in a Monarchy believe that it is an entirely rational institution, resting on a foundation of common sense, and corresponding to the requirements of human nature, and that it will bear to be looked into in a sober, practical way. The dangers which it has most to fear are not the assaults of enemies, but the foolish adulation of sycophantish admirers. There is scarcely any way in which it is possible to make Royalty look more ridiculous than by attributing to it the sort of pretensions of which we have heard so much within the last few days. The old superstition of the healing touch of the King may perhaps be recognized as a "survival" in the suggestion that a visit from a Prince exercises an instantaneous and elevating moral influence on all those with whom he is placed in contact. The Prince is of course a representative person, and it was only natural that the Mayor of Birmingham should endeavour to receive him with the respect and ceremony due to his position. It would perhaps be awkward for royal persons if their personal merits were invariably to be measured by the degree of "elevation" which is displayed in the formal addresses which are showered upon them through life. Whatever may be the speculative opinions of any persons in Birmingham as to the ideal of a perfect Constitution, the Prince of Wales's visit would certainly not have been a suitable occasion for their expression, and there can be no reason to be in the least surprised that his reception should have been marked by good taste and good feeling. Indeed, without exaggerating the importance of such events, it might be wished that they were less rare. If, as the *Times* remarks, Birmingham does not lie in the track of Royalty, that is perhaps not exactly the fault of Birmingham. It could hardly fail to be of advantage to the Prince himself if he were in his wanderings to include some of the chief towns as well as the great preserves.

FLOGGING.

THE remarkable document which occupied two columns of the biggest type of last Tuesday's *Daily Telegraph* may be worth a passing notice, not indeed for the sake of its arguments, if such they can be called, but as a fair sample of the sort of pleas put forward for the continued impunity of the kicking interest. No clue to the authorship is afforded by the mysterious signature of "X," but we may venture to observe that the writer has at least reproduced with admirable fidelity the style of flowing eloquence with which we have long been familiar in the leaders and "Own Correspondents" of that enterprising journal. The epithet "flowing" is in this case peculiarly appropriate, for the letter opens with an elaborate comparison between public opinion and the "flux and reflux" of the ocean, which however is rather complicated by the expression of a desire that, as time goes on—or, as the writer grandly phrases it, "at the determination of epoch after epoch"—we may find "that the river has become purified, and thus fertilizes in lieu of polluting the shores through which it passes." There is not usually any flux and reflux in rivers, and, though Homer does speak of an ocean stream bounding on all sides the habitable earth, there is something alike novel and alarming in the notion of the sea "passing through," instead of being content to beat against the shore. Such an event has before now happened in Holland, when the dykes have given way,

but the result, whether fertilizing or polluting, has been accounted very disastrous. But this is a mere preliminary detail; the real business of the writer, as he hastens to inform us, "is to note"—which here means to censure—"a very remarkable revulsion of public thought in favour of the infliction, for certain offences, of one of the most degrading, the most cruel, and the most barbarous of human punishments—that of the Lash." The classes guilty of the offences in question are what may be termed the kicking classes, and it is for them only, as will appear presently, that the punishment is too cruel and degrading to be tolerated. And it is so in their case because it exposes the sufferer to "flagrant and indelible infamy"; the scars on his back may perhaps be obliterated by time, but "the cicatrices on his name"—why does a scar become a "cicatrix" when transferred from the back to the name?—can never be removed. The branded man may meet with contemptuous pity from his associates, or "they may tacitly agree never to mention in his presence the shameful chastisement he has undergone"; and, considering the delicate refinement and exquisite tact of "certain classes," they would no doubt instinctively conform to this simple rule of courtesy. But still the merest accident may at any moment reveal the terrible secret, and then a more lusty word may provoke the taunt; "You talk; why you had forty lashes in the county goal for kicking your wife. You're not fit for the company of decent men. Yah! who's had the cat on his bare back?" And the writer goes on to explain to us at length, from his "intimate knowledge of the History of Penalty in all ages and all countries," that it is a great mistake to suppose that "their mates" will think no worse of these brave fellows for having been whipped. But he quietly, and no doubt quite correctly, assumes that they will think no worse of them for having kicked their wives, perhaps within an inch of their lives, which led to the whipping. And, to say the truth, he does not seem to think much the worse of them for it himself. He refuses expressly to admit that there is anything "shameful" in their conduct.

There is one class of offences however for which the writer considers this barbarous and degrading punishment very suitable. He first calls it felony, but, feeling perhaps the awkwardness of so vague and comprehensive a designation, more precisely defines the unpardonable crime as thieving. As to the sinfulness of theft there is no room for what theologians call "invincible ignorance," and this accordingly "is in itself a shameful crime." But with acts of brutal violence it is very different; there need be nothing at all shameful in them. "The greatest rough that ever beat or kicked his wife knows that it is a disgraceful thing to steal so much as a halfpenny that does not belong to him; but Christianity and Education have not yet so far reached him as to teach him that it is a shameful act to get drunk, and a more shameful one to maltreat a woman." Christianity and education apparently teach the Deenlogue backwards, and do not usually get more than half way through the second table. The "most ruffianly, dissolute, worthless, wicked 'coster-jads" of seventeen and upwards are always perfectly acquainted with the obligations of the eighth and tenth commandments—whether of the seventh also deponent saith not—but they are honestly ignorant of the sixth. For it may be presumed that even "the greatest rough," if he recognized the heinousness of murder, would be at least partially aware of the dangerous culpability of executing a *pas sent* in iron clags on his wife's head, or whiling away a leisure afternoon by kicking out the eyes of an old man of eighty and pouring lime into the sockets. But he is in fact wholly unaware of it; "this biting, kicking savage may be [and we are clearly meant to infer generally is] a perfectly honest, laborious, and honourable fellow." Well, as to that, we have heard of honour among thieves, to whom this writer allows none, and there may, for aught we know, be some code of honour understood by themselves among biting, kicking savages, but it can hardly be a principle which the law is called upon to respect. We are not going to discuss with the *Telegraph* Correspondent at exactly what age men or boys—or, to use his own classical phraseology, "any adolescent or adult"—may be assumed to have mastered the relative obligations of the moral law. But we have a decided conviction that those interesting young gentlemen "between the ages of seventeen and twenty-three," who are so profoundly sensible of the criminality and shamefulness of stealing, are not less distinctly aware that to stop an inoffensive artisan in the street, knock him down for refusing to give you sixpence, and then dance upon his body till he is crushed to a jelly—as three honest and honourable fellows did at Liverpool the other day—is equally shameful and criminal. We also quite agree with "the tide of public opinion," and disagree with the *Telegraph* writer, in holding that the brute who perpetrates this sort of abomination is also a coward, and deserves a coward's punishment. Whether or not his mates choose to inflict "cicatrices on his name" matters exceedingly little, but it matters much that scars should be inflicted on his back, for it is the physical and not the moral cicatrix that such brutes really care about. And, *pace* the *Telegraph* Correspondent and his intimate familiarity with the History of Penalty, all trustworthy testimony conspires to prove that they do care a very great deal about it, and care for very little else. The Assistant Judge expressed a strong opinion to that effect the other day in charging the Middlesex Grand Jury, and a whole chorus of judges, magistrates, coroners, and others concerned have borne similar witness of late. They do not seem to share the *Telegraph* writer's nervous dread of "spoiling a Man" by flogging him, and are perhaps more keenly alive to the

"spoiling" which the noble savage who is to be flogged has already inflicted on the old men, women, or children whom he has selected as the *corpus vile* for his playful and muscular exploits. To ask why, if a man who nearly kicks a woman to death is to be flogged, you do not propose to flog him before hanging him, if he quite kicks her to death, is too childish a question to need any reply. Nor is it much more to the purpose to hint at drunkenness as an excuse. In the first place it is not an excuse, and in the next place it is not a fact. In nine cases out of ten these ruffians are quite sober enough to know well what they are about; and if there are some of them who cannot be taught to keep their hands—we mean their feet—off their wives' heads without being taught sobriety, it is high time that both lessons should be inculcated on them in the sharpest and most effectual manner.

There is indeed something very peculiar in the *Telegraph* Correspondent's theory, both of crime and of punishment. We have seen that he considers theft to be always essentially and consciously "infamous," while brutal ruffianism, such as has disgraced all parts of the country for several months past, is quite consistent with the character of a brave, honest, and "honourable" man. The circumstance that a man may conceivably steal because he is starving, or has a starving wife and children at home, while no possible benefit can accrue to any one from kicking his wife's eyes out, appears never to have occurred to him. But, further, he announces his absolute disbelief, based on the "History of Penalty," in the deterrent effect of "cruel and infamous punishments," like flogging, on anybody. This, if it were true, instead of being demonstrably the reverse, would supply a very cogent argument against flogging altogether; yet the writer is strongly in favour of flogging thieves, and as garotters, although coming as such under the violent or "honourable" class of offenders, rob as well as assault their victims, he is willing they should be flogged also, and this in spite of his amazing assertion that flogging has not put down garotting, because some half-dozen garotters are still flogged in the course of the year. It is not as a deterrent but as "a vindictive punishment" that he would have thieves and garotters flogged, "and the more soundly the better." And not these only. "Let him (the garotter) by all means be triced up and subjected to the most vigorous application of the cat-of-nine-tails. I have no sympathy with him. I hate him; and I should very much like to see writhing and howling by his side the habitual swindler, the cardsharp, the pickpocket, the housebreaker, the writer of threatening letters, and the extortionate moneylender. All these are clearly infamous offenders and deserve infamous chastisement . . . when we whip a common thief or an habitual swindler, we do not run much risk of spoiling a Man." It is clearly therefore from no "maudlin sentimentalism"—to use his own words—nor even chiefly from distrust of its deterrent effects, that the writer deprecates applying the lash to the fine manly fellows who have invented this new torture of the boot, for it is equally inoperative as a deterrent in other cases also. It is because he has no sympathy with those guilty of garotting and cardsharpping, which are "shameful" crimes, and show "the depravity of heart" of the offender; while "the brutish miner, or quarryman, or navvy, or bricklayer's labourer who beats his wife," or nearly kicks her brains out, is innocently unconscious of anything "shameful" in so natural and exhilarating a procedure, being after all an "honourable fellow," who deserves the sympathy of the wise and good, and emphatically—with a capital letter—"a Man." If there were any truth in this singular estimate of human nature, it would be a strong additional reason for trying whether the surgical operation to which the writer objects so strongly might not succeed in implanting in the breast of the noble savage some germ of those salutary principles which "Christianity and education" have so deplorably failed to teach. If it be really true that, while "a footpad is a detestable rogue," we ought to regard "offenders guilty only of violent assaults" on inoffensive women and old men too feeble to defend themselves as "all honourable men," it is surely time that they should be taught to add to virtue knowledge, and to knowledge temperance, and to temperance brotherly kindness. A Judge declared the other day from the bench, with more than questionable discretion, that this kind of brutality could only be cured by education. But education is a comprehensive process, and has been largely carried on in former days by the aid of the birch-rod. Gideon is said to have "taught the men of Succoth with thorns of the wilderness and briers," and the teaching appears to have been effectual. That is the sort of education best adapted to the wife-kicking section of the community, and most likely to benefit their own minds and the bodies of their victims.

THE WINTER EXHIBITIONS.

THE mediocrity and monotony which usually afflict exhibitions at this dull season of the year have found relief in a startling composition which is remarkable for its size no less than for its mastery. "Venice doing Homage to Catarina Cornaro," by Herr Makart, is a canvas thirty-five feet in length, thirteen feet in height, and containing more than forty figures mostly above life size. The small French Gallery in Pall Mall, specially suited to cabinet works, can only find cabined space for this prodigy by the entire surrender of its largest wall. The picture we saw a year ago when it made its *début* in the *Künstlerhaus* in Vienna; thence it passed to Düsseldorf, and on the close of the present exhibition it will make its way to Paris. Its defects are patent,

yet within the last decade few nobler works have seen the light. The story which the painter recounts with the utmost pomp of state and splendour of colour runs as follows:—Catarina, the daughter of Marco Cornaro, had won universal admiration by her youth, beauty, and accomplishments, when, towards the end of the fifteenth century, the King of Cyprus came to Venice in search of a wife. At once the choice fell upon Catarina, whereupon the Council declared her a daughter of St. Mark, gave her one hundred thousand ducats as a dowry, and promised to protect her future home in Cyprus against the attacks of the Saracens. Before her departure a festival was given in her honour, and, according to the description printed in Vienna and now repeated in London, the picture before us represents what then took place. But, strange to say, uncertainty hangs over the artist's intention. It is narrated that Catarina lost her husband and returned to Venice in three years with an infant son, whereupon she was again fêted. The child in the picture, apparently her son, would indicate that it is the later festivities which are here celebrated. Nothing is omitted that can add splendour to the scene. Catarina is enthroned after the manner of "Venice Enthroned," by Paul Veronese; women throw themselves on their knees, girls come laden with flowers, merchants offer treasures, and the whole composition is forced up to the highest pitch by the banners, trappings, and embroidered draperies in which the Queen of the Adriatic robed and enriched herself in her days of pomp and pride. The treatment, no doubt, is consonant with the occasion, and yet we cannot but feel that the decoration is a little overdone.

At a glance it will be seen that Herr Makart is a product of the Munich school, not of its spiritual phase under Overbeck and Hess, not of its muscular development under Cornelius, not of its academic and pseudo-classic manifestation under the late Director Kaulbach, but of its more recent realistic and romantic complexion under the sway of Professor Piloty. A leading principle in this last school is that the historic painter must choose a noble theme which shall lend itself aptly to pictorial treatment, and then that, by studied lines of composition, beauty of form, richness of colour, effective chiaroscuro, and realistic texture, the import of the scene shall be enhanced to the uttermost. Herr Makart differs from his fellow-students, Herr Liezenmeyer, Herr Wagner, and Herr Max, who figure conspicuously in the exhibitions of Munich and other German capitals; by having surrendered himself to the Venetian school, especially as impersonated by Paul Veronese. Thus the *chef-d'œuvre* before us scarcely escapes plagiarism. The composition is little else than a compilation from well-known works by Veronese; the system of glazings, especially of red on white, and then the loading on heavily of lights, are literally Venetian. The handling is also strong in rotary swing at the wrist, and certain abrasions on the surface reveal a red ground priming on the canvas. It is unfortunate that the picture just fails of unqualified success; in fact, some parts break down egregiously; for instance, a big dog conspicuous in the foreground, which Velazquez would have made grand, is here reduced to the ridiculous. The painter is too confident, too negligent, and he cares little more for drawing or completeness than a stage decorator; all is sacrificed to effect, bought at the lowest cost. Thus he misses the high position which his great power promised. And yet Herr Makart stands as the most brilliant representative of the old Venetian masters; and when we entered his studio we found it hung with tapestries, furnished with antique cabinets, and otherwise adorned, as if this modern German had inherited tastes, fortunes, and properties from Titian, Veronese, or Tintoret. As a matter of course this monster picture throws into insignificance a total of 143 canvases distributed over the three remaining walls. The masters here dwarfed—Herr Kaulbach the younger, Herr Braith, M. Bouguereau, Mr. Burgess, Mr. Holl, and others—we have noticed before, and we may hope soon to meet them again in the spring gathering within this Gallery.

Mr. McLean once more invites visitors to a well-selected roomful of drawings. There is little to call for remark; indeed the masters, and even the subjects, are so well known that the Catalogue may almost be dispensed with. But some curiosity still attaches to an occasional stray figure by such eccentric geniuses as Signor Fortuny, Signor Madrazo, and others of their kind in Madrid, Rome, or Naples. This year we miss M. Zichy of St. Petersburg, also unbridled in passion and ungoverned in fling of pencil.

Fifty showy sketches by Mr. Halswelle are now on view in Waterloo Place under the title of "Twelve Months in Venice." The artist is almost too candid in his "Introduction"; he tells us that the series "is the result of the accident of a damp studio." It would appear that, in order to save his life, he betook himself to a gondola, whence he made what he is pleased to call "realistic and faithful delineations of everyday effects in Venice." This painter's garish talent we have found occasion to criticize from time to time in the Royal Academy. Mr. Halswelle is evidently a victim to the proverbial "unconsciousness of genius" when he assures us that he has worked "without any attempt to make pictures." All indifferent spectators must come to the reverse conclusion; scenes well known and well nigh worn out are here obviously dressed up with an eye to decorative effect.

The Winter Exhibition of the Dudley Gallery, which is reserved exclusively for oil pictures, has always been inferior to the Spring Exhibition, which is set apart to water-colour drawings. Still the present collection, like its predecessors, contains, among a multitude of works that ought never to have been perpetrated, some few products worthy of remembrance by reason of their high poetic

conception, pretty play of fancy, or well-wrought technique. Conspicuously placed at the head of the Gallery are three imperfectly embodied ideas, severally due to Mr. Watts, R.A., Mr. Poynter, A.R.A., and Mr. Stanhope—artists who are generally recognized as having done much to lead our English school onwards to the nobler walks of imaginative art. Mr. Watts, in "Dawn and Day" (165), unveils to view twin angels, or winged genii—the one with closed eyes floating amid the dispelled vapours of the night, the other with uplifted head rising into the golden "day." Michael Angelo has made such personations in marble familiar to us, and Mr. Watts is accustomed to think out kindred conceptions in Venetian colour; and it may be observed that the two masters, though widely severed, have at least this in common, that each was alike impatient of plodding labour and perfecting detail. Michael Angelo left his "Dawn" and "Day" on the Medici tombs as magnificent sketches, and in like manner Mr. Watts in his distinctive personations of "Dawn and Day" was content to relinquish his subject as soon as it reached the stage of a grand but vague suggestion. That genius has been in all ages greater in promise than in performance, is one reason why the world contains so many magnificent fragments. Mr. Poynter, in "Psyche's Awakening" (146), seems to have fallen under the inspiration of Turner's "Garden of Hesperides" and other like works, wherein wild mountains in sculpture-like masses and serrated outlines invade the sky. And, like his great original, Mr. Poynter endows his landscape with human interest by a figure which, in its well-considered action, tells its own story significantly. The painter has chosen the moment when Psyche, having been carried in a swoon on the wings of Zephyr from the high mountain of sacrifice, awakes into affrighted consciousness in the vale beneath. The action is highly dramatic, the figure has been well studied in the lines, the flow of the draperies have motion as when the Greeks signified action or passion; yet we incline to think that the colour tends to decorative prettiness in pale and purple blues, and that the execution is rather small and feeble for the grandeur of the conception. The same theme has been treated, though differently, by Raffaele, and also by the Danish poet-painter Frølich. "The Banks of the Styx" (163), depicted by Mr. Spencer Stanhope, affords yet one more example of the imaginative mythology to which certain of our painters are now addicted. The closely clinging figures of two lovers who on earth may have loved not too wisely, recall by the intensity of their anguish certain pictorial versions of Paolo and Francesca; they stand on the shore imploringly, and old Charon in his boat hastens to their rescue. A weird non-natural spirit pervades the scene; the figures hover as it were in uncertainty between two lives; they retain the remembrance of having been mortals, and yet they seem to be conscious of being ghosts in a land of dreams—a shadowy region here depicted in long-stretching caverns, catacomb-like, with still-flowing waters which run deeply. Yet we fear that Mr. Stanhope will have for long to rest content with an audience fit and few; though his conceptions are romantic, his treatment is apt to be somewhat hard, dry, and colourless. Among minor works that show the salutary influence of studies which take a retrospective range may be noted "Part of a Design from the Parable of the Ten Virgins" (202), by Miss Theresa Thornycroft.

The Dudley Gallery, by reason of its wide constituency, has always great diversity. Here are figure-painters and landscape-painters within the Academy, others who have been waiting long at the door, and many also who are lying hopelessly in the cold outside. All find a welcome within these hospitable walls. Mr. George Richmond, R.A., illumines the Gallery with the "Great Fire at the Pantheon as seen from Hyde Park" (20). The artist employs the same pallet and technique for the fire of a house that he would for the face of an alderman; he loads on his colours in bold relief, and at all events it must be admitted that his canvas burns as a furnace with liquid heat. Turner attempted an analogous impossibility in the burning of the Houses of Parliament. Mr. Hodgson, A.R.A., who certainly proves himself the most solid and sustained of recently elected Associates, launches yet another scathing satire against the supine sansculottes of Morocco. The painter finds occasion as heretofore for the display of firm drawing and decisive character in the indolent officials who, in true Oriental fashion, squat about "The Postmaster-General's Office, Tangiers" (76). The attitudes, though true to the life and apparently accidental, are deliberately studied. Mr. Storey also indulges in his accustomed humour when, under the title "Enough is as Good as a Feast" (216), he caricatures an old gourmand discussing a fine pheasant on the dinner-table, while a servant appears at the juncture with an equally handsome bird in her hand. We are again inevitably reminded of almost identical themes by Mieris, and yet Mr. Storey has not quite reached the perfect manipulation of the Dutch masters. Another satire verging on comedy or burlesque we owe to Mr. James Hayllar, who, in a "Visit to the National Gallery" (274), depicts two rustics seated, fast asleep, their backs being turned upon "The Baptism of Christ," by Pietro della Francesca. The incident rather than the quality of the art is the making of the picture. Mr. Wynfield, who in past years failed by reason of crude opposition of colour, has now with advantage changed his tactics. "The New Rose" (49) introduces the spectator to a lady whose pearly and opalescent dress is delicately relieved from a background of warm and sunny greys. Analogous experiments in what may be called monologies of colour have long been made in Belgium and France by M.

Willems, M. Alfred Stevens, and M. Hamon. Several English painters latterly show like proclivities. "Our Daughter" (139), by Mr. Arthur Hughes, has habitual grace and refinement; "The Young Signor" (313), by Mr. J. Forbes-Robertson, is a well-painted and expressive head. It is a pity that M. Legros cannot mitigate his inveterate naturalism; "A Fishmonger" (398) is as repulsive as it is vigorous.

The landscapes in the Dudley, though numerous, scarcely claim distinctive notice. It may be observed, however, that Mr. Alma Tadema, the figure-painter, has in "Sunny Days" (254) pleasantly beguiled a sylvan holiday. Sun and shadow play across hill and dale, wood and moorland, alighting on the foreground upon a little girl seated under an umbrella on the grass. The style is Continental; it has a breadth, intention, and sketchy suggestiveness alien to the painful elaboration from which our English students of nature have scarcely recovered since the days when the author of *Modern Painters* showed such kind encouragement to the so-called "Pre-Raphaelites." There are landscapes by Mr. P. R. Morris, Mr. J. C. Lewis, and Mr. Arthur Ditchfield which merit attention; we may also name for commendation a brilliant scene in "Venice" (208), by Mr. L. Pilleau; "A Wreck on Boulogne Sands" (160), by Mr. Arthur Severn; a fresh "Westerly Breeze" (207), by Mr. Hamilton Macallum; a study made on board ship by Mr. Henry Moore of the "Mediterranean in a Gale" (245). This artist takes to a hurricane as kindly as the stormy petrel. Not keener or swifter is the wing of a bird on the wind than the hand of the painter as it plays over the troubled surface of the waters. We have never seen truer drawing of waves driven fiercely before the wind. This is the original sketch for the picture in the last exhibition of the Royal Academy.

On the whole, these Winter Exhibitions scarcely give sufficient reason why they should exist at all. Yet, if purchasers prove plentiful and visitors numerous, perhaps it must be conceded that the primary purposes of all London exhibitions are substantially attained.

MR. IRVING'S HAMLET.

IT is satisfactory to observe the care and completeness with which the performance of Shakspeare has been undertaken at the Lyceum Theatre; and it is remarkable that while Mr. Irving is appearing with much deserved applause in *Hamlet*, a neighbouring theatre announces that Mr. Phelps will shortly appear as Falstaff in the *Merry Wives of Windsor*, and a rumour lately prevailed that the *Merchant of Venice* was to be produced at a house which has usually occupied itself with plays of quite another class. We believe that no opportunity has been offered to Londoners of seeing *Hamlet* since Mr. Tom Taylor made an experiment, of which the conception was better than the execution, at the Crystal Palace. Mr. Irving has fortunately sufficient talent and reputation to interest the public in his assumption of a new part, and we can only hope that that interest was as great as the newspapers represent, and that it may prove enduring. Happily almost every person of literary disposition has a special theory about the character of Hamlet, and is prepared to give a lecture on the subject with illustrative readings whenever an audience can be procured. The number of critics of Mr. Irving's performance was likely therefore to be large, and it is difficult to say whether Prince Charlie's match at Newmarket or the production of *Hamlet* at the Lyceum was the more prominent topic of discussion in the newspapers of last Monday.

It may seem a grudging tribute to Mr. Irving's talent to say that he was much less disagreeable in Hamlet than he has ever been before. But those who saw his Richelieu and saw the parody of it by Mr. Righton will easily understand that by perseverance in the same method he might have produced a Hamlet so unpleasant that the only alleviation of the annoyance would have been the hope that it might be the foundation of a burlesque. But in his present performance his voice and manner are greatly mitigated, and the whole result is that one would like to see the play again, and is not merely thankful that it is over. We hope nobody will be disturbed on hearing that Mr. Irving does not play Hamlet in a yellow wig, as has of late been usual. He retains the conventional style of dress, which is rather incongruous with the dresses of the other characters, in which an attempt has apparently been made to imitate the style of the supposed period of the play. The Ghost is as awful as can be expected in a small theatre; the soldiers have been fairly drilled, and do not exhibit that shakiness in the legs which takes off so much from the effect of military pageantry on the stage; an excellent comedian, Mr. Compton, has been engaged for the First Gravedigger; Miss Isabel Bateman is successful in Ophelia, and all the other characters are creditably filled. On the Turf, when they mean to be complimentary, they speak of a "level" horse, and we should call this a "level" play. Everybody who sees it will, we think, confess that the performance is even and well sustained throughout. Some critics may select particular scenes for high or perhaps extravagant laudation of Mr. Irving; we do not think it would be easy to fasten upon special points for censure. Taken as a whole, his performance is excellent, and he has made a great advance upon the reputation gained in a round of rather dreary characters.

It has been remarked that Hamlet must want his cloak during his conversation with the Ghost, but perhaps if it had been offered to him by his officious friend Horatio, he might have answered in the same sense as Nelson did to a similar offer

in the same locality. Nelson was a great believer in the precept "If you want a thing done do it yourself"; so he went in a boat at night to ascertain and re-buoy the "outer channel" leading to Copenhagen, and when he was pressed to protect himself with a boat-cloak against the "nipping and eager air" of the last night in March, he answered, or is reported to have answered, that "his anxiety for his country would keep him warm." It is not perhaps so wonderful that Hamlet should drop his cloak and hat as that Horatio and Marcellus should carefully pick them up and bring them after him. As they are so very much afraid that the Ghost may carry Hamlet off with him, it would seem that the last thing Hamlet would be likely to want in his father's company would be a cloak. These remarks may appear trivial, but it is impossible to avoid smiling when Marcellus comes on with something in his hand which, on careful inspection, proves to be Hamlet's hat. We believe that in the palmy days of tragedy the spectators were required to suppose that the hat fell off through Hamlet's hair standing on end when he saw the Ghost. Another respectable tradition was that of exhibiting two paintings, generally very bad ones, in the scene between Hamlet and his mother. Some ingenuity must have been employed in deriving from the text the first hint for this embellishment. It is by no means certain that the reigning King of Denmark looked the villain that he was, and, if he did, a Court painter would not be likely to represent his villany faithfully on canvas. When Hamlet was supposed to point to the second picture, he said:—

Here is your husband, like a mildew'd ear
Blasting his wholesome brother.

But it is highly improbable that the artist would have depicted a potential poisoner. Indeed this notion of the two pictures seems to be an effort of the same ingenuity which suggested that when Hamlet says,

Or that the Everlasting had not fix'd
His canon 'gainst self-slaughter,

he should make a movement as if laying a gun. When Hamlet says, "Methinks I see my father," Horatio, who was a sort of anticipation of these matter-of-fact critics, asks where, and Hamlet answers "In my mind's eye." We do not in the least complain that this play has been got up with some of that thrift which Hamlet imputes to the royal household of Denmark, and it is certainly better to have no pictures at all than to have shabby second-hand ones. We observe that a critic in the press recognizes the churchyard scene as having done duty in *Engene Aram*, and we must confess that that scene has something of the air of an old acquaintance. But the play is sufficiently, although not gorgeously, decorated, and much pains seems to have been taken to select and drill the company. The fencing-match has been carefully rehearsed, and the exchange of foils is managed perhaps as well as can be expected. Hamlet gets possession of his adversary's foil, and then throws his own foil to the adversary—by mistake, as we must suppose—and he neatly catches it. The fifth act as represented consists of the scene in the churchyard, the conversation with Osric, and the fencing-match, and throughout these scenes Shakspeare has in view not the manners of the fourteenth or other bygone century in which the events of the play happened, but the manners of his own time. The dress of Hamlet is more suitable to those manners than the dresses of Horatio and the King. But we do not attach importance to tailor's details unless a play-bill challenges attention to them.

One of Mr. Irving's warm admirers in the press ascribes to him "culture, intelligence, refinement," all which he certainly possesses. But it must be owned that he is not plentifully endowed with those physical qualities which in some great actors of this part have been abundant. Far be it from us to depreciate "culture," but, as Homer says, the glorious gifts of the Gods are not to be despised. The same admirer says that "the transcendent skill" of the actor is revealed in his first soliloquy, and he wonders how we could ever have tolerated the performer who stalked to the footlights and made a recitation. It is possible that a fine voice and a graceful person may have helped to mitigate our impatience. Indeed this writer admits that some of Mr. Irving's predecessors in the part "may have had more power over the emotions of the audience than he has," and this, we think, is true. But then it is suggested that these same predecessors may not have had "a just appreciation" of the character of Hamlet, and this we could readily believe. There had certainly not been nearly so much written about the character when they acted it, and perhaps they trusted to instinct more than to reason or reflection. One of the coarser-minded class of critics, being asked what Shakspeare meant in a particular passage, answered that he meant to "draw." Without adopting this low view of his purpose, we may suspect that, not having had the advantage of reading the commentaries on his plays, he had sometimes no very distinct notion of what his purpose was. It has been disputed at great length, and with much ability, whether Hamlet is really mad. Undoubtedly he begins with a purpose of feigning madness, and it may be that Shakspeare laid on the colour rather too thickly, allowing his wonderful power of thought and language to exercise itself without strict control. He certainly did, to a considerable extent, forget himself as he went on with the play, as appears from the unaccountable quiescence of the Ghost in the latter part of it. Critics perhaps do not allow quite enough for the unconscious operation of genius. It may be questioned whether either dramatist or actor does his best when he has a clear view beforehand of what he means to do and does it. We do not in the least undervalue the

conscientious study which Mr. Irving has given to this part. But we may venture to remark that that is not exactly what Shakespeare himself thought most desirable in an actor. When the Player has spoken the lines describing the fall of Priam and the grief of Hecuba, Polonius remarks that he has turned his colour and has tears in his eyes. Shakespeare had doubtless in his view some actor of his own time, probably of imperfect education, and not much given to meditation on the purposes of authors in composing plays, who possessed from nature this emotional talent and had continually exercised it. This talent, combined with advantages of voice and person, has enabled actors and actresses who were ignorant, idle, and selfish off the stage to feel and to arouse in the theatre noble, generous, and tender sentiments. Every word of Hamlet's comment on the recitation to which he had listened might be truly spoken of some performances of this class of actors:—

Tears in his eyes, distraction in 's aspect,
A broken voice, and his whole function suiting
With forms to his conceit! And all for nothing!

It was imputed to an eminent advocate that he used artificial means to produce tears. There have been, and perhaps are, advocates capable of weeping naturally whenever tears would improve the effect of a speech. We should certainly not retain an advocate of this stamp to argue a question of real property law in the House of Lords, but he might be very powerful with juries. We by no means say that Mr. Irving does not possess this faculty of feeling the part which he undertakes, but we observe that his admirers dwell emphatically on other faculties which do not alone make a first-rate actor. Nevertheless he has attained a considerable success, and we will end as we began by hoping that the public interest in his performance may be sustained and general. There can be no question that his Hamlet is well worth seeing.

RACING AT NEWMARKET.

MATTERS have decidedly mended at Newmarket this autumn. The authorities have at last become conscious of the necessities of their position, and have seen that, in order to maintain the prestige of Newmarket, not only must pecuniary inducements be held out to owners of horses, but also the daily programme of sport must be varied to suit the circumstances of the time. It was a happy idea at the Second October Meeting to throw the three Queen's Plates into one, and thereby to offer a prize worth fighting for; and, in consequence, instead of Lillian walking over, a good *bona-fide* field of eight horses came to the post, including Lily Agnes, the heroine of the Doncaster Cup, Eole II., Thunder, Scamp, and Pout-Etre and Christiana, presumably the pick of the foreign horses. The success of this experiment was sufficient to justify the belief that, if the Queen's Plates were fewer in number and of greater value, they would not end in a farce as often as they do now. At the Houghton Meeting, between three and four thousand pounds of added money was offered by the Jockey Club, and, moreover, the programme included some novel features of interest, such as the Jockey Club Cup, which would undoubtedly have given rise to a most interesting contest had it not been that Apology was amiss and could not take part in it. The Jockey Club also has been wise enough to decide finally that the Middle Park Plate shall not be abolished. We utterly fail to appreciate the reasons which have induced some of the leaders of the racing world to display a spirit of antagonism to this brilliantly successful and most popular contest. Such a paltry argument as that the Middle Park Plate so brings out the best form of the year as to spoil the betting on the Derby of the following year may be summarily dismissed. The motives of many racing men are mercenary enough no doubt; but it is not tolerable that such motives should be authoritatively recognized by those at the head of affairs as part of the creed of racing. Besides, betting is happily so restricted now that no one dreams of backing a horse for the Derby till within a few weeks of the race; and we may add that as the winner of the Middle Park Plate has never yet won the Derby, the great two-year-old contest teaches us what to avoid rather than what to follow when searching for the winner at Epsom. It was said also that the Middle Park Plate affected other two-year-old races injuriously, diminished the number of their subscribers, and destroyed their interest. Had this argument been founded on fact, it would not have been without weight; but we have never seen any evidence adduced in its support. The Clearwell, Prendergast, Criterion, and other two-year-old races are as interesting—or as uninteresting, according to circumstances—now as they were before the establishment of the Middle Park Plate; and the rich two-year-old sweepstakes have fallen into abeyance, not because the Middle Park Plate has extinguished them, but because so few owners of racehorses nowadays care to put down two or three hundred sovereigns when they can enter their representatives in engagements at an outlay of two or three. It was undoubtedly within the discretion of the Jockey Club to refuse or continue their highest prize to any one particular race; but when the five hundred sovereigns given for the Middle Park Plate were offered, first by one person, then by another, and lastly by a select body of breeders of blood stock, there was no earthly reason for declining the offer. Better counsels have fortunately prevailed; and one of the most attractive races of the year will still retain its place in the

programme of the Second October Meeting. There is another motion on the books to come before the next meeting of the Jockey Club which we hope will meet with merited rejection. It is proposed that no foreign horse shall be allowed to start for a handicap run in England unless he has been for three months in an English training stable. This really seems like an ebullition of childish ill-temper because Pout-Etre has won the Cambridgeshire of 1874 in a canter. It may be mortifying, no doubt, to English sportsmen to see all their carefully laid plans upset without an effort by a French horse; but it is unsportsmanlike to make an unfair retaliation for a fair defeat. Abolish all exemptions in favour of foreign horses, if you please; weight them as you please—the handicapper will take care of that in the Cambridgeshire of 1875—but do not attempt to shut them out. In the great mile handicap at headquarters the more competitors the merrier—at least every one thinks so except the starter—and the general racing at Newmarket would be poor indeed if the foreign contingent of racehorses were prevented from sharing in the contests. If English owners keep hundreds of horses in their stables, and find it more lucrative to lock them up than to bring them out on the racetrack, while French sportsmen send their representatives hither and thither, wherever good prizes are to be won, why should the latter be deprived of the fruits of their enterprise? We cannot believe that the motion of Sir J. Astley will meet with much favour at the hands of the supreme council of the Turf. If we want to beat the French, let us breed better horses than they breed, and run them fairly and squarely, and then we shall not fear any competition.

The general racing in the Houghton week was decidedly good, and was made more interesting by the great number of close finishes. On the Thursday, for instance, seven races out of eight were won by heads or necks, and some of the heads were so wonderfully short that it was impossible not to admire the extraordinary power of eye possessed by the judge. We will first glance at the two-year-old events, of which there was an abundance during the week. The Criterion was the *pièce de résistance* of this department of the sport, and ten runners came to the post. Lord Falmouth was represented by two, Garterly Bell and Ladylove, and Count de Lagrange also ran two, Mirliflor and Tartine. The former of this pair had evidently done no work since the last meeting, and his injured foot will very probably prevent him from taking a prominent part in the three-year-old races of 1875. Otherwise he would be a very formidable opponent, for there is not a finer-looking two-year-old in training. Balfie (with 4 lbs. extra) and Vm Victis also ran, and Balfie was made the favourite, despite his known dislike to a longer course than half a mile, while Mirliflor was second favourite, though hardly able to raise a gallop. The French horse was never in the race, and limped with difficulty into the saddling enclosure, while Balfie, after pulling double for half a mile, stopped as usual in the last two furlongs. Thenceforward Lord Falmouth's pair had the finish to themselves, and Garterly Bell, who was receiving 4 lbs. from his stable companion Ladylove, drew away and won by three lengths. Balfie partially atoned for his defeat by winning two valuable races later in the week, but they were uncommonly near things, and his backers had a very unpleasant moment in each case till the numbers went up. The careful handling of Cannon brought Prince Soltykoff's speedy but faint-hearted colt home before Earl of Dartrey in one race, and Cataclysm in the second. Both these victories were won over the Bretby Stakes course; and on both occasions Balfie would have won in a walk at half a mile, but tried all he could to give it up in the last quarter. Another shifty performer, Strathavon, won the Free Handicap Nursery from a large and not indifferent field, and Craig Miller showed vast improvement on his form in the Second October Meeting by running away from Moriturus and Yorkshire Bride in the Home Bred Foal Stakes. It would appear by the running of this colt at the three autumn meetings at Newmarket that he prefers the downhill two-year-old course to the ascent at the end of the Rowley mile. The New Nursery Stakes resulted in a splendid race between four—Miechowitz, Breech-loader, La Sautouse, and La Friponne. Won by a head, dead heat for second place, fourth beaten by a head, was the judge's verdict. In the Glasgow Stakes Dreadnought cantered away at his pleasure from Semper Durus, and in the Bretby Nursery Stakes Per Se—of course honoured with the top weight—was provokingly beaten by the shortest of heads by the German-bred Waisenknabe, a son of Buccanoeur. In the Post Match between Lords Falmouth and Lonsdale, Garterly Bell, the fine-looking and fast improving representative of Lord Falmouth, achieved an easy victory; and in the Old Nursery Stakes, run over the Rowley mile, Trojan gave Waisenknabe 10 lbs. and beat him so easily that, taking the line through Per Se, he must be not far removed from the best of his year. Glancing rapidly at the remaining racing of the week, we may notice that the Trial Stakes produced a good race between two good horses, Thunder and Royal George; the superior class of the former, however, bringing him home an easy winner, while a French impostor, Daniel, played the part of looker-on. Lady Rosebery, after a long retirement, came out in the All-Aged Trial Stakes, which she won in a canter from Slumber and Lady Glenorchy. Quantock also showed some return to his spring form by running away in the Stand Handicap from Chieftain (second in the Cambridge), Xanthus, Aurora (winner of the Great Eastern Handicap), and Eva. A small but highly select field, consisting of Apology, Leolinus, Spectator, Lemnos, Novateur, and Whitehall, came out for the Free Handicap Sweepstakes across the flat. As winner of the St. Leger, Apology had to carry

9 st., and as winner of the Prince of Wales Stakes at Ascot, Leolinus was weighted with 8 st. 8 lbs.; but both these fine horses were unfit to show their true form on this occasion. Leolinus has done little work since Doncaster, and Apology was obviously amiss, and it was almost a pity to expose her to certain defeat. The issue was thus left to Lernas and Spectator, and the former, running the longest, won a good race by a neck. Lord Wilton was, however, more successful in the Rowley Handicap, which his Carmelite secured after a close finish with Xanthus and Genuine. Two Cambridgeshire horses, Gamecock and Benedictine, took part in this contest, but were never conspicuous; and indeed the Hungarian horse was palpably lame. As Apology was prudently withdrawn from the Jockey Club Cup, Gang Forward had an easy task to beat Feu d'Amour, La Courseuse, Lillian, and Christiana, and the last-named has quite failed to sustain the high character with which she came over to this country. The Houghton Handicap all but collapsed, but at last six starters were got together, and Castle Wollan, better known as the Gelding by Artillery out of Pinesse, won easily from Slumber, Quantock, Night Star, and Dovedale—the silly of Headman out of Columba.

Finally, Prince Charlie took leave of the Turf amid a scene of excitement such as has never been witnessed in our time on an English racecourse. On the last day but one of the meeting he had disposed of Montargis and Novateur in his usual style over the Bretby Stakes course; and immediately afterwards he was matched against Pent-Etre, the winner of the Cambridgeshire, at weight for age, over the Rowley mile. No match in our time, not even that between Julius and Lady Elizabeth, has ever created such intense interest. Not only is Prince Charlie the most popular horse ever trained at Newmarket—quite the idol of the multitude—but there was a good deal of national feeling mixed up with this match, and most fervent were the prayers that the splendid son of Blair Athol might be able to lower the colours of the disagreeable Frenchman who had come over and made such mince-meat of the Cambridgeshire field. Although a mile is rather beyond Prince Charlie's distance, and he had evidently not been doing very severe work, the confidence of his supporters—and they were legion—never failed, and was amply rewarded by the event. When the two horses were saddled in the Birdage, the contrast in their appearance was remarkable. Prince Charlie towered like a giant over his antagonist, while Pent-Etre's somewhat mean-looking head diminished the favourable impression created by his strong and well-shaped limbs and his perfect condition. Equally remarkable was the difference in their styles of going. Prince Charlie gallops like a piece of machinery, and so easily that, when going his fastest, he never seems to be going fast, while Pent-Etre has a quick short stride, and his pace is more apparent than real. The day was unfavourable for a roarer, and as a matter of course the rider of Pent-Etre tried to find out Prince Charlie's weak point, and to cut him down. Vain was the attempt. The French horse could never get away from the English champion, who waited till he got to the Bushes hill, and then came sailing away at his leisure, winning ultimately by half a length, which might have been half-a-dozen lengths if required. Pent-Etre stuck to his work well, and Chaloner never left off riding him, in case Prince Charlie should stop at the hill. But he was overmatched. A good handicap horse is apt to be overrated; and he is also apt to find his level when taken out of handicaps and pitted, at weight for age, against a first-class weight-carrier. Pent-Etre is a good horse, undoubtedly, but he has found his master; and the cheers—unusual at a place so business-like and so undemonstrative as Newmarket—which greeted Prince Charlie on his return to the enclosure testified to a feeling of thankfulness not only that the grandest and speediest of modern racehorses had passed through his final trial with credit, but also that the Frenchmen had not quite succeeded in taking everything away from England at the close of their autumnal raid.

REVIEWS.

GREVILLE'S JOURNAL.*

MR. REEVE has discharged with taste and judgment an instalment of the duty which was entrusted to him by his late colleague and friend. Mr. Greville displayed his usual good sense in expressing to Mr. Reeve the opinion that such Memoirs as his own ought not to be locked up until they had lost their principal interest by the death of all those who had taken any part in the events which they describe. In the exercise of his discretion Mr. Reeve has erred, if at all, on the side of extreme prudence, for the lapse of more than thirty-seven years since the death of William IV. has removed from the scene all, or nearly all, the persons who took part during his reign in political affairs. Perhaps the only passage in the published portion of the Memoirs which could at present cause any offence is a probably unfounded charge against a lady who is still alive of having had thick ankles in her youth. Although the Journals ending with the death of William IV. are highly interesting, there can be little doubt that the part which is reserved for a later generation of readers will be still more valuable. Imagination and some other intellectual

qualities generally attain their highest perfection during the physical prime of life; but accuracy of social observation, judgment of character, and fidelity of delineation are accomplishments which ripen late. It is true that, from circumstances combined with natural faculty, Mr. Greville became in early youth a cool-headed man of the world. The crudeness which belongs to inexperience is indicated in the earlier part of his Journals by a certain hardness and intolerance which were probably mitigated in after life. Mr. Greville seems never to have been carried away by enthusiasm for any of the eminent persons with whom he was familiarly associated, though he always retained his early admiration of Canning, with whom he seems to have had no personal acquaintance. His criticism of their characters and acts is perhaps not the more just because it is for the most part severe. His judgment appears never to have been favourably influenced by his personal relations with those whose notice would have flattered the vanity of ordinary persons. The Duke of Wellington was a friend of Mr. Greville's family; and in the height of his fame and power he admitted the young Clerk of the Council to personal intimacy; yet day by day Mr. Greville recorded in his Journal his disapprobation of the Duke's policy, and of his alleged defects in character and judgment. He sometimes expresses with impartial candour his appreciation of the Duke's merits, and he even praises his speeches in the House of Lords; but in the end he always reverts to his habitual tone of censure. It would seem that Mr. Greville possessed in an unusual degree the power of detaching his judgment from his personal feelings, though he was perhaps more liable to be biased by antipathy than by friendly partiality. Of George IV., who seems to have distinguished him by frequent notice and personal attention, Mr. Greville invariably speaks with contemptuous detestation. On one occasion the King took the trouble to apologize for not having invited the Clerk of the Council to dine with the Ministers. His excuse was that, if he had invited Mr. Greville, he could not have made any exception, and "he would be d—d if that fellow Ellenborough should ever sit at his table." If George IV. had known that Mr. Greville would be one of the historians of his reign, he would perhaps have been less disinterestedly anxious to secure his good will; but no condescension or flattery would have conciliated the implacable severity of the memoir-writer. "I do not know anybody," says Mr. Greville, speaking of George IV., "who is proof against the seductions of princes when they think fit to use them in the shape of civility and condescension." Two or three sentences before, his own superiority to such weakness had been proved by an expression of "the opinion I have long had, that a more contemptible, cowardly, selfish, unfeeling dog does not exist than the King on whom such flattery is constantly lavished." As Mr. Reeve says, Mr. Greville avoided as far as possible any mention of himself. The Journals might not have possessed more historical value if they had been interspersed with fragments of autobiography; but some illustration of the writer's character would have rendered them more attractive. As no personal narrative is really acromatic, it is best understood when there are opportunities of making due allowance for the special colouring communicated by the author. It might almost be said that there was a kind of unfairness in discussing others without allowing reciprocal facilities for criticism. The greatest masters of that department of literature in which Mr. Greville will henceforth hold a high place have delighted in the minutest exposition of their own characters and peculiarities. St. Simon dwells incessantly on his hobby of the pre-eminence of dukes and peers; and Horace Walpole has compelled all mankind to take an interest in his gimeracks at Strawberry Hill. When the survivors of Mr. Greville have died out, his Memoirs will throw only an incidental and involuntary light on the character of the writer.

It is perhaps more just to cultivate gratitude to a public benefactor than to investigate the drawbacks which affect his munificence. No equally important contribution to the political history of the last generation has been made by any previous writer. As a man of rank and fashion, Mr. Greville associated on terms of equality with all the statesmen of his time, and his long tenure of a permanent office immediately outside the circle of politics compelled him to observe a neutrality which was probably congenial to his character and inclination. A cadet of the family of the Earls of Warwick, he was on the mother's side a grandson of the Duke of Portland, who secured to him, after the custom of the time, the reversion of the office of Clerk of the Council, and of the valuable sinecure of the Secretaryship of Jamaica. Mr. Reeve says that he was educated at Eton and Oxford, and it appears from his mention of a meeting with Dr. Russell that he must at one time have been at school at the Charterhouse. At the age of twenty he was Private Secretary to Lord Bathurst; and when he was twenty-four he succeeded to the reversion of the joint Clerkship of Council. His official income enabled him to gratify his taste for the Turf; and he combined with his public functions the management of the Duke of York's racing stud. Of his patron he speaks with unusual lenity, describing him as the only member of the Royal Family who had the feelings of an English gentleman. The Duke of York communicated to the manager of his stud his dislike of the Duke of Wellington, which seems to have been founded on his own disappointment at not having been appointed to the command of the English army in the Peninsula. It perhaps never occurred to the Duke of York that he might possibly not have fortified Torres Vedras, nor have won the battles of Salamanca, Vittoria, and Toulouse. About the

* *A Journal of the Reigns of King George IV. and King William IV.* By the late Charles C. F. Greville, Esq. Edited by Henry Reeve. London: Longmans & Co. 1874.

same time Mr. Greville says that the King also dislikes the Duke of Wellington, whose estimate of the character of his Sovereign was not complimentary. Some years afterwards Mr. Greville says that the Duke

can address the King in a style which no other Minister could adopt. He treats with him as an equal, and the King stands completely in awe of him. It will be long before a correct estimate is formed of the Duke's character and abilities; his talents, however, must be of a very superior, though not of the most shining, description. Whatever he may be, he is at this moment [in 1839] one of the most powerful Ministers the country has ever seen. The greatest Ministers have been compelled to bend to the King, the aristocracy, or the Commons; but he commands them all.

Some recent commentators on the Memoirs have intimated unnecessary disapproval of the sources from which Mr. Greville's ample income was derived. In the reign of George III. it was as natural for a prudent Prime Minister to procure a rich reversion for his grandson as to leave his estate to his son. Mr. Greville was Clerk of the Council and Secretary for Jamaica, as his uncle was owner of Welbeck, and he apprehended no danger to his own interests except from causes which equally affected the whole English aristocracy. The deference of the House of Lords to the Duke of Wellington in the matter of Catholic Emancipation had, in Mr. Greville's opinion, "given a blow to the aristocracy which men only laugh at now, but of which the effects will be felt some day or other." It is characteristic of his class that at that time he despised and disliked the Church, in the spirit of the French noblemen who admired Voltaire on the eve of the Revolution. The House of Lords had in his opinion disgraced itself by voting for Catholic Emancipation against the real convictions of its members. "The Oxford parsons," who did exactly the contrary, "behaved abominably at the last election." "I am convinced that very few years will elapse before the Church will really be in danger. People will grow tired of paying so dearly for so bad an article." It may be conjectured that Mr. Greville expected that the tithes would, on the abolition of the Church, revert to the landowners. When Mr. Greville went to Italy he was at first interested in the novel spectacle of popular devotion in Catholic countries; but after a time he discerned the hollowness of some of the most touching ceremonies, such as the washing by devout ladies of the feet of the pilgrims in St. Peter's. Nevertheless in a spirit of cosmopolitan liberality he vowed a silver horse-shoe to the Madonna of the Pantheon, as the price of her intercession in respect to a watch at Newmarket; and the votive offering with which, when his mare won, he like a gentleman performed his engagement, is probably still suspended in the Pantheon.

Although Mr. Greville, according to the statement of his editor, frequently revised and corrected his Journals, he abstained with scrupulous good faith from correcting by the light of subsequent experience errors of statement or of judgment. Contemporary memoirs cease to be trustworthy sources of knowledge when they usurp the functions of history. It is not uninteresting to learn that, probably sharing the impressions of the society in which he lived, Mr. Greville during the latter part of George IV.'s life thought slightly of Peel, was surprised when Lord Palmerston began to take a conspicuous part in debate, and hastily arrived at the conclusion that Lord Melbourne "had nothing in him." When William IV. succeeded his brother, his Clerk of the Council in an unusually friendly mood expressed the opinion that "he seems a kind-hearted, well-meaning, not stupid, burlesque, bustling old fellow, and, if he doesn't go mad, may make a decent king, but he exhibits oddities." A few months later Mr. Greville discovered that "he turns out to be an incomparable King, and deserves all the encomiums which are lavished on him"; but ultimately he returned to the conviction that William IV. was a simpleton and almost a buffoon. It may be some consolation to the admirers of royalty that Mr. Greville, while he abused the King, seldom praised or tolerated any of his subjects. On the occasion of the change of Ministry in 1830, he inserted in his Journal an elaborately censorious criticism on the conduct and character of the Duke of Wellington. Some years afterwards he added a memorandum to the effect that his attack was partially unjust. It was certainly not suggested by undue partiality for the Duke's successors in office. Of Brougham he always at this time speaks with extreme dislike, and "my mind has always misgiven me about Lord Grey, and what I have lately heard satisfies me that a more overrated man never lived, or one whose speaking was so far above his general abilities, or who owed so much to his oratorical plausibility." The appointments of "Graham to the Admiralty, Melbourne Home, Auckland Board of Trade, are all bad. The second is too idle, the first too inconsiderable, the third too ignorant." "A more miserable figure was never cut than Althorp's. . . . If Althorp and Poulett Thomson are to govern England, these things are likely to happen." About this time Peel's great superiority to all competitors began to dawn on Mr. Greville's mind, and, while he denounces the selfish and unamiable character which he fancied that Peel possessed, he loses no opportunity of dwelling on his acknowledged superiority to all rivals on either side of the House of Commons. He was convinced that he would never again take office with the Duke of Wellington, and it was not then certain whether his connexion with Lord Lyndhurst would continue. As the event showed, the Duke recognized the greater political aptitude of Sir Robert Peel, and was contented to take the second place in his Government; and Lord Lyndhurst, after the failure of some abortive intrigues, cast in his fortunes with the indispensable leader of the party.

With the reign of William IV. a new chapter of history opens,

and by this time Mr. Greville had both acquired much knowledge of public affairs and had attained by practice increased facility and skill in his own chosen art. If there were not several precedents of the same self-denying ambition, it would be surprising that a man of ability should be content to employ great intellectual powers in elaborate literary compositions destined exclusively for the use of posterity. Like St. Simon, Mr. Greville cultivated a polished style without a hope of any but a posthumous literary reputation. It was known during his lifetime that he kept a political journal, but whether he possessed the qualities of a successful writer of memoirs was only a matter of conjecture. Notwithstanding his anxiety to efface himself and his personal peculiarities, it is interesting to observe that he incidentally resembled St. Simon in supercilious contempt for that part of mankind which was unconnected with the higher aristocracy. At a Court held after the accession of William IV., at which addresses were presented from Oxford and Cambridge, Mr. Greville "never saw so full a Court, so much nobility with academical tag-rag and hobtail." "When the mob (of University graduates) could be got rid of, the table was brought in, and the Council held." He once "came up to town to dine with the Villiers at a dinner of clever men got up at the Athenæum, and was extremely bored." In addition to some persons of his acquaintance, the party included Buller, Romilly, Senior, Maule, and Walker, the author of the *Original*. Charles Buller was perhaps the wittiest man in England, and Maule was the greatest humourist of his time; but neither of them then belonged to the exclusive circle which was Mr. Greville's world. He politely reminded Maule that they had both been pupils of Maule's uncle, who, as he says, used to cane his nephew while he held him suspended by the hair of his head. "He looked up and said, 'Oh, it is too long to talk about,' and then turned back to his paper. So I set him down for a brute like his uncle, and troubled him no further." It might have occurred to a man of the world that reminiscences of a miserable boyhood are not always welcome.

Curious students of bygone scandal will find in the early part of the Memoirs many details of George IV.'s relations to the last English incumbent of the office which was held in France by the Pompadours and the Du Barrys. The methods by which the Duke of Wellington governed the King have a more respectable interest; and even at this distance of time the Duke's obstinate reluctance to form new alliances after conceding Catholic Emancipation suggests a feeling of irritation or regret. Lord Grey, who had fully shared the Duke of Wellington's dislike of Canning, would, almost down to the close of George IV.'s reign, have been willing to join the Government on reasonable conditions. Overtures were made to Lord Palmerston, who naturally required the admission of Huskisson, Melbourne, and other political allies; but there was no serious effort to strengthen the Ministry, which virtually consisted of Wellington, Peel, and Lyndhurst. The period which followed was stormier and more exciting; and from the introduction of the Reform Bill it became necessary for statesmen to take account of popular forces as well as of personal interests and claims. The first volume of Mr. Greville's Memoirs is the least valuable; and yet, if it had stood alone, it would have deserved and attracted universal attention.

(To be continued.)

GREEN AND GROSE'S HUME.*

(Second Notice.)

WE now go on to consider sundry details of Mr. Green's criticism from the point of view we explained in our first notice. Mr. Green's own description of philosophy is "a progressive effort towards a fully articulated conception of the world as rational." The description seems harmless enough—all but the last two words, which probably imply that which Mr. Green soon afterwards upholds as "the faith that all things may be understood." If so, we cannot accept them: still less can we accept the statement that the genius of Hume was governed by this faith. It appears to our humble empirical judgment that one great merit of Hume was his refusal to assume that all things might be ultimately understood. Hume distinctly recognized these two things; that when we put unreasonable questions we shall never get reasonable answers, and that when we put reasonable questions we may have to wait a long time for the answers. We pass on to Mr. Green's account of "the true notion of the relation between thought and matter." He tells us that the world is constituted by self-conscious thought. In one sense we can say there is a good deal of empirical truth in this, but we should also say that a great part of the work is done both for the race and for the individual at a stage of thought long before the consolidated complexity of adult human consciousness. It further appears that but for our mental construction the world would be "a chaos of unrelated and therefore unmeaning individuals," which seems equivalent to Ferrier's "world of nonsense." The chief drawback to this way of speaking is that all creatures below the level of self-conscious reason are doomed without hope to live in this world of nonsense. Ferrier boldly took the consequences, and called the lower animals "incarnate absurdities gazing on unredeemed contradic-

* *The Philosophical Works of David Hume*. Edited by T. H. Green, Fellow and Tutor of Balliol College, Oxford, and T. R. Grose, Fellow and Tutor of Queen's College, Oxford. Vols. I. and II. (A Treatise on Human Nature, &c.) London: Longmans & Co. 1874.

tion." To an empirical thinker this is of course violent and arbitrary. One cannot help asking whether there must not be degrees of chaos. Do differences of sense and structure mean nothing? Is the world no less or otherwise nonsensical to a dog than to an oyster, no less or otherwise chaotic to a bee than to a starfish? Likewise one cannot help thinking that the same difficulty applies to children. We have no reason to suppose that a new-born child is self-conscious as we are; at what age then does a baby cease to be an incarnate absurdity and escape from the chaos of unrelated *individua*? But we cannot expect transcendental systems to take thought for children and animals. As concerning matter Mr. Green tells us that the contrast between thought and matter is a delusion. "This necessary illusion is our bondage; but when the source of illusion is known, the bondage is already being broken." If this be the key of true knowledge, it does not say much for the progressive character of philosophy. For the "necessary illusion" is most ancient and orthodox Hindu doctrine, and moreover is expressed quite in the Hindu manner. The destruction of Hume and the reconstruction of Kant and Hegel might have been spared, for all these things were written a thousand years ago in the books of the Brahman doctors, and only waited for Colebrooke and others to make them known in Europe. However, it is allowed that "the world as in space and time" may be real enough "as a stage in the process by which self-consciousness constitutes reality." We confess that this is a proposition which we can neither affirm nor deny, for we do not know what it means; but we dimly suspect that this kind of provisional reality is that which the poor empirics are content to put up with as the only one they can get, though unwillingly as they find it sufficient for all practical purposes. One thing is clear, that Mr. Green will not be satisfied with any account that experience can give him; and, more than this, he seems loth to believe that experience can be satisfied with her own account. Mr. Green reproaches modern popular logic with holding "that propositions at once real and general can be derived from experience;" whereas, as his marginal note pithily states it, "particular experiment cannot afford general knowledge." If popular logic holds any such thing, we leave it to its fate; we simply accept Mr. Green's statement, and say that there is not any general knowledge in his sense. Again, the student of popular logic is supposed to lament that Locke did not understand "how an observation of co-existence in the bare instance, if the instance be of the right sort, may warrant a universal affirmation." It does not warrant a universal affirmation. No doubt there are a great many affirmations which we practically find it worth while to treat as universal; but that is a different matter, and we look back thankfully to Hume as the master who clearly pointed out the difference. The ground of all scientific affirmation is "the supposition that the future resembles the past"—in modern language, the uniformity of nature. Now this is itself an assumption incapable of proof. We make it because we find—to adopt a phrase which Mr. Green apparently means to be dyslogistic, but in which we protest we can see no harm—that it enables us to guide our conduct in life and get what we want. Again, we are told that Hume abolishes the absolute character of mathematical certainty; so be it. There is now plenty of mathematical authority, though in Hume's time there was not, for saying that the truth of geometrical propositions is in fact not known to be absolute. There is no doubt "an absolute sort of exactness that the mathematician himself supposes," but this is only hypothetical. We must notice that Hume deserves more credit than Mr. Green gives him for having seen that this ideal mathematical equality does not admit of any simple and obvious definition, though he was indeed hasty in concluding that it admits of no satisfactory definition.

The larger question of our conception of space, to which the discussion of mathematical truth hangs on, is one on which Mr. Green naturally has Hume at an advantage. It is beyond question that Hume's account is inadequate; but for us this admission means, not that his method was hopelessly wrong, as Mr. Green would have it, but that the materials for an adequate account did not exist. To censure him for not having done better is in effect to complain of him for having come about a century and a quarter too soon. Much that with Hume was guesswork is now definite hypothesis, if not more. We must not be understood to admit that Hume's work had no positive value when it was done; but that is matter of history, and what concerns us now is to remark that the present state of the empirical theory is independent of any criticism on Hume. It is not clear, however, that even here Mr. Green and Hume are not thinking of different things. Mr. Green seems to have in his mind extension in general, or as belonging to the reality of things, while the space Hume deals with is space as measurable; or, to speak in more usual though perhaps less accurate terms, Hume professes to account only for the conception, while Mr. Green criticizes him for not accounting for the perception. This distinction between the world of extension and our subjective measurement of it, and the confusion that arises from not attending to the distinction, had been pointed out by Spinoza in a letter (No. 29) which anticipates much modern controversy. He regarded space and time, considered as measurable, as purely subjective—"dumtaxat auxilia imaginationis"—herein, as we think, agreeing with Hume. But Hume's argument on infinite divisibility does seem not careful enough to avoid the confusion noted by Spinoza; he can hardly escape from the category of those "qui postquam sibi persuaserant lineam ex punctis componi, multa invenire poterunt argumenta

quibus ostenderent lineam non esse in infinitum divisibilem." Mr. Green's own account of extension is that it is "the relation of mutual externality." It seems to us that his own favourite form of objection may be here retorted on him. The explanation assumes a knowledge of the thing to be explained. Externality is a highly abstract term which cannot be made intelligible except by reference to our knowledge of extension. If any one should ask us what we mean by externality, we know not how we could reply except by bidding him observe with Hume that "the paper on which I write at present is beyond my hand. The table is beyond the paper. The walls of the chamber are beyond the table." Or, if externality means more than this, it means that two bodies cannot be in the same place at once, in which case the explanation leaves us worse off than we were before, that is to say, with Matter as well as Space on our hands. Again, we might say that the notion of externality involves the ideal synthesis of visible and tangible extension; but then Mr. Green has only stated in a condensed and obscure form the very problem on which empirical philosophers like Spencer and Helmholtz are now seeking to throw light from different quarters. Perhaps, however, the real virtue of the proposition lies in the word *relation*, to which Mr. Green attaches a peculiar and transcendental importance in almost every place where he uses it.

We cannot dwell on the somewhat parallel discussion of the idea of time. But one of Mr. Green's remarks is singular. Hume said that when we perceive things in succession—for instance, when we hear a series of musical notes—there is no "impression" other than the successive impressions of the notes, and by considering these impressions simply as successive we form the abstract idea of time. (Of course empirical thinkers do not suppose that this kind of abstraction is consciously performed, although transcendental criticism often proceeds as if they did suppose it.) On this Mr. Green says:—

If time is the impressions, it must have the specific sensuous character which belongs to these. It must be a multitude of sounds, a multitude of tastes, a multitude of smells—these one after the other in endless series. How then can such a series of impressions become such an idea, i.e. so grow fainter as to be "conjoined" indifferently "with any impressions whatever"?

Such an argument seems to us to go the whole length of scholastic realism. For in like manner, if a sphere is a spherical body, it must have the specific sensuous character which belongs to that body—a particular size, colour, and weight. If an army is the soldiers, it must have the specific sensuous character which belongs to that assemblage of men; it must be so many men, of this and that particular stature and complexion, clad in such and such uniforms. How then can such a bundle of impressions in either case "so grow fainter as to be conjoined indifferently" with any other spherical body or any other multitude of armed and disciplined men?

A good deal of space is given to the criticism of Hume's doctrine of Cause and Identity. We find that this involves the same confusion, or perhaps we should say, deliberate refusal to allow a distinction, which we noticed at the outset as a mark of transcendental criticism in general. The empirical account of thought and experience is accused of presupposing thought and experience themselves because it presupposes the elements out of which thought and experience are organized. Mr. Green says that Hume makes the conceptions of cause and identity come each before the other:—

The "custom" which generates the idea of cause must have done its work before that which generates the supposition of identity can begin . . . the conceptions of causation and identity are correlative—not results of experience of which one must be formed before the other, but co-ordinate expressions of one and the same synthetic principle, which makes experience possible.

This misrepresents the empirical hypothesis, which is that the conceptions grow up together as co-ordinate expressions, not of a transcendental principle, but of experience itself—i.e. a continuous experience beginning with the beginning of life, of which our present organized experience is the outcome. If the growth of the two conceptions is so intimately connected that we cannot explain either in its finished form, and in terms of our organized experience, without using the other, that is just what we should expect. The result which to Mr. Green is a stumbling-block of contradiction is to the empirical thinker one of the facts that support his hypothesis. Objections of this kind seem to us much as if one should say that it is impossible ever to make a dictionary because no one word can be explained without using several other words which likewise have to be explained. Mr. Green goes on to show that Hume reduces the uniformity of nature to an expectation. This charge we have already admitted; all we profess to know is that the growth of the expectation can be explained—as witness e.g., Mr. Spencer's chapter on Laws—that it has hitherto been justified by its fruits, and that we cannot do without it. Then Mr. Green says the "strength of such expectation must vary indefinitely." It does vary indefinitely. The number of people who firmly and consistently act on the belief that nature is uniform are still a mere handful. Or, if Mr. Green's *must*—ought in a logical sense, as we rather think it does, we say the idea of logical compulsion either way is here out of place. He goes on to say that an empirical habit of expectation "could never make us believe that a feeling felt after another—as when the motion of a bell is seen after the sound of it has been heard—represents the real antecedent." We have no room to discuss the argument, but the instance is unhappy. The motion we see neither is nor represents an antecedent of the sound that has reached us. Does Mr.

Green look on the motion of a swinging bell as an entity which is put into it when it begins to swing and stays there till the bell stops?

As concerning identity, the criticism is of the same type as on other points—namely, an endeavour to show that the empirical explanation is preposterous; we are glad by the way to see that Mr. Green uses this word in its strict and proper meaning. Hume says, according to Mr. Green, "that, the idea of an identical object being given, we mistake our successive and resembling feelings for such an object." But the idea is not given; it is the ideal consolidation of the successive and resembling feelings themselves. Or rather this is the part of it which Hume considered. For us the idea is not complete without social elements—i.e. it includes the belief that the thing is real and identical for you as well as for me. These social elements of psychology are yet to be explored. Still Hume was on the right track as far as he went. As for Hume's use of the word "mistake" in this connexion, it was no doubt unfortunate. There is no question, at least no reasonable question, of our being mistaken in our unthinking belief that the pen we hold now is the same pen we held five minutes ago. But it is a reasonable question whether this belief, at first sight a simple thing, is not in truth an exceedingly complex thing. Mr. Green seems to think he makes a point when he remarks that, if the vulgar do not suppose the pen or paper immediately perceived to be a symbol, neither do they suppose it to be a sensation. Why should they do so on the empirical hypothesis? They would suppose quite wrong, for it is not a sensation, but a bundle of sensations wrought upon by the fully organized ideas of external reality and identity. We should notice that in divers places Mr. Green speaks as if Hume sought to reduce consciousness to a kind of Indian file of single successive "impressions," or perhaps at most one "impression" and one "idea" abreast. We can find no ground for this in Hume, and nowadays the extreme complexity of consciousness at any given moment is the very corner-stone of empirical psychology.

We have had to give the foregoing specimens of our reflections in a somewhat bald and disjointed form. The general result as concerning Hume is somewhat as follows. Hume assumes a world of "impressions" occurring with certain uniformities of succession and persistent combination, and "ideas" related to them in certain ways, and with these assumptions he does his best to explain our matured habits of thinking. He does not pretend to explain why things happen uniformly, nor does he profess to understand (unless very incompletely) how we are able to perceive them as uniform, or to store up the fruit of "impressions" in the shape of "ideas;" and he is perfectly aware that, being able to think only according to our present formed habits, we cannot reproduce our immature phases of thought (see Part III. sec. 2, of the Treatise). Above all, he will rather go without an answer, or wait for more knowledge, than put up with a useless one. Criticism is thrown away on showing that Hume did not accomplish any of the things which he distinctly refused to attempt. The question whether he ought to have attempted them is in effect the fundamental question at issue between the transcendental and the empirical school of philosophy.

HARRY HEATHCOTE OF GANGOIL.*

MR. TROLLOPE has presented us in this little story with some further results of his Australian experience. Though the story is a very short one and perfectly unpretending, we do not know but that it gives the pith of a large part of the information stated in a more statistical shape in the author's travels. Mr. Trollope is of course too good a storyteller to fall into the error of mixing a novel with a blue-book. Anybody who wants to have his judgment in detail upon Australian land-laws or systems of farming must go to the big book, and not to the little one. But the novel gives as distinct a picture as its heavier predecessor of the general character of Australian bush life as it presented itself to Mr. Trollope. We fancy indeed that Mr. Trollope felt himself a little hampered in recording his personal experiences by his very proper regard for the confidences of private life. He could not say quite freely how the life of a settler appeared to him, for fear of being supposed to aim at this or that particular gentleman who had hospitably entertained him; and therefore he probably felt that he had still a little material left which could be worked up into his more familiar form of literature. Harry Heathcote of Gangoil corresponds, we presume, to no particular Harry in Queensland; but he is, we may hope, for he is a very good fellow, the essence of a good many Harrys who are growing wool in that rising colony.

Harry is by birth an Englishman, and has hardly been long enough at the antipodes quite to rub off his home peculiarities. The indigenous Australian has scarcely developed a distinctive type, though there are sufficient signs that such a process is taking place; and therefore Mr. Trollope is quite as much at home with him as he would be with his favourite squires and parsons in Barsetshire. In this respect, as in some others, the novel reminds us by contrast rather than by likeness of some of Mr. Henry Kingsley's earlier novels. Although they showed some traces of that eccentricity which has grown into startling proportions in Mr. Kingsley's later works, they had some very genuine merits as a brilliant, though, it may be, over-

coloured, description of a new variety of life. Mr. Kingsley had, indeed, some considerable advantages. One of his most thrilling passages was a tremendous fight with bushrangers, involving a breakneck gallop, a plentiful use of revolvers, and all kinds of hairbreadth escapes. The bushranger appears to have seriously degenerated. There is a family of strolling blackguards in Mr. Trollope's story, who have abundant opportunities of making themselves disagreeable to well-conducted neighbours in a thinly settled country; but they are, we should say, inferior in vigour to the ordinary British rough, and even when a fight comes off, the only weapons used appear to be big sticks. In this matter, however, we have observed that Mr. Trollope is generally rather hampered by his determined realism. When a fight takes place in his pages, we never have arms slung out with mighty force from the hip, nor men falling like oxen before the deadly fists of the modern gladiator; the fight always becomes a confused scuffle in which black eyes are the worst damage inflicted, and which the police are pretty sure to bring to an undignified conclusion. The likeness to real life is much greater, though possibly the gain in reality may not always counterbalance the loss in picturesque. Another marked difference between Mr. Trollope and Mr. Kingsley is in the descriptions of scenery. Mr. Trollope gives us a bush-fire and some weather of which we can hardly read without a desire to be sitting in our shirt-sleeves. There is certainly a chance for the art of what is called word-painting. But Mr. Trollope never yields to the temptation. We cannot say, in fact, that we ever get from him as from his predecessor any vivid picture of the external aspect of the country. We seem to have passed through it with the eyes of a farmer rather than of a poet or a naturalist. We perceive in what respects it is likely to be suitable for sheep; we think of the forests as a very awkward impediment to a rapid rider, and of the great heat as likely to produce very awkward fires in certain conditions of the weather. But we do not in the least know what are the prevailing tints of foliage or lawn; what the streams resemble when half-dried, or filled by a sudden rain, or how the storm gathers or the lightning flashes during a summer Christmas. We hear of the effects of such storms upon the prospects of the farmer, but we do not see them as they would be seen by a landscape-painter. And in this respect we cannot say that we prefer Mr. Trollope to Mr. Kingsley. A few touches of scenery in the background would have helped to transport us more distinctively to the Australian bush. To mention one other trifling fact, we have a vivid recollection of certain scenes in *Geoffrey Hamlyn* where Mr. Kingsley described with a great deal of genuine humour the behaviour of certain children and of the animal pets at a station. Here, again, such scenes are conspicuous by their absence in Mr. Trollope's writings. We are vaguely told that there are some children about the place; but they are kept in the background as rigidly as in the best regulated of English families. We hear, indeed, so little of them that we begin to think that their mother must have been rather unnatural; and as for animals, we do not even catch sight of the tail of a kangaroo or hear the remotest echo of the cry of a "laughing jackass." We fear that Mr. Trollope looks at such matters with the eye of a sportsman, and as he does not happen to introduce any hunting scene, he cares nothing for animals which only interest a naturalist. Now Australia is in our minds so firmly associated with the kangaroo, the ornithomynchus, and other living curiosities, that we are inclined rather to resent their absence. On the whole, we may say that there is a distinct want of those little touches of local colouring which do so much to place a new and strange country before us.

On the other hand, we must add that, if we were drawing a formal parallel between Mr. Kingsley and Mr. Trollope, we should have to state the contrast very differently when we come to the most important figures. Mr. Trollope's hero is, we have said, a thorough young Englishman. He belongs to a type with which we have become tolerably familiar in Mr. Trollope's varied writings. He is a strong healthy young fellow, with no sort of nonsense about him. He was, says Mr. Trollope, called firm by his friends, obstinate by his acquaintance, and pig-headed by his enemies; and if we add that nobody could call him a genius or deny him to possess a good share of common-sense, we have perhaps described him sufficiently. He is perhaps a commonplace young man, but then he is the kind of young man whom we could wish to be a good deal commoner. Mr. Trollope has a very skilful hand in depicting such heroes, and the skill is not the less remarkable because it is perfectly unobtrusive. His good young men have all the merits of the muscular Christians without being offensively demonstrative of their virtues. They are not at every moment flourishing their faith in Providence in our faces, and declaring in the most emphatic language that they are perfectly simple-minded and free from self-consciousness. They are a good sturdy breed, admirably well qualified to do their duty as country gentlemen, or farmers, or backwoodsmen. Wherever you drop them they will fall upon their feet, though it may be as well not to ask them to make too great a use of their brains. And the young women are like unto them. Some people are great admirers of Mr. Trollope's heroines. We confess that they have the merits of healthiness and good feeling, though we must add that, for our own private tastes, we should prefer a little more intellectual refinement. They are ladies; but they are a little too easily satisfied with the plain bread and butter of everyday life. However, nothing can be better adapted for life in the bush, where your next neighbour is at a distance of ten or

* *Harry Heathcote of Gangoil*. By Anthony Trollope. London: Sampson Low & Co. 1874.

twenty miles, and a taste for polished society would be as much out of place as a love of wild scenery in London. The actors in the little story are marked with sufficient distinctness and excellently suited for the part they have to play. The story itself is constructed with more than Mr. Trollope's usual skill. He has rather a provoking habit of running two or three plots together in his more ambitious performances; and thereby giving a rather perplexed effect to the whole. Here he has confined himself within the limits of a single volume, and any such deviations from the main thread of the narrative are therefore excluded. The situation in fact is simple in the extreme. Young Mr. Heathcote has a large run and is in a fair way to make money if he can only bring his wool to market. His danger consists in the fact that any chance fire about Christmas-time, when the grass is parched to tinder, may spread beyond control, ruin his pastures, destroy his woolshed, and force him to sell off his stock to meet his liabilities. Now Mr. Heathcote being, as we have seen, an obstinate and rather imperious young man, has made enemies of discharged servants and idle squatters in the neighbourhood. They have the opportunity of revenging themselves at any moment when lighting their pipes. They have only to drop a match at the right spot and the whole place will be in a blaze. When we add that he has taken a particular dislike to a neighbouring gentleman who has bought a piece of land in the middle of his run, and that the said gentleman has fallen in love with a sister-in-law who lives in Mr. Heathcote's house, we have said enough to show that the commonplace events of Australian life may furnish materials for a very pretty complication. We will not give any indication of the mode in which it is worked out; but we may conclude by saying that lovers of Mr. Trollope's stories may have a pleasant hour's amusement in turning over the pages of this unambitious but thoroughly satisfactory little story.

GENERAL JOHNSTON ON THE AMERICAN CIVIL WAR.*

GR^{EAT} events in Europe have so rapidly succeeded each other of late years as to blot out of men's minds very much of the remembrance of the not less great events in America on which our attention was fixed but a decade since. There are many of our readers who are fairly enough informed as to foreign politics to whom the name of General Johnston will bring no more distinct idea than that he was one of many officers of the old United States army who turned their arms against the Union and led large bodies of Confederates to overthrow it. Grant and Sherman on the one side, Lee on the other, have so overshadowed with their renown all lesser American commanders, European wars have by their very nearness so obscured our sense of the great Transatlantic struggle, that it may be difficult to find English readers who will care to follow the details which General Johnston publishes of his own campaigns. Yet these cannot be said to be of slight political or military interest. It was Johnston who won that memorable victory of Bull Run which first fully awoke the attention of the world to the magnitude of the issues involved in the election of President Lincoln. When McClellan many months later repeated the attempt to march on Richmond in which McDowell's undisciplined volunteers had failed, and repeated it with 100,000 trained soldiers, led by an elaborate staff in which princes were proud to serve, it was Johnston who met and checked him first, on the historic Yorktown ground. When the approaching fall of Vicksburg, due to Grant's well-designed strategy and soldierly perseverance, threatened the loss of the great river which would thenceforward sever the young Confederacy in twain, it was Johnston, scarcely healed of the wounds received before Richmond, who was despatched, all too late, to repair the mistakes of lesser men and strive to save the great stronghold of the Mississippi. It was Johnston who was selected, after Bragg's failure in the centre of the Confederate line, to meet Sherman, then already rising towards the zenith of his reputation as an elaborate, yet daring, strategist. His removal from this command by a misjudging President gave Atlanta to the Federals, and opened Sherman's way to the great march through Georgia which fatally revealed the inner weakness of the Confederacy. Finally General Johnston was recalled to lead, and at the very last to surrender intact, when all hope of resistance was over, the chief army left to the South when the gallant defenders of Richmond succumbed to overwhelming forces. In fact, next to the three names already mentioned, this commander unquestionably brought the highest reputation out of the long war. And the pages which, in the simple and sufficient words of his preface, he offers "as his contribution of materials for the use of the future historian of the war between the States," can hardly fail to be of service to those who view the subject as either interesting reading or profitable study.

It is unfortunate in a twofold sense that General Johnston did not undertake his task earlier. He not only would probably have found more readers had he issued his volume whilst his name and the events he describes were fresher in men's memories, but he might also have been saved from a very serious mistake which mars the whole course of an otherwise valuable and assuredly very able narrative. Though a really great commander, the writer has undoubtedly been placed in the world's estimate below the heroic leader who succeeded him in charge of the Army of Virginia. It was no fault of Johnston's that self-exposure in his first general

action with McClellan led to his being severely wounded, and thus superseded. Unfortunately he himself cannot forget the loss of opportunity, and the reader of his narrative is at more than one point made painfully sensible of an effort to depreciate the great chief whom fortune placed in his stead between Richmond and its assailants. Nor does the ex-Confederate General deal wisely for his own reputation when he undertakes from time to time to answer various attacks made on himself in the press, or on the platform, or in fugitive works of no authority. To turn aside from relating, and relating well, events of real historic importance, in order to refute in detail statements made by a Richmond journalist in a leading article, or by a Confederate War Secretary in a forgotten despatch, or by another author in the pages of such a contemptible biography as Dabney's *Life of Jackson*, is a great mistake artistically. It will not improbably cause many readers to underestimate the military genius of the author who is so jealous of his own reputation, and so ready to admit disparagement of rivals into his pages. With this remark as a general necessary warning which applies to the whole tone of the book, we pass to examine its view of one of the chief of those affairs in which Johnston bore so distinguished a part.

Five times, as we have seen, the events of the war brought his name into prominence. Our space will not permit us to go separately through these episodes, which are all voluminously, though by no means prosaically, told by the chief actor. That of Bull Run, which we select from the rest, is nothing short of an admirable example of what a military narrative should be—sober without dullness, and vigorous without any touch of extravagance. Even here, however, we are made uncomfortably conscious of the author's peculiar bias, by what seems too much like an attempt to depreciate one of the mightiest champions of the cause for which Johnston fought; so careful is he to explain that Jackson's brigade was lying down, by its general's orders, to await the enemy's artillery, when it received that historic praise from General Boe which gave its commander the name of "Stonewall" for the rest of his career. Passing by such blots, the account deserves close study. Among the novel points brought out is the smallness of the loss—that of the Confederates, who had hardly any "missing," being under nineteen hundred, all told, after a really obstinate and prolonged action, fought at very close quarters and against superior numbers. The inference of course must be that the firing of their adversaries was singularly wild.

The simple way in which the latter lost the fight is too characteristic of raw troops not to afford a useful lesson. As Johnston clearly shows, such tactical combinations as were designed on his side broke down altogether. The Confederate brigades were far too undisciplined, and their commanders too new to their duties, to answer the impulse intended to be given them by their chief. McDowell's simpler movement, the using his superior numbers to turn that flank of theirs which lay towards the Shenandoah, from which he rightly judged their reinforcements to be coming, succeeded perfectly up to a certain point. The Confederate left was beaten back, and, being unsupported, would undoubtedly have been driven in but for Jackson's personal exertions; for this was the occasion on which that general first displayed the wondrous gift for leading men in action which Johnston fully admits. Once checked, the Federals, though in greatly superior numbers, could not again be got forward, a fact which those who have served with undisciplined troops will be fully prepared for. They had lost all such orderly formation as had been intended, and their very numbers now only confused them. Brigade after brigade of Johnston's men (the battle was begun chiefly by Beauregard's hitherto separate force) now came in from the Manassas railroad. Those who first arrived supported Jackson, and soon enabled him to recover his lost ground. They were followed by that of Early, the same general who took such a leading part in the last year of the Virginian campaigns, and who seems to have deserved thus soon a higher reputation than fell to his share until Lee singled him out for detached command. The rest of the story may be given in the narrator's own clear sentences:—

In the meantime Colonel Early came upon the field with his brigade. He was instructed by me to move around our left, to form facing the Federal right flank, and fall upon it. On the way he was reinforced by five companies of cavalry, commanded by Colonel Stuart, and a battery. He reached the position intended just when the Federal army, reformed, was apparently about to resume the offensive, and assailed its exposed flanks. The attack was conducted with too much skill and courage to be for a moment doubtful. The Federal right was at once thrown into confusion. A general advance of the Confederate line, directed by General Beauregard, completed our success, and terminated the battle. The right of the Federal army fled in wild confusion from the field toward Sadley Ford, while the centre and left marched off hastily by the turnpike toward Centerville. It was then twenty minutes before five o'clock.

It would be an instructive lesson to compare Johnston's unvarnished account of the flight and pursuit that followed with the celebrated picture of it in the *Times*, which brought so much odium on Mr. Russell, and led to his retirement from his duties. Our author, no doubt, has in view the charges afterwards heaped on himself by "the non-combatant critics" who condemned his partial use of his victory, and the want of energy which prevented his reaping the fruits of it in the capital. Of course, therefore, he is not careful to put the moral state of his enemy at the lowest; whilst the English writer, with an eye to pictorial effect, made the most of the ugly features which mark every panic of a large armed body. The truth lies undoubtedly somewhere between the two. And if Johnston is successful in show-

* *Narrative of Military Operations during the late War.* By General Joseph E. Johnston, U.S.A. New York: Appleton.

ing that the dangers of attempting the capture of Washington have been underrated by his critics, he fails, in our view, to make good his case as to the inexpediency of pushing the pursuit at all towards that city. It is quite true that his horse were inadequate for this; and not less true that, as he states, infantry cannot overtake infantry who are determined to get away from them. But it by no means follows that it would not have been possible to push the Federals at once within the lines already prepared to cover the capital; or that they would have certainly stood to these had the pursuit been thoroughly carried on. Johnston's real defence here is in the conduct of his own troops, of whom he says:—

They were disorganized by victory more than those of the United States by defeat. The Southern volunteers believed that the objects of the war had been accomplished, and that they had achieved all that their country required of them. Many therefore, in ignorance of their military obligations, left the army—not to return. Some hastened home to exhibit the trophies picked up on the field. Others left their regiments without ceremony to attend to wounded friends, frequently accompanying them to hospitals in distant towns.

We are sure that these statements, which rest on official reports, are strictly correct, and that exaggerated ideas of the victory cost the Confederates more men than the Federal army lost by defeat. But when all this is stated it by no means settles the question in favour of the author's view, nor proves that a steady advance would not have been the very best means of checking for the time that tendency to disperse which clearly did not manifest itself until the halt was fairly declared. It seems quite as probable that the elation of pursuit might have supplied for the hour the lack of discipline. As to the alleged want of provisions, the Federals were hardly in a condition to defend their own convoys and depôts; and their supplies were at any rate never abundant. Napoleon, the greatest reaper of victory the world ever saw, never stayed pursuit for this difficulty, which indeed attaches naturally to all pursuit when hurried.

The whole of this story of Bull Run is a most instructive lesson, especially to us who are maintaining large forces of Volunteers and of voluntarily raised and ill-trained Militia. It would have been a priceless lesson, because unique, had it not been that Grant has been so good as to repeat the same sort of incidents in those actions on the Loire for which he is blamed and admired according to the political predilections of his critics rather than their military knowledge. But, though we have thus dwelt on this particular part of the history, it is but just to add that Johnston's narrative is at other points hardly less interesting, or his defence of what he did or left undone less able. His book is truly a most valuable "contribution to the history of the war." We regret only that it is marred by a controversial and carping spirit, which, while showing the critical powers of the author, leaves the reader possibly more prepossessed against him than the same story would do if told by any other hand than that of the able commander who seems so over-careful of his own reputation.

AKBAR, THE GREAT MOGUL.*

A NEW translation of this celebrated work has made its appearance almost simultaneously with a new volume of Sir H. Elliot's History, in which the events of the greater and most important part of the reign of the Emperor Akbar are narrated in much detail. The two books together supply ample materials for a study of the character and institutions of this famous Emperor, the greatest of all the Mahomedan rulers of India. His reign extended from 1556 to 1605, corresponding exactly with that of Queen Elizabeth; and not in point of time only, for it was in every way the most brilliant era in the annals of India. The history of this reign occupies a prominent place in all the general histories, but it is derived almost exclusively from three contemporary writers—men of different positions, characters, and feelings, who surveyed the character of the monarch under various lights, and have handed it down to posterity painted in hues more or less bright. Nizami-ud-Din, a plain straightforward soldier, has written the history of the first thirty-eight years of the reign up to the time of his own death, in a manly simple style. Abd-ul-Kadir, or, as he is called from his birthplace, Badáuní, adopted this history, interspersing it with observations and opinions of his own. He was a literary man of some ability, and envious of the prosperity of more fortunate authors; bitter against the Emperor for the little patronage he bestowed upon him, and as a bigoted Mahomedan especially rancorous over the Emperor's wandering from the fold. Large portions of these two historians appear in Sir H. Elliot's volume. The third writer was the Emperor's friend and Minister, Abú-l-Fazl, the Court historian, whose bulky work, the *Akbar-nama*, as yet untranslated, is very eulogistic, and has been severely condemned by Europeans for its fulsome flattery. But it is a great work, and as an Oriental production it hardly deserves the censure it has received. Whatever may be thought of it, there is no second opinion as to the merits and value of his other work, the *Ain-i-Akbari*, two books of which out of five have been translated by Mr. Blochmann. This is the greatest and most enduring monument of Akbar's reign, and would establish his title to be numbered among the wisest and greatest of sovereigns had every other record of his history been swept away.

The chivalrous Baber, after several unsuccessful attempts upon

India, captured Delhi in 1526 A.D., and for the rest of his life was actively engaged in pushing his authority southwards. But his early death four years afterwards put an end for the time to Mogul ascendancy. His son and successor Humáyún, though personally brave, was of an easy, generous temper, and inclined to pleasure. He had several brothers, each of whom endeavoured to set up for himself, and to seize as much as he could, quite heedless of the wrongs inflicted upon their brother, and of the weakness to which they reduced the Mogul throne. Tyrants who have swept from before them all probable competitors to the crown have found in the case of Humáyún a warrant for the course they have adopted. Continually harassed by his brothers, Humáyún was unable to repress the revolts against his rule. The dynasty overthrown by Baber was of Afghan extraction, and now Sher Sháh, a man of that nation, prudent, bold, enterprising, and unscrupulous as to the means by which he won success, defeated Humáyún in two great battles, and drove him out of India. Sher Sháh and his son by their able administration retained the throne for their lives during a period of thirteen years. Then came a profligate successor, and the way was opened for the return of Humáyún. In 1555 A.D. he crossed the Indus, defeated the Afghans, and recovered the throne he had lost fifteen years before. Only six months afterwards he fell over the parapet of his palace and met his death.

Humáyún was succeeded by his son Akbar, then but just over thirteen years of age. Akbar was born at Umarkot, in the desert of Sind, when his father was a fugitive, and he received the names of Jahál-ud-din Mahomed Akbar. Half of this name—"the Glory of the Faith"—proved in the end to be singularly inapplicable, but he would have won the title of Akbar (great) even if it had not been thus early given to him. Fortunately the young monarch had an able guardian and Minister in the person of Bairám Khán, an old friend of his father's. Though defeated, the Afghans were not vanquished, and they had found a heaven-born general in the person of a Hindu corn-chandler named Hímú, who for a time swept all before him, and occupied Agra and Delhi. Bairám Khán and Akbar met him on the plains of Panipat, where the fate of India has been so often decided, and Hímú was defeated, wounded, and taken prisoner. Bairám Khán urged the prince to kill the prisoner, and win the merit of slaying an infidel. But, said the youth, "he is little better than a dead man, how can I strike him? If he had sense and strength left I might try my sword." The stern guardian had no such generous scruples, and instantly cut down the helpless prisoner. Valuable as were the services of Bairám to the youthful Akbar, the Minister's power did not endure for long. He had been the chief agent in re-establishing the Mogul throne, but he was proud and haughty, and had many enemies. His power was too great for a subject, and the young prince was not of a nature to yield to the guidance even of one for whom he felt the highest esteem and gratitude. When Akbar was eighteen the Minister received intimation to retire. Enemies and injudicious friends worked upon his wounded feelings until he took up arms against his master, but, after showing in a sharp battle all his old ability and courage, he was made prisoner and conducted to Court. When he was brought into the presence of the Emperor the true nobility of the young monarch shone forth. The recollection of old affection and long service quenched the anger excited by the late rebellion. He received his fallen Minister with every mark of respect, loaded him with gifts, and offered him a splendid provision in retirement. But the great man's pride had been too deeply wounded, and he expressed his determination to perform the pilgrimage to Mecca. Ample provision was made for his journey, but before he reached the coast he was assassinated by an Afghan. He left a son, quite a child, whom the Emperor took under his special care and brought up. When this child grew up he showed considerable ability, and under his master's favour he rose to the dignity his father had held before him, and became *Khan-Khánda*, or premier noble of the State.

Left to his own guidance, Akbar at once exhibited that distinctive mark of greatness, the choice of able and fitting officers for carrying out his views. Though at this time a sincere Mahomedan, he offended the bigots of his religion by the toleration he extended to his Hindu subjects, by the alliances he formed among their nobles, and by the friendship he extended to those who served him. Chiefs who at first resisted him were defeated and won over, those who had been his opponents became his devoted servants; they led his armies to victories in the field, and to even greater triumphs in civil administration. From the first he endeavoured to prove that he was no foreigner, and that he ruled for the interests of no particular creed or party. Ability and honesty were sure of his favour, whether the owner of them was Muslim or Hindu. This conciliatory spirit which he displayed towards his Hindu subjects was of the greatest service to his throne, and had a powerful influence in the extension and consolidation of his dominions.

Akbar was a man of great personal courage and bodily activity. More than one gallant deed is recorded of him; his endurance as a pedestrian was shown on many occasions, and the extraordinary rapidity of his journeys in times of danger struck his foes with amazement and dismay. He was an able soldier in the field, a skilful director in a siege; he never met with defeat in battle, and never retired baffled from a fortress, although he had to deal with some of the strongest in India. In the early part of his reign he had some hard work in repressing several great nobles who rebelled against the restraints imposed upon them by his vigorous Government. His old foes the Afghans retired eastward and gave him

* *Ain-i-Akbari* by Abú-l-Fazl 'Allami. Translated from the Original Persian by H. Blochmann, M.A., Calcutta Madrasah. Vol. I. Calcutta.

many a severe struggle before he could reckon Bengal and Orissa as his own. In Malwa and in the West he had incessant conflicts with the Rajput princes. Lower down he conquered Ahmedabad, Surat, and the dominions of the Kings of Guzerat. Later on he acquired the territories of the Mohammedan rulers of Ahmednugger. On the North he conquered Cashmere. So that at his death his dominions extended from Cashmere and Candahar on the North to the coasts of the Bay of Bengal, to Ahmednugger, South, in the Deccan, and to the coast of Guzerat on the West. One great disaster happened to his arms, in the same country where his English successors suffered a dire reverse two centuries and a half afterwards. His generals led his armies into the mountains of Swat against the Yusufzai Afghans, who encountered them in the defiles and cut them up with a loss of 8,000 men.

In his family relations Akbar was kind and amiable. His younger brother who obtained Cabul invaded his territories and showed anything but a brotherly feeling, but, although overpowered, he was treated with great lenity. His nurses and his foster-brothers were raised to wealth and dignity, and his own mother received from him the greatest veneration. When she died at a good old age he was deeply affected, and as an affectionate son he discharged the pious duty of placing his own shoulder to her bier and assisting to bear it for some paces. He was not happy in his children. Two of them died before him from excessive drinking, and Jahangir, who succeeded him, and who endeavoured to supplant him in his lifetime, was also an excessive drinker. The accounts given of his potations are almost incredible, and nothing but an iron constitution could have saved him from becoming an early victim to this vice.

The *Ain-i-Akbari*, or Institutes of Akbar, now translated afresh by Mr. Blochmann, was translated into English at the close of the last century by Gladwin. His version, though very meritorious for the time, was imperfect and often incorrect. The wonder is that it was so good as it was, for the work abounds with technical and obscure terms; and in the opinion of native writers the style is not intelligible to the generality of readers without great difficulty. The translation now presented to us exhibits the most careful labour and critical scholarship, and it is illustrated with elaborate notes which testify to the wide reading and diligent research of the author. The work is divided into five books, "and is in fact an Administrative Report and Statistical Return of the Government as it was about 1590, A.D." Abul Fazl's official position gave him full possession of all the materials necessary for the compilation of such a work, and it is evident that although many hands must have worked upon it, the whole was designed, moulded into shape, and revised by one governing spirit:—

The first of its five books treats of Akbar's household and Court, and of the Emperor himself, the soul of every department. . . . The second book treats of the servants of the throne, the military and civil services, and the attendants at Court, whose literary genius or musical skill receives a lustre from the encouragement of the Emperor, and who in their turn reflect a brilliant light on the Government. The third book is entirely devoted to regulations for the judicial and executive departments, the establishment of a new and more practical era, the survey of the land, the tribal divisions, and the rent-roll of the great Finance Minister (the Hindu Raja Todar Mal), whose name has become proverbial in India. The fourth book treats of the social condition and literary activity, especially in philosophy and law, of the Hindus, who form the bulk of the population, and in whose political advancement the Emperor saw the guarantee of the stability of his realm. There are also a few chapters on the foreign invaders of India, on distinguished travellers, and on Mohammedan saints and the sects to which they respectively belong. The fifth book contains the moral sentences and epigrammatical sayings, observations, and rules of wisdom of the Emperor, which Abul Fazl has gathered as the disciple gathers the sayings of the master.

The matters relating to the mint and coinage come very early in the work. The various officers and workmen are named, their duties are detailed, and the pay of each is specified. The various methods of testing the purity of the metals are then described, next the processes of refining, and then the mode of extracting silver from gold. All this is done in minute detail, and illustrative drawings are added exhibiting the various workmen engaged in their respective operations. Next comes a description of the various coins, specifying the shape, weight, value, and legends of each. Lastly, the allowance to be made for deterioration of the coinage by wear and tear. Every department, both public and private, is gone through in the same exhaustive manner. The general arrangements of the Imperial kitchen are described; then follows a list of recipes for dishes, and priced lists of the various provisions, preparations, and fruits, forming a complete price current of the time. The royal stables for elephants, horses, camels, and other animals are passed under review, and the accounts exhibit a minute acquaintance with the habits and peculiarities of each. Circumstantial particulars are given respecting the gestation of the elephant, which can only have been arrived at by many post-mortem examinations. The second book contains the regulations relating to the army in every branch, to hunting, to amusements, and many other subjects too numerous to notice. We will only extract a notice of the Imperial harom:—

The large number of women—a vexatious question even for great statesmen—furnished His Majesty with an opportunity to display his wisdom. . . . He has made a large enclosure with fine buildings inside where he reposes. Though there are more than five thousand women, he has given to each a separate apartment. He has also divided them into sections, and keeps them attentive to their duties. Several chaste women have been appointed as superintendents over each section, and one has been selected for the duties of writer. Thus, as in the Imperial offices, everything is here also in proper order. The salaries are sufficiently liberal. Not counting the presents which His Majesty most generously bestows, the women of the highest rank receive from 1,600 to 1,028 rupees per mensem. Some of the servants have

from fifty-one to twenty, others from forty to two rupees. . . . The inside of the harom is guarded by sober and active women; the most trusty of them are placed about the apartments of His Majesty. Outside of the enclosure the eunuchs are placed, and at a proper distance there is a faithful guard of Rajputs, beyond whom are the porters of the gates. Besides, on all four sides there are guards of nobles, guardsmen, and other troops according to their ranks.

The last section of the present volume contains lists of the grandees of the Empire, the learned men of the time, the poets, and the Imperial musicians. The list of grandees comprises 415 nobles, and Mr. Blochmann has collected from different sources a great amount of information respecting them, so that the list has been expanded into a Biographical Dictionary and Complete Peerage. The notices of the learned men are, from the scarcity of the materials, much more brief. In the notices of the poets Abul Fazl has given many specimens, which Mr. Blochmann has translated into prose. At the head of the poets stands Abul Fazl's own brother Faizi, who is even now reputed as the second poet of India. In introducing some specimens of his brother's composition the author thus gracefully refers to them:—

Should leisure permit, and my heart turn to worldly occupations, I would collect some of the excellent writings of this unrivalled author of the age, and gather with the eye of a jealous critic, yet with the hand of a friend, some of his verses. But now it is brotherly love—a love which does not travel along the road of critical nicety—that commands me to write down some of his verses.

Mr. Blochmann has also collected numerous passages relating to the religious opinions of Akbar, and this is so curious a matter that we propose to notice it on a future occasion.

The second volume of the work will be even more interesting than the present one, for it will contain the regulations for the judicial and revenue administration of the Empire. The revenue settlement was made under the direction of the celebrated Hindu financier, Raja Todar Mal. The name of this Minister is still familiar to all concerned in the land revenue of India, and his *Tinadr Jama*, or Settlement Roll, is continually referred to as an authority. We wish Mr. Blochmann good speed in the completion of his work.

LIFE OF JOHN CLOWES.*

ST. JOHN'S CHURCH, Manchester, for one hundred and five years—from its consecration in 1769 to May 1874—knew only two rectors. The first of these, John Clowes (born 1743, dying 1831), who occupied the incumbency sixty-two years, is the subject of the memoir before us. It is not, however, as a minister of the Church of England that it has been thought desirable to rescue his name from the common lot of oblivion, but as an ardent disciple of Emanuel Swedenborg, a translator of his works and exponent of his doctrines. It is not easy to understand why this endeavour, if made at all, was not made earlier, but we do not pretend to be in the secrets of the body whose interests are involved in the publication. Small sects must be excused if they make much of well-born adherents, and Mr. Clowes, of respectable family and highly educated, Eighth Wrangler and Fellow of Trinity, well received in society and commemorated by De Quincey in his recollections of his boyhood as "holy, apostolic, the most saint-like of all human beings I have known through life," is a name which naturally they would not willingly let die out of their annals. Yet, for want of a capable biographer, there seemed danger of this. A certain Mr. Harrison, a fellow-disciple, and at the same time a member of the Society of Friends, had indeed collected materials immediately after his death, but modestly left it to others to make a picture of his sketch. No personal acquaintance of Mr. Clowes having offered to do this, the present editor has complied with the wish of friends who think the time has come when the life and sentiments of John Clowes will meet with candid and thoughtful consideration.

We cannot say that to ourselves Mr. Clowes's recorded thoughts and utterances, apart from his personal presence, carry much weight, or seem to deserve the effort made to perpetuate them; but, as a study, he himself illustrates in a marked manner the union that may exist between wild enthusiasm in things spiritual and worldly wisdom and tact in temporalities—a union also conspicuous in the great leader of the sect, Swedenborg himself. To almost any other man it would not have been easy to hold his benefice between the attacks of his orthodox brother clergy on the one hand and the provocations of his more eager co-religionists on the other, who were constantly urging upon him the duty of breaking away from a Church whose creed he repudiated. But, whether he was aware of this influence or not, his whole nature recoiled from sinking into the insignificance of a petty sect with its meeting-house in Great Eastcheap; and he was able without a moment's misgiving to reconcile duty, interest, and inclination. Bishop Porteus, probably unwillingly enough—for he had recently been engaged in a proposal to promote a review of the Liturgy and Articles in order to diminish schism and separation—was compelled to summon him to answer charges against doctrines preached from his pulpit. But he succeeded in smoothing away difficulties that were not then uppermost in the Bishop's mind; and so represented the Swedenborgian standpoint of "Christ the only God" (denying the doctrine of three Persons), as well as other points of difference, behaved towards his diocesan with so much deference, and caught the moment with such tact when the

* *Life of the Rev. John Clowes.* Edited by Theodore Compton. London: Longmans & Co.

Bishop had had enough of it, that he was dismissed with no other censure than a caution to be prudent and circumspect in his conduct, for he had enemies; not a very handsome way of putting it towards the orthodox party, if the epithet was so applied, of which we cannot however be sure. Whatever it was, this is all to be called "persecution" that Mr. Clowes ever received for his opinions from Churchmen. It is asserted indeed that many years after this, in 1804, Pitt offered him a bishopric. It does not do to accept such statements without investigation; but if the offer was made, it must have been in ignorance, and could not possibly have been accepted. The objections and arguments of those who called upon him to secede were still more easily settled; for, "pondering on the subject whether he should resign his cure of souls in order to devote himself to the translation of the eight quarto volumes of Swedenborg's *Arcana Cælestia*, he was made sensible of the presence of an angelic society from whom there seemed to be an internal communication, "Do not do it; we will help you." That the work was done very indifferently, in spite of this assistance, we are left to gather elsewhere from the editor's own admission; but if the angels once told him to keep his living, nothing more could properly be said to dissuade him from it.

The sudden transition from Clowes a Fellow and Tutor of Trinity to the Swedenborgian visionary is so strange that we may regret that nothing is told of the nature of the illness which brought it about. He himself, in an autobiographic notice written in the third person, speaks of a "process of bitter suffering," of an illness so alarming as to stop the career of worldly purposes, overturning all his projects of human greatness and leaving him prostrate in mind and body; but we can only guess what share the mind had in the collapse. It left him willing to accept the incumbency of the new parish church of St. John, which a year before he had declined as below his pretensions. He certainly seems to have regarded himself as remarkable on very small recorded grounds. "Perhaps," he says, "no Christian minister ever entered upon the sacred duties of his calling under circumstances more singular, and in some respects more apparently unpropitious. His theological researches had been very limited, and his religious views were accordingly very imperfect. He had indeed read the Thirty-nine Articles, and he had perused some of the more distinguished authors who endeavour to explain and confirm that code of doctrine. But this was all." A man must have a very decided turn for singularity who believes himself to be separate and apart from his fellows on these grounds alone. He threw himself into his studies with energy, however, till a glance into Law's *Christian Perfection* and a further study of that author led him to the perusal of other mystical writers. With these he was satisfied till, "visiting a gentleman of Liverpool possessed of an ample fortune and leisure, he was introduced by him to the writings of Swedenborg."

It was this gentleman, a Mr. Houghton, who informed Clowes that John Wesley, when on a visit to him, had, shortly after the death of Swedenborg, "declared to him in the most solemn manner that we might burn all the old books of theology, for God had sent a teacher from Heaven, and in the writings of Swedenborg we might learn all that is necessary for us to know." We quote this as showing how unsafe as mediums of information are all visionary enthusiasts. For Wesley's real opinion of Swedenborg may be gathered from his account of him in the *Arminian Magazine* for 1783, quoted by Mr. White, Swedenborg's recent biographer. After giving an account of the "Baron's" visit to England, when he lodged at one Mr. Brockmer's, in whose house he had a violent fever, "Wesley goes on to relate that in the height of this fever, being totally delirious, he broke from Mr. Brockmer, ran into the street stark naked, proclaimed himself the Messiah, and rolled himself in the mire," adding, "I suppose he dates from this time his admission into the society of angels. From this time we are undoubtedly to date that peculiar species of insanity which attended him, with scarce any intermission, to the day of his death." Mr. Clowes did not, however, read the work recommended to him by this friend of ample fortune till, in the autumn of the same year, when on a visit to the Right Honourable John Smyth, he opened the long-neglected volume and happened to cast his eye upon the term "*Divinum Humanum*"—words which a few days later threw him into "a vision of Divine glory visible to the senses, repeated at intervals, and kindling in him an ardent desire to peruse *Vera Christiania Religio*":—

The perusal of the *True Christian Religion*, the last of Swedenborg's works, was speedily followed by that of his treatise on *Heaven and Hell*, the exposition of the Books of Genesis and Exodus entitled *Arcana Cælestia*, the *Apocalyptic Revelata*, and the treatises on the *Divine Love and Wisdom*, *Divine Providence*, and *Conjugal Love*. These voluminous works, with other minor tracts by the same author, were successively read, or rather devoured, says the autobiographer, and as constantly excited wonder, delight, and edification.

We need not tell our readers that many of Swedenborg's writings are anything but edifying to the uninitiated. Some were indeed pronounced by Swedish authority unfit for publication; but there is always a way of getting over such things. To Mr. Clowes Swedenborg was the sun, all other teachers being at best but stars and moon.

We have gathered that the progress of his acquaintance with Swedenborg was under distinguished patronage; it naturally follows that the converts Mr. Clowes was most solicitous to make were all from the higher classes of society. He is indeed assumed to be the apostle for these circles, for we read of a "gentleman of

landed property in Cheshire who distinctly heard in the night a voice saying 'Go to Mr. Clowes.'" He writes to a friend in 1808:—

In the course of last month I spent a charming fortnight with my friend Mr. H—, who married a sister of Lord Derby, and both he and his lady, and a numerous family of young ladies and gentlemen, are devout receivers of the New Jerusalem.

The editor does not venture to confirm this statement, but owns that the effect of his teaching was too much like that of a popular sermon; but it tells something for charm of manner, and perhaps a sort of eloquence, that a strong impression was produced; and of course, unless the name of Swedenborg was given, his hearers may not have been at all aware what he was teaching. One of Mr. Clowes's correspondents is a widow lady in some way connected with the Court. To her he writes, 1809:—"You do not say whether you communicated any of our enlightened author's works to the young Princesses. Perhaps it might not be prudent; but still it appears to me that their piety might possibly be confirmed by such communications. I shall esteem it as a particular favour to be indulged with what further intelligence you may receive on this interesting subject." However daring a man may be in the introduction of startling doctrine and new light, there is no escaping the spirit of the age we live in. Mr. Clowes's loyalty recalls the day when kings and courts were shrouded in a glory and mystery which royalty has since taken pains to dispel. His reflections on the sad condition of George III. are of the tritest to our ears, but may have conveyed to those he addressed ideas which they would hardly have hazarded on their own account. "What you say of the Royal Family," he writes, "and particularly of the King, is most affecting, and presents us with many edifying and important lessons. For how convincing is it, that no station here below is exempt from trial and trouble, and that neither the bars nor the guards even of a palace can keep out affliction." This tone towards rank falls in with the spirit of the founder of the sect. Swedenborg had a king (Charles XII.) for his patron, and it was through his father's persevering importunity that the family got ennobled. Hence the title of Baron, so fondly given by his followers, though we believe the act of ennoblement confers no title, but only a seat in the House of Nobles in the Swedish Diet, which consists of 2,000 members.

Mr. Clowes's qualities were such as exactly fitted him for the double part he had to play. He was a visionary, but with no turn for extravagance in conduct. No man has a fine person and manner without being influenced in conduct by them. The gift of pleasing tells both ways. Swedenborg was the reverse of ascetic, and Mr. Clowes's own nature was genial and indulgent. He had, it seems, in youth nearly fallen a victim to the attractions of a lady afterwards well known in Scotch literary circles—Mrs. Fletcher, mother of Lady Davy; but found out in good time that she was already engaged. For the remainder of his long life he was content with the general good will of the sex, by whom he seems to have at once been petted and revered. He was the sort of man to receive addresses and presentations from all parties. Thus we read on the occasion of the sect's meeting at Hawkestone, the seat of Sir Richard Hill, on their first annual gathering, that the two youngest ladies of the company presented him with a golden cup and cover in commemoration of his translation of the *Arcana Cælestia*; while his parishioners were not behindhand with their testimony to his merits, presenting him with his own portrait and a tablet by Flaxman (also a Swedenborgian), in which the rector is represented instructing a group of children. There is one characteristic of a sect which Mr. Clowes could not escape. The jokes of small sects are small, and his are of the smallest. The following "smart sally" might, we think, have slept the sleep which is the common doom of wit. "This is excellent tea," said one of the party to the lady who was presiding, and who had lately been Mr. Clowes's companion and housekeeper. "Yes," said he, giving her a significant look. "Mrs. U. makes very good tea—at an inn." Then, recollecting that he might be thought to have gone too far, he added, "Aye, and in her own house, too." Nor are they always as free from vulgarity as this innocent specimen:—

I remember an argumentative spinster, ripe in years, who had been addicted to Calvinism, and puzzling herself by dipping into Swedenborg's works, was anxious to state her perplexities to Mr. Clowes. Her voice being strange to him, and consequently inaudible, another lady, who had his ear, kindly interposed, informing him that Miss — wished to tell him that she had been pleased with the treatise on *Heaven and Hell* until she came to the statement that Heaven is in the human form, and is called the *Grand Man*. Turning instantly towards the inquirer, he said, "Ha! you did not like a man, I suppose?" This was delivered in a tone so comic, and with a look so playful and arch, as to be quite irresistible. An uncontrollable laugh burst from all sides.

While giving at full length De Quincey's recollections of Mr. Clowes, the editor allows us to gather that in his estimate of character, as well as in his notion of Clowes's extreme age at the time of their interview, De Quincey was mistaken. Instead of being eighty in 1802, he was only sixty-nine, and, so far from leading the life of a hermit, he was open to all the pleasures of society. It is rather an amusing illustration of an opium-eater's memory to find him describing with somewhat tumid eloquence the stained glass of the library where their last meeting took place, when it turns out that the library never had coloured windows at all. Some painted glass had been sent to Mr. Clowes by a grateful refugee and put into a church window. Its "grand emblazonries" were in keeping with the "venerable figure and saintly countenance" which he pictures, and he saw them not where they were, but where they ought to have been. Still we think it illiberal in

the editor, after taking full advantage of a record so important to the present fame of his subject, to hint that probably Mr. Clowes thought the bookish boy somewhat of a bore.

MR. SMITH.*

IT would save not a little awkwardness to the reviewer if every new writer were to hoist his colours at once and say to what sex he belongs. Women, when they take to writing, so often affect a masculine style, so often deal with subjects which once were left entirely to men, that it has become no easy matter to decide whether an author is male or female. The critic has often no help for it but to settle the point at a guess, unless indeed, by a careful avoidance of pronouns and the use of the common term "author," he can escape committing himself to an opinion either way. It would be very convenient, however, as long as this affectation of mystery prevails, if a short Act were passed to the effect that, in all reviews of books, wherever the word "he" occurs it shall be understood also to imply "she." In the case of the novel before us we are not a little perplexed on this very point. We rather incline to the opinion that it is written by a lady. As we have no certainty about the matter, we shall nevertheless, out of respect to the rule of the old grammarians, assign it to the more worthy gender. Mr. L. B. Walford then has written a story which, though disagreeable, shows nevertheless a good deal of cleverness. There are too many bad people and too many vulgar people to make it very pleasant reading, though the hero is a good man and the heroine becomes a good woman. Like most other novels it is a great deal too long, for though it is published in two volumes, it could by the printer's art very easily have been made to fill three. In point of English it is certainly better written than the majority of the stories that come before us, though the author has his trips in language as well as the rest. He writes in one place how "an undercurrent gave a depth to the drama," and in another place how between the hero and the heroine "had arisen a sudden cloud—a cloud so thundery, so dangerous, so close at hand that she felt unable to cope with it, unless she had support." "It is hard," we read in another passage, "if a man may not have his pleasant-shooting because the girls are bad style." All writers of the present day, from the poets downwards or upwards, have so got hold of the word "supremely" that we hardly venture to object to it. It is, however, only within the last few years that a wife, like the Lady Sauffrenden of this story, has loved her husband supremely. The following paragraph, if not bad style like the girls, is at all events bad grammar:—

The consequence was, that in most places the frizzettes beneath were altogether laid bare; and that where this was not the case, they were only covered by thin streaks of hair, few and far between, and that hair being of a light sandy hue, very distinguishable from the framework.

The full title of the story, as our readers may have noticed, is *Mr. Smith: a Part of his Life*. We never knew a case of a hero of whose life an equally small part was told. Mr. Smith is introduced to the reader as a man of fifty. Of his earlier years we hear next to nothing, and he lives so short a while after the introduction that of his later life there is not very much to tell. The scene opens in a country village, where a large house has just been built and is only waiting for the arrival of its owner, Mr. Smith. Of him nothing is known, and great is the disappointment, nay, even the indignation, among the tradesmen when the news spreads that he is an old bachelor. The butcher heads the clamorous crowd and plays the part of the First Citizen. "There was rooms in the house," he said, "that ought to have been family rooms. There was rooms as meant roast beef, and there was rooms as meant saddles of mutton and sweetbreads." When Mr. Smith came down to occupy his house, the butcher recommenced his grumbling:—

What was a Mr. Smith to him? He didn't want no Mr. Smiths. Mr. Smith, indeed! Why, the very name Smith had a regular family sound.

A Mrs. Smith, a young Smith, the Miss Smiths, Bobby Smith, Jack Smith, Joe Smith, the Smith's baby, and the Smith's governess, seemed to him only the proper Smith connection.

In the village there were two sets of sisters who play a great part in the story. These were the three Miss Tolletons, who were pretty and clever, and the two Miss Hunts, who were plain and stupid. The five girls were alike in this, that they were all gifted with a wonderful amount of low cunning and unusual powers of lying. They were moreover all equally desirous of getting married. Their characters are drawn no doubt with a good deal of cleverness, and one of the five, the heroine, as we have said, gets better as the story goes on. But clever liars like the pretty Miss Tolletons, or stupid liars like the vulgar Miss Hunts, do not afford the most improving, or indeed the most pleasant, study. Helen Tolleton, the eldest of the three sisters, soon makes up her mind to win Mr. Smith, while Mr. and Mrs. Hunt, with even greater rapidity, make up their mind that the future Mrs. Smith shall be their daughter Maria. With a great deal of dexterity, the Tolleton girls manage to hoodwink Mrs. Hunt and to make her believe that it is Maria whom Mr. Smith is courting. He, however, in a grave middle-aged way has been greatly struck with Helen, and is utterly unaware of Mrs. Hunt's manoeuvring. As for Helen, the more she

sees of his simple honourable character the more she admires it, till at last she grows ashamed of the thoughtless follies of which she had been guilty. There was a wicked Colonel Aytoun with whom, when but seventeen years old, she had gone far in flirting. He is one of those unnatural monsters who happily only exist in imaginations that are not quite so wholesome as might be wished. Years before the story opens he had, "by his high-sounding name, his sparkling uniform, his fair moustache," won the affections of the lady to whom Mr. Smith was at the time engaged. He had proved a brutal husband, but, for the sake of his ill-used wife, Mr. Smith did not break off with him. The Colonel, having robbed him of his mistress, went on at cards and billiards to swindle him out of his money:—

Colonel Aytoun was rampant. He was not rich, but over and above the pleasure of having these reinforcements to a short purse, it was a most delightful occupation of his talents to take in the man to whom he bore no malice.

It was charming to be able to tell Emmeline of the last rise he had taken out of that simpleton—her lamented bridegroom; to wonder how she had really not been rather ashamed of selecting such an imbecile, barnacles (though he was; to suppose that it might have been a case of "birds of a feather;" and then to grin and jeer at her with his smiling red lips, and bid her go and seek the society of such a congenial spirit, for he was sick of keeping company with babies out of long cloths.

Mr. Tolleton, four years before the story opens, had taken his daughter Helen to visit at this monster's house, at the time when Mrs. Aytoun was confined by sickness to her room. Though Helen acted very improperly, yet as soon as she saw the man's utter wickedness she had insisted on her father's taking her home at once. Shortly after Mr. Smith had come to his new house and was beginning to pay attentions to Helen, Colonel Aytoun visits in the neighbourhood. He thinks he has a hold on her and can get her into his power. She meets his advances with spirit and indignation, and takes the best step possible by making an unasked-for confession to Mr. Smith of the follies of which she had been guilty in her girlhood. He forgives her, and would at once have proposed to her had he not thought that it was impossible that so beautiful and young a lady would marry a man of fifty. If Mr. Walford lives till he has seen perhaps the double of the years of which he can now boast, he will not make a man of fifty so diffident. Fifty for a man, we are ready to maintain—and he by that time will maintain too—is not an age which is separated by any great gulf from youth and heroines. A man of fifty, he should remember, is only removed by one year from a man of forty-nine, and a man in the forties is in the very prime of life. Had Mr. Smith been sixty it would have been quite another thing. Mr. Smith then, in despair of getting that for which he had not the courage to ask, leaves his house and sets out once more on his travels, while Helen, that she may differ as widely as possible from her lover, sprains her ankle badly and gets confined to her couch. A winter passes away and Mr. Smith returns to London. There he meets the wicked Colonel, who had suspected his attachment to Helen, and is determined, as he cannot get her for himself, to blast her reputation with her lover. He invites him to his house, where he meets Lord Sauffrenden and Captain Wellwood, both of whom knew Helen. We must here remark that neither Mr. Smith nor two men so honourable as these are described as having been would ever have dined with such a scoundrel as the Colonel. But the necessities of the story, while on the one hand they require that Aytoun should be a monster of iniquity, on the other hand demand that he should be on terms of intimacy with good men. The whole account of the dinner party where he tries to ruin Helen's reputation is as outrageous a piece of writing as we have ever come across. Mr. Smith avows his intention of at once going off and offering his hand to Helen. He is accepted, and everything would have gone off merrily enough—for Helen, by the help of her sprained ankle and her memory of this high-minded single gentleman, had during his absence become not unworthy of him—if the author had not chosen this very time for introducing a fit of apoplexy. Now we are not prepared to deny that it plays a very important part in modern novels. But who ever read that one ever happened to a hero? Fathers, mothers, bachelor uncles, maiden aunts, godmothers as childless as they are rich, all these fall down in fits in every novel we pick up, and no one troubles his head about them. But if we know anything of nature—and we ought by this time to know a good deal, considering how many hundreds of these most natural tales we have read—your hero has nothing to fear, but, on the contrary, has everything to hope, from a fit of apoplexy. Mr. Smith, however, contrary to all the rules of nature and art, the very day after he has been accepted is found dead in his room. The reason is clear. The author had started with the intention of plaguing an old gentleman, who had attained the venerable age of fifty, with a giddy young wife. He had, however, in the course of his story, so greatly improved his heroine that when it came to the point he had not the heart to throw away one so young, so pretty, and now so good, on a man old enough to be her father. Mr. Smith accordingly is killed off without the least remorse, while a dashing young captain, Philip Wellwood, is ready at hand to receive the lady who had been made by her aged lover so amiable and so good. Philip in process of time becomes Lord Wellwood, and thus the youthful reader is as much satisfied as the elderly reader will be disgusted. They do not, however, forget Mr. Smith:—

"Helen," said her lover one evening in the bow window, a few days before their marriage, "you must try to teach me the lesson you have learnt since first I knew you. What has made the difference? For you are different, you know," said he, drawing her towards him; "tell me about it."

* *Mr. Smith: a Part of his Life*. By L. B. Walford. Edinburgh and London: Blackwood & Sons. 1874.

"I knew once," she answered, "a simple, noble, Christian gentleman

"That will do," said Philip, softly. "I know. Mr. Smith."

There is not a little merit in the story. It is a pity, however, that there is so much vulgarity and villany to outbalance it. The villain is a very dull one, and though the vulgar people are often drawn with a good deal of cleverness, we get as heartily weary of them as we should were we to meet them in real life. We have little doubt that if Mr. Walford will make as careful a study of pleasant people as he has of those who are disagreeable, he will succeed in writing a pleasant book.

BUIST'S MANUAL OF BIRD-KEEPING.*

THERE is a story of a curate in an out-of-the-way parish who, not being able to afford a wife, wavered between a dog and a pupil for a companion. Though the latter might pay, the former was more certain to be docile and sociable. The same recommendation might perhaps be urged upon solitary bachelors and maiden ladies on behalf of the canary and its kith and kin; for to a temperament in the highest degree given to sociability it adds a teachableness which would seem to be limited only by the amount of kindness and attention bestowed on it. The old saw of "a bird that can sing and won't sing" proceeds clearly upon a misapprehension of the way to get at the bird-heart, and to unlock the rich stores of its natural music; and the volume before us, written by an amateur bird-fancier whose experience is wholly in favour of care, kindness, and liberality in the keeping and rearing of domesticated song-birds, ought to have the effect of reducing the mortality in cages, and of multiplying the flood of unforced song in the sunny windows of town and country houses.

The common method of birdkeeping is the "happy-go-lucky" method, which lets the delicately organized, sensitive, natty, and dandy little creature struggle as best it may with the filth, disease, starvation, and neglect which are its natural antipathies; whereas the secret of success in this art is "to make your tiny *protégé's* simple existence such a boundless delight that it appears to have learnt the secret of perpetual motion as well as that of endless song." And although in these pages a sufficient number of anecdotes are told to prove that bird nature can be wayward, and the personal characteristics of feathered bipeds quite as diverse as those of the "animal bipes implume," yet it is also established beyond a doubt that there is no limit to the affection, attachment, and docility of the caged songbird whose health and happiness are properly looked after. First and foremost the author insists on cleanliness, to secure which and he is in favour of roomy square cages, to be thoroughly washed and cleansed—bars, tray, roof, perches—at least twice a week, and, if it may be, every other day; fresh sand to be given each time, and clean perches, water fountains, and full measure of seed every morning. To these directions add frequent opportunities of a bath all the year round, taking off the chill in winter, lest a sudden check should on a sudden arrest a circulation so fitful and delicate that the mere reversal of the bird's position, if you remove it in a hurry from its cage, will fatally affect the action of the heart. Caution should be observed, too, to make everything dry and snug when the bath is over, as cold, no less than fright or neglect, is a frequent cause of bird-diseases. It will have been seen by this time that the mere schoolboy whim of owning a pet, without dedicating yourself to its daily and hourly tendance, is, certain, sooner or later, to terminate in birdie's being laid out stiff, stark, and lustreless in the domicile over which so many parleys took place with the ironmonger. *Apròpos* of the cage, by the way, we are advised unhesitatingly to have nothing to say to any except the German metallic enamelled cage, the superiority of which to such as are of English manufacture consists in the fact of the colour being exposed to the chemical action of heat, not hand-painted, but enamelled into the metal, so that the paint in which arsenic is often the colouring matter employed is not liable to be pecked off and eaten by the bird inside the cage. In such a cage it is equally impossible that death should approach the bird in the shape of verdigris, innocently mistaken for green food, as not unfrequently happens when the cage is a handsome brass-wired construction, imitative of a Swiss cottage or a Chinese pagoda. Cogent arguments are adduced for preferring to such fantastic shapes the square and unornamental cage, as more conducive to health and happiness as well as to the display of the inmates; and in the carefully written appendix, which is furnished with illustrative diagrams, it is shown how such a cage may be so built as to admit of being taken to pieces and reversed or rearranged according to circumstances, at the cost of five guineas. If the ironmonger declines the order, says our author, you can do it yourself by following his simple directions.

It might be thought that little need be said as to the best situation of a birdcage, as every one must have seen how a bird's voice and plumage are improved by sufficient sunlight. Indeed the best situation for the ordinary cage as well as for the breeding-cage is, in summer, high up in a sunny window, with sufficient air, but out of the reach of cats and of draughts. There is, however, such a thing as too much sun, as when a bird cage is hung against a "red-hot brick wall"; and, on the other hand, in winter the window is the worst of all places for "Dicky," who thrives best

then against an inner wall, in a room warmed by a bright fire and by human companionship. It seems to be a clear rule that extremes of heat or cold are the bird's bane, and an equable temperature its safeguard. In the important matter of food our author strictly forbids all those messes of cake, biscuits, and bread and butter wherewith an ill-judged fondness is apt to ruin the domesticated bird's digestion. Seeds, in liberal allowance and in handy vessels, square or circular, but not less than two inches deep and an inch and a half across, and fresh green food, should be the staple of the bird's diet. The bird's rule of what to eat and what to avoid is regulated by an eye to digestion and due action of the functions of the stomach, so that whilst canary, rape, hemp, and suchlike seeds, and plantain, chickweed, groundsel (in this order) are most wholesome, the acidity of stone-fruits, the rind of apples and pears, and the occurrence of decayed matter in water-cress, cabbage, and lettuce leaves (which the birds like if young and fresh) are apt to bring about death through dyspepsia and diarrhoea. Coarse red sand is said to be the best digestive, and bay-salt, which fanciers recommend as curative of high feeding, has in our author's experience proved anything but successful. Except as a *bonne bouche*, and an occasional luxury, sugar is not to be recommended, certainly not as a make-up for neglect of regular and wholesome food. And least of all is raw meat to be commended, its tendency being to make a bird savage and quarrelsome:—

I once [writes the bird-fancier] gave a canary to a poor woman, excessively fond of animals. In a short time it was brought back with a request to be told what could be the matter with him, "as the bird had always received plenty to eat." I inquired as to the items comprising this plenty, and was informed, "Oh, everything wot I eats myself; yesterday he had carrots and turnip-tops" (uncooked!); "to-day a shred of beefsteak, and bread and butter to his tea; and he ate it beautiful, he did." Cooked chop, minced veal, raw beef, all and sundry found their way to the canary's gizzard, greatly to his temporal debilitation, and—ultimate destruction! In short, the bird became a prey to red mites, sores, bad health, and worse temper.

The criteria of health—a general brightness of plumage, eyes, beak, and legs—are fully discussed in a long and interesting chapter, which withal suggests specifics for the diseases to which canary flesh is heir. A rusty nail is a famous tonic, if dropped into the drinking fountain, and camphor supplies an excellent cordial. Castor-oil on a spoonful of linseed, or dropped on the inflamed part, is good for inflammation, and change of air, scene, and cage effect as wonderful recoveries in the bird world as in the case of human invalids. But the author clearly thinks that prevention is better than cure, and quite as easily brought into play by the limited number of persons who approach birdkeeping with proper ideas of its responsibilities. In the list of these regard to cleanliness, good food, fresh air, and plenty of sunlight comes first and foremost. Where these are considered, there need be no "red mites," a plague which has taxed the invention of all the professional bird-fanciers to cure, and which, once present, requires to be literally stamped out. The "red mite" is a tiny parasite, something like the small spider called a money-spinner, and it is engendered by a dirty cage, stale food, impure water, and a lack of sufficient coarse sand. Once generated, they soon "eat up" a bird, and as they hide all day, it requires stratagem to detect their presence. A white cloth thrown over the cage at night will, on a sudden shining of a light in the darkness, reveal a number of flying dots. Impregnate this cloth with camphor, and place the cage in a flat vessel of water, and the mites will prefer drowning to the smell of the camphor. A solution of quassia chips is a more ticklish experiment, and so is the vermin-powder which some fanciers recommend. A cage once infested should at once be destroyed, or, as the next best thing, plunged in strongly camphorized water. But, as has been already said, the evil should not have been allowed to get a footing. As to health and disease in cage-birds, the author does not note what we learn elsewhere from Dr. Brehm, that some perfumes are so injurious to canaries that the presence of an *Orchis bifolia* in a room occupied by three of them for a single night resulted in the death of two, the females, before morning.

The account of the mysteries of profitable breeding is very curious, in that it involves the rule of contraries in the selection of parents, e.g. two rich-coloured canaries produce light-hued offspring; mealy parents have white young; and, when the parents are both crested, the chicks will be all bald. The belief that if a bird loses its mate it will not pair again that year is more romantic than true. A substitute, in our author's experience, is frequently accepted in a very few days. Essentials to success in breeding are good ventilation, sunlight, quiet, and privacy, and it is best not to pair more than a couple at a time in one place. Following the advice of the volume before us, there is no reason why an amateur should not attain much the same assurance of successful breeding as the Germans in the region of the Hartz mountains, who are as famous for the healthy broods as for the splendid voices of their canaries. From them probably has been borrowed the hint, affirmed by experience, that a large number of pairs of birds in the same room answers better in breeding than a couple of pairs. In the latter case rivalry and jealousy create disturbance and disappointment. In the former there is safety in numbers. Even in a single pair there is often a divided will. We read in p. 78 of a canary Penelope which unravelled every night the nest that her provident mate took such pains in building up by day; and what made this the more curious was that this hen was not the less a devoted mother. From the chapter on personal characteristics we should gather that cage birds are curiously freakish and fanciful. One cock, for instance, is a confirmed hermit, happy in his own society, but churlish in that of his kind, and especially

* *Birds: their Cages and their Keep.* A Practical Manual of Bird-keeping and Bird-rearing. By K. A. Buist. London: Macmillan & Co. 1874.

averse to the fascinations of the canary belle, Crestie, although she is described as "an angel of canary charms and graces." But this bird must have had his "mollia tempora fandi," for we read in p. 83 of a son of his whose character was just the reverse, and whose liveliness was quite irrepressible. A pretty history is given of another canary which the author brought up by hand from a week old, which became an inseparable ally to its mistress, was fond of prancing on the piano keys, knew when it had done wrong, and possessed an instinct very little different from reflection and thought. But this bird lacked the bump of locality, and because unable to distinguish the back of the house from the front, wandered away from home into the woods, where, as he was only half a canary, he may still be living happily amidst his linnet cousins.

In the course of this pleasant volume the amateur may get some capital hints on the purchase of canaries (Belgian, Green, Lizard, Cinnamon, or London Fancy), and on the choice of foreign birds—among which the most prepossessing are the Waxbill and Spice birds. It appears that the canaries take kindly enough to these interlopers. But by far the most interesting topic, on which we have not yet touched, is that which relates to the training and teaching. Many readers have seen performing canaries at Welsh and English watering-places which can pull a trigger, dance on a tight-rope, and emulate Blondin in the wheelbarrow trick. These antic birds can also be taught almost every phase of imitative harmony. Are we then to believe the protestations of their itinerant showmen, that they have been trained simply by the rule of love? The author implies a contrary belief in the picture drawn of eyes scorched by red-hot needles to make Dick a songster by night as well as day; of hearing stunned as the price of skill in pistol-firing; and of Blondins and danseuses educated in cages fitted with red-hot perches during lesson-time. We would fain hope that, even if there has been resort to such gratuitous cruelty, the fact amply brought out in these pages, that kindness pays far better, and accomplishes more satisfactory results both in the bird concerts and in the bird-market, will have its due weight with professional fanciers and trainers. By gentleness of hand, voice, and step you can teach the pet bird anything, especially if you begin with it young, and have taken pains to select a good voice, wit, capacity, and constitution. And there is something moreover in appealing not only to the principle of imitation, but also to that of "payment for results." Witness Bechstein's two pet birds:—

One was an idle little vagabond allowed to roam out of his cage as often as he felt inclined. The other lived chained to a stool, and was trained to procure its food by a lever pressed with its foot. On a certain day Bechstein forgot to supply seed to the former, and was greatly interested to see the uneducated bird, inspired by hunger, perch on his rival's trough, lift it up with his claw, as he had seen the latter do, and take a hearty breakfast.

Necessity had been here the mother of invention; and no doubt bird wits as well as bird voices are susceptible of far more cultivation by the fair means suggested in the book before us than by the foul means which are simply another expression for fruitless torture.

FRENCH LITERATURE.

THE second volume of M. Jules Simon's work contains the history of the Government which sprang from the catastrophe of September 1870*; it is divided into four books, and is written in a calm and dispassionate style. The author points out with sufficient accuracy the principal faults of the Imperial system, but at the same time he does justice to the good qualities of Napoleon III.; and it will no doubt surprise many readers to see a Republican say of the late Emperor, "cet homme, qui a perdu son pays, aimait son pays." Of course M. Jules Simon believes that the future well-being of France depends on the consolidation of the Republic, and that universal suffrage is the panacea of modern society. It must be remembered, however, that the Communists, Socialists, and Terrorists whom he denounces so severely assert with equal confidence that *they*, and they alone, represent the political régime of the nineteenth century.

M. l'abbé Raboisson's conclusions are diametrically opposed to those of M. Jules Simon. If De Maistre and Viscount de Bonald could easily find arguments for their theories of government in the tragic progress of the early Revolution, the course of French history since 1815 has brought a mass of startling facts in support of writers who are disposed to endorse the views so eloquently maintained in the *Soirées de Saint-Petersbourg* and the *Législation primitive*. M. Raboisson is one of these writers†; struck by the hopeless condition of France, and by the anxiety which he sees prevailing everywhere, he endeavours to ascertain the cause of this melancholy disorganization, and to point out the remedy. Even acknowledged champions of the Revolutionary school, such as Proudhon and Pierre Leroux, have long since expressed their opinion that France is shut up, politically, in a circle from which it must find an issue if it would remain the pioneer of thought and progress; nay more, that it is the blind and senseless fanaticism for Jean-Jacques Rousseau's system which has produced all the evil. Thus armed with objections which he has borrowed from the arsenal of democracy, M. Raboisson recommends a speedy return to the old traditions of France, and advocates with much

talent and unquestionable fervour the cause of a Legitimist Restoration.

After having described in a clear and popular manner the state of public instruction in Germany, England, and the United States of North America, M. Hippeau takes us to Italy.* Circumstances have enabled him to enjoy familiar intercourse with the most eminent statesmen and writers of that country, and to obtain from them the materials of the present volume. The introduction which he has prefixed to his report gives us some interesting details as to the efforts made by the Italians to bring about the political unity of their country, and to create an efficient system of public instruction. As M. Hippeau aptly remarks, we should never forget how difficult it is to shake off the traditions of the past, and there is no doubt that in Italy the problem was peculiarly arduous. The task, however, was undertaken by men who were determined to bring it to a satisfactory issue, and the results obtained have abundantly justified their efforts. M. Hippeau's volume is virtually a blue-book; it embraces every kind of instruction, from the elementary teaching given in what we should call National Schools to University lectures of the highest kind, and the author has likewise enabled us to compare the reformed system now prevailing throughout Italy with the old routine which existed when all these matters were subject to the immediate influence of the Holy See.

It is merely by way of contrast that we pass from M. Hippeau to M. Charles Louandre‡; for assuredly the least strait-laced of teachers would scarcely place on the list of school-books a selection from the French novelists of the eighteenth century. When we remember that Marmontel entitled his tales *Contes moraux*, we may well question the morality, not to say the decency, of works of fiction which did not put forth any pretensions to that epithet. It is impossible, however, to ignore a style of literature essentially French in its character, and which is associated with the names of Montesquieu, Voltaire, Hamilton, and Caylus; a gallery of portraits opening with Guillaume de Lorris could not be deemed complete if it did not include Diderot, and the students of literature who have looked into Pantagruel are quite prepared to enjoy the *lutrin vivant*. M. Louandre's preface gives a very good view of the literature of fiction a hundred years ago. In those days of ardent polemics and of revolutionary fervour, every kind of writing was turned into a weapon against the old order of things, and even the doctrines of the economists formed the subject of a novel. It has long been the fashion to laugh at the so-called historical romances of La Calprenède and Mlle. de Scudéry; but we have no hesitation in saying that they deserved the appellation much more than Marmontel's *Bélisaire* and Florian's *Gonzalve de Cordoue*. M. Louandre will be found an excellent guide to this farrago of declamatory rubbish, and his critiques may be recommended to the courageous and venturesome reader who, having plenty of spare time, wishes to see for himself how historical characters can be made to speak like the *habitués* of the Café Procope or the friends of Mme. du Deffand. As to what may be designated as the novels of real life, we should strongly advise our readers to be satisfied with the extracts given by M. Louandre; they will find enough to convince them that further investigation would scarcely be expedient.

M. Boucher's monograph on Cowper is, we believe, the expansion of an essay written for the doctor's degree.† M. Mézières and M. Sainte-Beuve had already shown that there are Frenchmen capable of enjoying the quiet beauties of the author of "The Task"; but their notices of Cowper do not pretend to be anything more than brief literary *complex-readus*, whilst M. Boucher gives us the biography of the poet, and an account not only of his poetry, but of his correspondence. He appreciates with much accuracy the genius of a writer whose great merit is to have delivered art from the fetters which the rhymesters of the school of Pope had cast around it. Cowper, studied by himself and independently of any comparison, will strike the unprejudiced reader as an admirable poet; how much more if we open his works after reading Hayley, or even Beattie! Nor must we leave unmentioned those choice specimens of epistolary chit-chat which, whilst they throw so much light upon his character, have secured for him a distinguished place on the roll of English prose-writers. M. Sainte-Beuve had already introduced Cowper to the notice of readers on the other side of the Channel, and M. Boucher's excellent little volume cannot fail to increase his popularity in France.

M. Paul Albert's lectures§ on the eighteenth century are a creditable summary, but nothing more, and we have so often heard or read eulogies of Voltaire, Rousseau, Diderot, and the Encyclopédistes, that the subject is worn threadbare. Saint-Pierre obtains in this volume more attention than is generally bestowed upon him, and his *polysynodie* is carefully analysed. The conclusion which most people will draw from M. Albert's volume, as well as from others on the same topic, is that, although reforms were unquestionably necessary in 1789, the men who advocated them were seldom those whose moral character best qualified them for the office. Our author talks a good deal about Voltaire's *sensibilité* and his efforts on behalf of toleration; but he does not add that

* *L'instruction publique en Italie*. Par C. Hippeau. Paris: Didot.

† *Chefs-d'œuvre des conteurs français. XVIIIe siècle*. Par Charles Louandre. Paris: Charpentier.

‡ *William Cowper, sa correspondance et ses poésies*. Paris: Sandos et Fischbacher.

§ *La littérature française au 18e siècle*. Par M. Paul Albert. Paris and London: L. Hachette & Co.

* *Souvenirs du 4 Septembre: le gouvernement de la défense nationale*. Par J. Simon. Paris: Lévy.

† *Le pouvoir: ses origines, etc.* Par M. l'abbé Raboisson. Paris: Plon.

the adversary of Fréron, Le Franc de Pompignan, and Guettée, was himself the most intolerant and spiteful of mortals, and that he never hesitated to tell downright lies if he could advance his purpose by doing so. It is very well to say that the *Année littéraire* is a tedious compilation, and perhaps no one will take the trouble to verify M. Albert's criticism; but those who feel inclined to do so cannot fail to observe that Fréron as a journalist was infinitely superior to the author of the *Dictionnaire philosophique*.

The history of religious ideas in Germany from Lessing to Strauss is so extensive a theme that in the space of three octavo volumes it is hardly possible to give more than a simple sketch of it. As a sketch, however, M. Lichtenberger's work * deserves to be studied, and it will be found an excellent guide for students who wish to have the principal landmarks pointed out to them before they proceed further. M. Lichtenberger divides his subject into three distinct periods, respectively identified with the names of Lessing, Schleiermacher, and Strauss; he borrows from biographies, letters, and memoirs, details which enliven the dry statements of theological and metaphysical subtleties, while they help at the same time to explain them. He writes as a champion of orthodox doctrines, but nevertheless with creditable impartiality and moderation.

Philosophy and religion form likewise the subject of M. Klopp's new and interesting volume.† It is well known that the publication of the complete works of Leibnitz has for some time past been going on; the extensive correspondence carried on by the philosopher is not the least important feature in this undertaking, and it is well calculated to excite the curiosity even of readers who do not care much about philosophy. We think, therefore, that M. Klopp has judged wisely in printing in a separate form the letters of Leibnitz, and we are glad to welcome this first instalment of a collection which is to comprise three handsome volumes. A large part of it is already known, for it consists of the series of letters addressed to Bossuet on the possibility of a reconciliation between the Catholic and the Protestant Churches. In addition to these documents, M. Klopp has been able to discover a second set of despatches referring to the political conduct of the Electress Sophia of Brunswick-Lünebourg, and to her rights as presumptive heiress of the Crowns of Great Britain and Ireland. Thus it will be seen that the work has special interest for English readers. M. Klopp has prefixed to it an introduction explaining the character of the Princess, and showing the necessity of arranging all the letters according to a strictly chronological order. A portrait of the Electress is added, and a copious alphabetical index terminates the book.

The five articles collected by M. Jules Soury in his new volume‡ have nothing in particular to recommend them, and might have passed away altogether unnoticed but for the high-sounding and ambitious preface which accompanies them. We can scarcely imagine a grander flourish of trumpets to announce a treatise on the history of civilization in general than the one which introduces to our acquaintance the Delia of Tibullus, Mme. de Pompadour, Mme. Récamier, and the daughters of Louis XV. M. Soury, who professes himself a disciple of Messrs. Herbert Spencer, Taine, Wundt, and Hartmann, considers that in course of time the world will appear to all unprejudiced persons as a vast system of forces, and that intellectual phenomena will be regarded as the results of the laws of mechanics. Mme. de Pompadour and Mme. de Caylus are, we grant, capital illustrations of a system which ends in the grossest materialism; but Mme. Récamier might perhaps claim the benefit of an exception. M. Soury complains somewhere that vulgarity is speedily becoming the law of society; and by way of consolation he directs us to the Buddha Çakamuni, and invites us to embrace the doctrine of annihilation. The only solace we can find in this view is that it will make short work of M. Soury's so-called *études de psychologie*.

M. Edouard de Barthélemy has made excellent use of the numerous documents he has been enabled to consult, including the manuscript papers of the Marchioness de Balleroy, the archives of the Court of Modena, and the rich collections so jealously preserved at the French Foreign Office. Assisted by these sources of information, and having also within his reach the endless memoirs and autobiographies composed during the last century, he has written a couple of excellent volumes on the daughters of the Regent Duke of Orleans.§ Amongst these ladies one alone had hitherto received some degree of attention from persons who are fond of historical curiosities; it was the notorious Duchess of Berry, and we do not think we are calumniating any one when we say that the scandal of Louise-Elizabeth-Marie d'Orléans's life was the chief cause of the posthumous celebrity she obtained. M. Arsène Houssaye is among the chief offenders in this matter; according to him vice is hardly vice when it is seasoned with wit and concealed under a chaplet of flowers. M. de Barthélemy does not think so, and the chapter he has dedicated to the life of the Duchess of Berry is not calculated to create a spurious interest in her behalf. The other sisters, Mlle. de Valois, the Abbess of Chelles, the Queen of Spain, Mlle. de Beaujolais, and the Princess de Conti, are successively made to sit for their likenesses; and on the first-named of these four ladies especially

M. de Barthélemy has been able to collect much interesting information. Very few persons have been more exposed to the attacks of pamphlet-writers, satirists, and journalists than the Regent's daughters; and if too often the attacks of contemporary critics find their justification in well-ascertained facts, calumny, on the other hand, has also been busily at work. M. de Barthélemy is quite aware of this, and his work contains the refutation of many rumours which should now be for ever exploded.

The third volume of the Empress Maria Theresia's secret correspondence with Count de Mercy-Argenteau * completes, at least for the present, a work which reflects the highest credit upon M. Geoffroy and Herr von Arneth. The documents here collected are of equal interest with those previously published, and we have now the satisfaction of knowing the true Marie Antoinette, whereas the apocryphal letters issued some years ago by M. Feuillet de Couches were like so many chapters in a sensational romance. Amongst the numerous political personages of importance who figure in this new volume is the Emperor Joseph II. It is well known that he visited France in 1777, and that he arrived at Paris full of prejudices against the nation over whom his unfortunate sister was called upon to reign. Count de Mercy-Argenteau takes care to keep the Empress informed of every particular in this journey, and he gives a kind of diary of the residence of Joseph II. at Versailles and Trianon. It is interesting to observe how the Emperor's prejudices against the French people gradually subsided; we are glad also to remark the excellent advice he offers to his sister—advice of which she stood much in need amongst the dangers by which she was surrounded from the influence of the Counts of Artois and of Provence, and a coterie of the most unprincipled courtiers and favourites of both sexes. This third volume is quite worthy of the two preceding ones; a minute index to the whole work terminates it.

M. Natalis de Wailly has just brought out a new edition of his Villehardouin.† This magnificent octavo forms part of a collection which is to include choice specimens of the French mediæval authors, illustrated with all the resources supplied by erudition, pictorial art, and typography. The principal features of this edition are the *éclaircissements*, or essays intended to elucidate the various questions of archæology, history, geography, and grammar connected with the *Chronique de Constantinople*. One of the most important preliminary problems is the amount of authority belonging to Villehardouin himself. M. de Mas Latrie in his *Histoire de l'île de Chypre* having attempted to represent the chronicler as utterly untrustworthy, it behoved M. de Wailly to refute this extraordinary assertion, and we think that he has done so in a manner which leaves no room for objection. The disquisitions on the value of the coinage mentioned by Villehardouin and on the armour used by the Crusaders are welcome contributions to the science of mediæval antiquities, and the grammar with the accompanying lexicon will be found of great service to readers who wish to study the original text. M. Firmin Didot's splendid library of illuminated MSS. has furnished the artist with designs in the shape of vignettes, headings, initial letters, and tail-pieces belonging to the thirteenth century. We must also mention the map and the geographical essay for which we are indebted to M. Longnon; this was not the least difficult part of the elucidatory matter, considering the way in which proper names are misspelled by the old historian.

It was certainly high time that a Society should be formed for the improvement of the French stage, and M. Paul Féval's *causerie* ‡, delivered at the opening meeting, is full of sound advice, though we doubt very much whether the end aimed at can be realized. The reform must begin much higher than the dramatic world, and so long as a public eaten up by materialism encourages the production of such offensive pieces as *Le Sphinx* and *Thérèse Raquin*, there will be little chance for *Le Théâtre moral*. The fact that even the cherished abode of classical taste, the hearth and home of Corneille, Molière, and Racine, is now invaded by what M. Féval aptly calls vitriolic literature, is a formidable symptom. It may seem amusing to many readers to find *La fille de madame Angot* quoted as an improvement on the usual style of modern dramatic compositions; but so it is, and, if compared with *La grande duchesse*, the work certainly deserves one of the Monthyon prizes. The degeneracy must be great indeed when we see *Le demi-monde* performed at the Théâtre Français. The question is, where is the writer whose genius shall counter-balance the popularity of MM. Ludovic Halévy and Co.? Not M. Camille Doucet, we are sorry to say; this gentleman's comedies, recently collected in a couple of volumes,§ are well written, and are certainly blameless so far as morality is concerned; but they lack the originality and power which draw crowds and fill the cashbox of a manager. If performed now, they would not obtain more than a *succès d'estime*; and since his admission at the Académie Française, the successor of M. Alfred de Vigny seems to have deserted the cause of literature.

Among contemporary writers of fiction M. Fertiault, with his

* *Marie Antoinette : correspondance secrète entre Marie Thérèse et le comte de Mercy-Argenteau*. Publié par M. le chevalier d'Arneth et M. Geoffroy. Vol. 3. Paris : Didot.

† *Geoffroy de Villehardouin, conquête de Constantinople*, etc. Texte original, accompagné d'une traduction, par M. Natalis de Wailly. Paris : Didot.

‡ *Le Théâtre moral. Causerie*. Par M. Paul Féval. Paris : Dentu.

§ *Œuvres complètes de Camille Doucet, de l'Académie française*. Paris : Lévy.

* *Histoire des idées religieuses en Allemagne, depuis le milieu du 18^e siècle jusqu'à nos jours*. Par F. Lichtenberger. Paris : Sandoz et Fischbacher.

† *Correspondance de Leibnitz avec l'électrice Sophie de Brunswick-Lünebourg*. Publié par O. Klopp. Tome 1^{er}. Hanover : Klindworth.

‡ *Portraits de femmes*. Par Jules Soury. Paris : Sandoz et Fischbacher.

§ *Les filles du Régent*. Par Edouard de Barthélemy. Paris : Didot.

*Chambre aux histoires**, deserves honourable mention. The room where these ten delightful stories are related is that of Mme. des Estranges, and the occasion of them is a spell of rainy weather which compels Madame's guests to cluster round the fireside instead of enjoying the pleasures of out-of-door life on the Count's estates. But well-bred and intelligent people are never at a loss for amusement; the visitors contribute one story each for the edification of the rest, and the result is a book which we can heartily recommend to our readers.

M. Alphonse Karr's new volume† would not attract much notice if it did not bear the name of the author of *Sous les tilleuls*, *Po-dieu*, *Une heure trop tard*, and so many other brilliant productions of combined pathos and humour. It consists of a number of fragments which have already appeared in sundry periodicals, grouped together under an unintelligible title.

Novels, which aspire to the dignity of being called historical have considerably degenerated in France since the days of M. Alexander Dumas père, and, with the exception of M. Paul Féval, we do not know whom we could mention as worthily representing that style of literature. M. Assollant, however, deserves a word to be said of his new tale *Le seigneur de Lanterne*‡; it is an interesting, well-written, and thoroughly readable account of the daring deeds perpetrated by the smugglers who two hundred years ago waged war against the collectors of the hated salt-tax.

Le mot de l'énigme§, like most of Mrs. Craven's works, originally appeared in the *Correspondant*; it exhibits all the good qualities and also all the faults which characterize her as a writer. It strikes us that the incident which forms the key to the plot is of very doubtful morality.

M. de Chambrier has|| published an interesting account of his journey to Greece and to Treas; he speaks of the fine arts as a true artist, of antiquity with the experience of a man who has studied the historians of classical times, and his description of Switzerland shows that he has a keen appreciation of the beauties of nature.

* *La Chambre aux histoires*. Par P. Fortiault. Paris: Didier.

† *La promenade des Anglais*. Par Alphonse Karr. Paris: Lévy.

‡ *Le seigneur de Lanterne*. Par Alfred Assollant. Paris: Dentu.

§ *Le mot de l'énigme*. Par Mme. Craven. Paris: Didier.

|| *Un peu partout, du Rhodope aux Alpes*. Par J. de Chambrier. Paris: Didier.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

THE UNITED STATES.

The Annual Subscription to the SATURDAY REVIEW, including postage to any part of the United States, is £1 10s. 6d., or \$7 60 gold, and may be forwarded direct to the Publisher, at the Office, 38 Southampton Street, Strand, or to Mr. B. F. STEVENS, American Agency, 17 Henrietta Street, Covent Garden, London. International Money Orders can be sent from any office in the United States, and Subscriptions, payable in advance, may commence at any time.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

DORÉ'S GREAT PICTURE OF "CHRIST LEAVING THE PRÆTORIUM," with "The Dream of Pilate's Wife," "Night of the Crucifixion," "Christ's Martyr," "Francisco de Rimini," "Andromeda," &c., at the DORÉ GALLERY, 25 New Bond Street. Ten to Six—Admission, 1s.

THE ARUNDEL SOCIETY'S FACSIMILES in COLOUR from the OLD MASTERS are Exhibited Free to the Public, Daily, and Sold from 40s. to 10s. each. Descriptive Lists sent, post free, on application to 24 Old Bond Street, London, W.

MALVERN COLLEGE.

This College contains two Departments—the CLASSICAL and the MODERN. There is also a preparatory LOWER SCHOOL.

There are Boarding-Houses within the College Grounds, held by the Head-Master and others of his Staff, a Gymnasium, &c.

Board and Tuition under fourteen, £50; over fourteen, £60. Non-Scholar holders pay an extra fee of £6. Special advantages for Sons of Clergymen and Home Boarders.

For further information apply to the Rev. ARTHUR FAULN, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

The Examination for Scholarships and Exhibitions on December 22 and 23.

MALVERN COLLEGE.

THE ANNUAL EXAMINATION for SCHOLARSHIPS and EXHIBITIONS will be held on December 22 and 23. There will be awarded Six House Scholarships of £80, Four Founders' Scholarships of £50, and some Exhibitions of £30. The Awards will be for one, or for two years, according to merit, in Classics or Mathematics. For particulars apply to the HEAD-MASTER.

ABINGDON SCHOOL (Six miles from Oxford).—An Old Foundation, with University Scholarships, having new Buildings and extensive Grounds. There are Classical and Modern sides, and a Public School training is given on moderate terms. For particulars, and admission in January, apply to Rev. E. SYMONDS, Head-Master.

S. PETER'S SCHOOL, YORK.—Two Foundation SCHOLARSHIPS and Two Free Scholarships are awarded annually at the Midsummer Examination. Foundation Scholarships entitle the Scholars to Free Board (in the Head-Master's house) and Free Education. Free Scholarships to Free Education only. For full particulars apply to the Rev. the HEAD-MASTER.

TO HEAD-MASTERS of PUBLIC SCHOOLS.—A

CLERGYMAN, late Fellow of his College, who has had long experience, and considerable success in the preparation of Pupils for the various Competitive Examinations, would be glad to undertake the MANAGEMENT of the SPECIAL DEPARTMENT in a Public School. This chief motive in seeking such a post is to enable candidates to complete their preparation without leaving the wholesome influence of Public School training, and without the risk and danger which attend their removal to Private Establishments. Address, M.A., care of Mr. R. C. Clifford Poulter, 12 Middle Temple Lane, E.C.

MILITARY PUPILS.—A GENTLEMAN with a first-rate Establishment whose Pupils are intended for the various Public Examinations, wishes to CAPT with his CONSENT for a fair CONSULTRATION. The net Annual Income is between £1,000 and £1,500. Address, M.A., 50 Brickwork Road, Tufnell Park, N.

EDUCATION in PARIS.—A MARRIED LADY, who, with her Husband (a German by birth) resides in a charming and airy part of Paris, is desirous of meeting with THREE or FOUR LITTLE GIRLS or TWO YOUNG LADIES, to whom she offers great Educational advantages, together with all the comforts and refinements of a well-appointed Home. The highest English references can be given. Address, D.L., Stevens's Library, 11 Duke Street, Grosvenor Square.

AGRICULTURAL PUPIL.—A GENTLEMAN residing in a beautiful part of Hampshire, and having the management of landed Estates, has a VACANCY for a PUPIL. A knowledge of Agriculture in all its branches, and over a wide description of Soil, can be obtained, including the Breeding and Feeding of Stock and growth of Hops. This will be found an excellent opportunity for completing agricultural study. Terms (which will include the use of a horse, and full particulars) can be obtained on application to FREDERICK GRIPS, Esq., Barrister-at-Law, 7 New Square, Lincoln's Inn, London, W.C.

A GOVERNESS PUPIL is WANTED in a First-class German School. Address, W. 63119, care of Messrs. Hauserstein & Vogler, Frankfurt-on-the-Main.

MALVERN.—HYDROPATHY.—Dr. RAYNER'S ESTABLISHMENT (formerly Drs. Wilson and Rayner). For prospectus apply to T. RAYNER, M.D., Malvern.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. Physician, Dr. EDWARD LANE, M.A., M.D., Edin. For Invalids and those requiring rest and change. Turkish Baths on the premises.

OVERLAND ROUTE and SUEZ CANAL.—Under Contract for the conveyance of the Mail to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, via the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday. Offices, 122 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel. ROBERT PARK, Manager.

AGREEABLE WINTER RESIDENCE.—ILFRACOMBE HOTEL.—High and Equable Temperature. Moderate Charges "en Pension." Through Trains direct from Waterloo.

WINTER at the GRANVILLE.—Replete with Home comfort. Hydropaths, Turkish, Ozene, Balneo, Plunge, and Medical Baths. Billiard and Concert Rooms; American Bowling Alley; beautiful Views, Sea and Shipping. Table-d'hôte 6.30 P.M.—Address, THE MANAGER, St. Lawrence-on-Sea, Margate.

BEDSTEADS, BEDDING, and FURNITURE.—BEDSTEADS, IRON and BRASS, and CHILDREN'S COTS. A very large assortment of 150 patterns on Show, from 11s. 6d. to £35.

BEDDING Manufactured on the Premises, and Warranted by WILLIAM S. BURTON.

For Bedsteads.	Width: 3 ft.	4 ft. 6 in.	6 ft.
Best French Alta Mattresses	13s. 6d.	18s. 6d.	20s. 6d.
Coloured Wool ditto	17s. 6d.	20s. 6d.	22s. 6d.
Best Brown Wool ditto	20s. 6d.	23s. 6d.	27s. 6d.
Good White Wool ditto	21s. 6d.	24s. 6d.	28s. 6d.
Extra Super ditto	26s. 6d.	27s. 6d.	31s. 6d.
Superior Horse Hair ditto	42s. 6d.	53s. 6d.	60s. 6d.
Extra Super ditto	61s. 6d.	72s. 6d.	104s. 6d.
German Spring	30s. 6d.	34s. 6d.	74s. 6d.
Superior ditto, Hair Stuffing	62s. 6d.	67s. 6d.	95s. 6d.
Feather Beds, from 81s. to 100s.; Bolsters, 9s. to 22s. 6d.; 60. Pillows, 2s. 6d. to 13s.; Down Pillows, 11s. 6d. to 12s.			

FURNITURE for BED-ROOMS and DINING-ROOMS.—Complete Suites in Mahogany, Fancy Woods, Polished and Japaned Deal, always on Show.

FURNITURE FOR DINING-ROOMS.—An Assortment of Sideboards, Dining Tables, Dinner Waggons, Chairs, Couches, and every other article of Dining-room Furniture in the most elegant and durable style. Early Chairs, a large selection in the Hotel. Chimney and Pier Glasses, a large and new Assortment, from 7s. 6d. On delivery post free.

WILLIAM S. BURTON, General Furnishing Ironmonger, by appointment to H.R.H. the Prince of Wales, sends a CATALOGUE, containing upwards of 400 Illustrations of his unrivalled Stock, with Lists of Prices and Plans of the 30 large Show-rooms, postage free. 38 Oxford Street, W.; 1, 3, 5, and 6 Newman Street; 4, 5, and 6 Perry's Place; and 1 Newman Yard, London, W. The Cost of delivering Goods to the most distant parts of the United Kingdom by Railway is trifling. WILLIAM S. BURTON will always undertake delivery at a small fixed rate.

PICTURES, BRONZES, and WORKS of ART on SALE at 38 Southampton Street, Strand. Pictures Cleaned, Lined, and Restored, if in the worst condition. Frames Cleaned or Regilt equal to New. Sales attended on Commission. CHARLES DEAR, 38 Southampton Street, Strand.

MR. GLADSTONE'S PAMPHLET.

THE only remarkable point in Mr. GLADSTONE's last pamphlet is that it should have been written by the most eminent member of the English Parliament, the leader of a great party, and one of the most powerful Ministers of recent times. The literary merit of the publication is small, and it is totally devoid of novelty. Some of the propositions which it contains are undeniably true, but Mr. GLADSTONE, after proving the substance of his case, not unreasonably raises two further issues. "Being true, are the propositions material? Being true and material, were the propositions proper to be set forth by the present writer?" The answer is that, for any practical purpose, the propositions are not material; and that the writer might have been better employed in pursuing his lucubrations on HOMER. Every educated person who feels even a superficial interest in the events of current history was already well aware that in the Syllabus and in the Vatican Decrees the POPE had exhausted the resources of ecclesiastical Latin in rhetorical exaggerations of the most offensive paradoxes by which sacerdotal arrogance could challenge human reason. The extracts from those documents which are collected by Mr. GLADSTONE might startle a novice who had never heard of the Church of Rome, or become acquainted with its language, but the ordinary Englishman, after glancing over pages of inflated falsehood, reflects with some complacency that the Syllabus is no concern of his, and passes on with a smile and a shrug to his own business or amusement. If the publication of the present POPE's bombastic claims furnishes no reason for a change in the course of English policy and legislation, it may be confidently asserted that Mr. GLADSTONE's propositions "were not proper to be set forth by the present writer." As might be expected, Mr. GLADSTONE disclaims, doubtless with perfect sincerity, any intention of allowing religious differences to affect his conduct in dealing with civil rights; but if his own course of action and that of those who may follow his guidance is not to be influenced by the pretensions of the Church of Rome, it is at least imprudent on the part of a distinguished statesman to enunciate doctrines which are not designed to lead to any practical conclusion. It is difficult to believe that in the maturity of his experience Mr. GLADSTONE can seriously hope that the Roman Catholics will as a body respond to his invitation by protesting against the decisions of the Vatican Council. It is true that the most learned and one of the ablest of the English Roman Catholic laity has, in a comment on Mr. GLADSTONE's erroneous assumptions, taken occasion to recapitulate with humorous minuteness some of the more atrocious acts and opinions of infallible Popes; but, as Mr. GLADSTONE is well aware, Lord ACTON knows too much and thinks too independently to enjoy the favour of the Vatican or the confidence of the Romish hierarchy in England.

Although Mr. GLADSTONE may quote the authority of Prince BISMARCK for his indignant resistance to the claims of Rome, the German statesman, if less judicious, is more consistent than his English ally. If the dogma of infallibility is dangerous to the civil power, it follows that there may perhaps be some justification for interference with episcopal and clerical functions, and even for the imprisonment of contumacious bishops. Mr. GLADSTONE will never propose laws for locking up Archbishop MANNING or Cardinal Cullen; and it is undignified to rail against their faith when he can do them no harm. There has, in fact, since the rival follies of the Papal Aggression and the Ecclesias-

tical Titles Bill been no panic equally groundless with the shock which was produced in some minds by the dogma of infallibility. Roman Catholics already believed many things which were incredible to Protestants; and their relation to the heterodox world was in no way altered by their believing one impossibility more. As Lord ACTON reminds his readers, a Pope who hired an assassin to murder Queen ELIZABETH has since been elevated to the dignity of a saint. It was impossible for the Roman Church to affirm more solemnly the proposition that, if he was not infallible in devising a murder, he was at least perfectly in the right. To those who are outside the pale of his communion the POPE is neither more nor less infallible than before; and any interference with his votaries violates the inalienable right of freemen to talk nonsense and to pretend to believe it.

Mr. GLADSTONE goes out of his way to denounce an innovation in the style of the Council. It seems that the Council of Trent announced its conclusions as resulting from its own authority, and that at the Vatican the POPE made the decrees in his own name, "with the approval of the Sacred Council." It is difficult to understand why Mr. GLADSTONE should trouble himself with the supposed usurpations of the POPE on the authority of the bishops. It may be that, as he says, "Rome has substituted for the proud boast of *semper eadem* a policy of violence and change of faith"; but those who differed from Rome when it was identical with itself have no right to complain of any variation. In the same spirit a zealous Anglican prelate frequently assures the Wesleyans that they have departed from the doctrines of their founder. The representatives of the sect reply in substance that they are satisfied with their own consistency, and that it is not for strangers to meddle with their opinions. A few years ago some whist-players began to indicate to their partners, by playing cards in an unusual order, that they wished a certain course to be adopted in return. Old-fashioned purists for a time protested against the innovation; but ultimately the best players and the most authoritative writers on the art sanctioned the practice, which is now universally adopted, of "calling for trumps." Whist is no longer *semper eadem*; but it is not known that bystanders who never took part in a rubber attempted to protest against the decision of experts. Mr. GLADSTONE further complains that Rome "has refurbished and paraded anew every rusty tool she was fondly thought to have disused." It is still more unreasonable to lament over the restoration of obsolete absurdities than to denounce innovation. Every legislator is bound to take notice that the rusty tools of despotism of sovereigns and of persecution were carefully preserved in the Roman storehouse. There could be no doubt that they would be refurbished and fitted with new handles whenever they seemed likely to be useful. With many faults, the Holy See has never been wanting in candour. States, Protestant communities, and the laity in general may be considered to have received ample notice that the Church has never surrendered a pretension which may for a time not have been prominently advanced. Even on the issue whether the Church has always been the same, the advocates of ecclesiastical omnipotence have much to say. A Church which has the power to declare dogmas has the power to invent them, although it may be prudent to profess that they were always latent until the household exercised the privilege of taking out of his treasure-house things new and old. A community which has the right and power to remodel its organization remains the same when it has exercised its function of reformation. As a

sound Anglican, Mr. GLADSTONE must hold that the Church of England is *semper eadem*, although in the sixteenth century it renounced the jurisdiction of the Pope.

The controversy between Mr. GLADSTONE and Archbishop MANNING may no doubt possess theological or ecclesiastical interest; but it might have been supposed that a political leader would attend primarily to the practical inferences which may be drawn from his arguments, and to the issues with which the country and Parliament may have to deal. When the cloud of words is dissipated, the only question which is material to consider is whether the Catholic Emancipation Act should be maintained, repealed, or modified. Mr. GLADSTONE declares that he has no intention of trying to disturb the settlement; but a part of his pamphlet would seem directly to point to the withdrawal of concessions which, as he contends, were obtained under false pretences. His hackneyed quotations from the evidence and pamphlets of Bishop DOYLE only prove that Roman Catholic prelates fifty years ago neither foresaw nor approved by anticipation the eccentricities of Pius IX. If Dr. DOYLE had been asked whether he would submit to the dogma of infallibility if it were propounded by a General Council, he would probably have declined to answer a hypothetical question; but, if he had lived in 1870, he would have done what has been done by all his brethren throughout the known Catholic world. Lord ACTON indeed illustrates by the example of FÉNELON the facility with which Roman Catholic bishops of the highest type may cultivate two antagonistic sets of opinions at the same time, one in deference to the Holy See and the other as their private convictions. No one supposes that all the Roman Catholic bishops believe in infallibility, but they unanimously hold the doctrine *de fide*.

The Roman Catholics of the United Kingdom were admitted to civil rights, not on the testimony of Dr. DOYLE about their dogmas, but because it was unjust to exclude them, or, rather, because it was inconvenient and dangerous. Whether or not they ought, according to their creed, to be loyal, there they are, and they must be inside or outside the Constitution. Under the astute direction of O'CONNELL they made themselves intolerable as a persecuted class, and the Duke of WELLINGTON opened the door because he could no longer incur the responsibility of keeping it shut. On a smaller scale Mr. GLADSTONE may explain the Catholic Emancipation Bill by the analogous case of his own admission to the Cabinet of 1859. During the previous Liberal Administration he had been so formidable in opposition that Lord PALMERSTON wisely determined to keep him in office for the rest of his own life. He may perhaps not have been *semper idem*, but it would have been difficult to resist his attacks. What the statesmen of 1829 did under compulsion they ought long before to have done voluntarily. Roman Catholics, though some of their converts may profess the opposite opinion, are men and Englishmen before they are Catholics; or rather they, like the rest of mankind, act with little or no reference to their professed peculiarities of opinion. Nothing can be more absurd than to suppose that loyalty depends on scholastic niceties, such as the calculation of the number of angels who can dance on the point of a needle without jostling each other. No Roman Catholic will be less faithful to the QUEEN because one of the Popes wished to murder one of her predecessors. To impute to the professors of an unpopular faith an impossible consistency is but a caricature of the Ultramontane logic which has resulted in the dogma of infallibility. It would be easy to prove that Quakers ought to be disfranchised because their principles are adverse to fighting, or Jews because they will not work on Saturday. They would be extremely troublesome if they had a grievance, but in full possession of civil and political rights they are useful members of the community. The publication of Mr. GLADSTONE's pamphlet will have injured himself, and it will not in compensation have served any useful purpose, unless he thinks it a triumph to have put the POPE in a passion.

MINISTERS AT GUILDHALL.

IT would have been impossible for an English Ministry to dine with a Lord Mayor under conditions more happy than those which fell to the lot of Mr. DISRAELI and his colleagues on Monday. They have achieved since last Lord Mayor's Day a great political triumph, and one of

the fields of their greatest success was the City of London itself. Their success has also been one which no one grudges them, and which has been as welcome to their chief opponents as to any one else. They may easily feel the generosity of combatants who, after a victory, find no one to disarm. They have no difficulties, foreign or domestic, to encounter. England is prosperous, and at peace with all the world. Even the sanguine expectations of the CHANCELLOR of the EXCHEQUER will apparently be fulfilled, and a contented people will probably have once more its content increased by a popular Budget. A general buoyancy of spirit naturally coloured the views of every speaker. The Duke of CAMBRIDGE could see something like perfection in the army, and Mr. WARD LENT was as proud of his phantom navy as if he had created it. By a lucky accident foreign diplomacy found its spokesman in a Frenchman who had been educated in England, and the Count of JARNAC could employ eloquent as well as correct English when he expressed his admiration at finding Lord DERBY as industrious as he is rich, and his regret that in France either such men are not to be found or are not allowed to serve their country. Under circumstances so radiant every one was allowed to see everything through a rosy medium, and Mr. DISRAELI was only keeping up the harmony of the evening when he got so far as to say that he was pleased with the history of last Session. Nor was there the painful necessity which presses on weaker Ministries in less happy times, of speaking of the future, of awakening interest by revelations, and of giving promises and pledges. The Cabinet has begun its meetings for business this week, and the work of next Session must occupy some of the thoughts of the most elated of Cabinets. But Mr. DISRAELI kept that silence about the intentions of the Ministry which every prudent Premier seeks to preserve as long as he feels strong enough to preserve it. The past was touched with a vague gentleness, and if the Count of JARNAC had forgotten to keep up his knowledge of English politics during the period that intervened between his residing here in the reign of Louis PHILIPPE and his residing here now as Ambassador, he might have supposed that all the measures that have made England contented had been the work of the present Ministry or had received its cordial approval. The present, the glorious present, was enough for a Ministry which basks in its beams; and to carry the pleasantness of things to its utmost pitch, Mr. DISRAELI seized an opportunity of removing any impression there might be that differences existed in his Cabinet, and took care not to sit down until he had paid a graceful compliment to the administrative merits of Lord SALISBURY.

Mr. DISRAELI could scarcely make a speech of considerable length without selecting some topic that would enable him to go beyond mere platitudes, and on this occasion he selected as the subject of exceptional comment his old familiar friend, the Conservative working-man. Why, he asked, should not an English working-man be a Conservative? He may not have capital or land to conserve, but he has things more precious; immunity from conscription, immunity from arbitrary arrests, immunity from domiciliary visits, such as in some countries even noblemen have to endure. It is scarcely possible that this was not meant as a reference to the recent proceedings against Count ARNIM, and this reference might have been prudently omitted. To canvass the proceedings of a foreign Government during a pending trial which it has instituted does not seem the best way of promoting the friendly relations with the great Powers which Mr. DISRAELI expressed himself so anxious to maintain. Germany does not appear to have been represented at the LORD MAYOR's table; but if a German Ambassador had been present, he might have been tempted to ask whether it is really true that an English working-man is protected from arrest and domiciliary visits when he is accused before a criminal tribunal of having appropriated what does not belong to him; and he might have expressed some surprise at hearing an English PRIME MINISTER assume it to be something wonderful that a nobleman subjected to such an accusation should have been treated as a working-man would have been treated. But if this digression is omitted, Mr. DISRAELI was quite entitled to say that the working-men must have contributed to the late Conservative triumph. They did so, and they did so to a much greater extent than Liberals a few years ago would have considered possible. Experience has taught us to look at the working-man more as he is and less as what he was

imagined to be. Working-men, as a rule, do not think or care about politics at all, and naturally are largely guided when they vote by the general current of opinion in the ranks above them. They will be, it may be guessed, Conservative in Conservative times and Liberal in Liberal times. So far as they have opinions of their own, these opinions will be mainly determined by small and personal considerations. Few of them probably in February last thought much of not being treated like Prussian noblemen, or of not being made to wear a red coat unless they please; but many of them may have had a dim confidence that the Conservatives were the gentlemen least likely to stand between them and their beer, and least likely to bother them with compulsory education. This, however, is not all. Men, at least in quiet times, vote in a large degree from personal feelings. They obey habitual influences, and are guided by those to whom they ordinarily look up. The disposition of the working-men to be moderately content with existing institutions is the due reward of the earnest desire which so very many persons of wealth and station in the country have shown for years past to do what they can for those below them, and of the spirit in which the difficult task has been undertaken and carried on. It may be added that it is also in some measure the reward of the zeal which the clergy of the Established Church have shown for the education of the poor, and of the pains which the clergy have taken to know the poor and to show sympathy with them. The squire and the parson have no doubt in some places an influence which increased enlightenment and independence will dispel; but they have also an influence much more general which increased enlightenment and independence would only strengthen and confirm.

"That political Siberia in whose dreary recesses statesmen who are no longer wanted are sent to linger out 'the remains of a dreary and miserable existence'" is the description which Sir WILFRID LAWSON has given this week of the illustrious body for whom Lord SALISBURY returned thanks at Guildhall, and on whose behalf he found so much to say. Perhaps, if the secrets of the human heart could be revealed, it might be found that Sir WILFRID LAWSON would rather like to be made a Peer, and that Lord SALISBURY would not be sorry to find himself once more in the House of Commons. But, as things are, it falls to Sir WILFRID LAWSON to make the worst, and to Lord SALISBURY to make the best, of the House of Lords. For some strange reason the House of Lords is always spoken of with a perverse exaggeration which its admirers might not unfairly say is a proof how much Englishmen really like and think of it. When Mr. GLADSTONE went out of office about a third of his Cabinet removed themselves quietly into an assembly which their leader had hinted that, if he thought often enough, he might bring himself to suppress. The Conservatives chuckled at the sight of so many leaders of what they thought a revolutionary Ministry seeking an asylum in such a quarter, and said that Liberals must like the House of Lords very much when they showed such an eagerness to join it. Sir WILFRID LAWSON, on the contrary, sees in the House of Lords nothing but a political Siberia. The real truth hardly fits in with either of these ways of speaking. Among its many uses the House of Lords has the use of being a very good way of ending the career of politicians who have done well, but not very well. To Mr. GLADSTONE or Mr. DISRAELI the House of Lords would be something not far short of a political Siberia; but nothing could be less like Siberia to Lord ABERDARE or Lord CARDWELL. Everybody cannot be very clever, or very popular, or very indispensable. A man with competent fortune applies himself to politics in the House of Commons for a series of years. He is industrious, and can speak decently, and sticks to his party. He rises to Cabinet rank, and takes office with some success like Lord CARDWELL, or, if he fails like Mr. BRUCE, his colleagues may be conscious that his failure is not entirely his own fault. At last the time comes when such men have done all they can do, when younger men are pressing on, when they themselves have had enough of hard work, when in office they could only be what they are, and when out of office they could have no very great eminence or influence. They are in the position of good substantial QUEEN'S Counsel who think they are entitled at last to look to being made Puisne Judges. How are such men to have something like a Puisne Judgeship given them? The House of Lords supplies the answer, and a very good answer. They are made peers, and they get exactly what they want and

what they deserve. Most of what Lord SALISBURY said of the House of Lords is quite true. It is a popular, a respected, and a dignified body. It does a fair amount of gentle and useful work. It represents some of the weaknesses, and much of the greatness, of the English people. It confers an indisputable position on its members. It turns in a moment rather small people into rather great people. No institution that the world has ever seen could better supply politicians of the second rank with what they wish for and ought to have at the end of their career; and although the House of Lords answers many higher purposes, this is a purpose which it is of considerable importance to a nation to have satisfactorily answered, if men of honour, ability, and social standing are to take to politics as a profession.

THE CIVIL WAR IN SPAIN.

IT is always difficult to ascertain the true history of current military operations; and the uncertainty of Spanish news is greatly increased by the ingenuity of speculators whose object is not to assist either party in the struggle, but to cause a rise or fall in the price of Spanish stock. The latest telegrams, however, appear to leave no doubt that the Carlists have sustained a serious defeat. It was already known that, in consequence of the movements of General LASERNA and his lieutenants, the Carlists had wholly or partially suspended the bombardment of Irun, and that they had marched northward to meet the enemy. An engagement followed, in which LASERNA and LOMA succeeded in driving off the Carlists, and occupying their positions. The siege of Irun has consequently been abandoned, and Don CARLOS and his troops are said to have retreated into the mountains, and to contemplate a return to Estella. It is idle to pronounce on the result of operations which are but indistinctly narrated, and which may possibly even now prove to have been indecisive. The probability is, however, that the war is for the present virtually at an end. In his preparations for the relief of Irun General LASERNA seems to have displayed commendable energy. He sent a considerable body of men by forced marches to Santander, where they were immediately embarked for San Sebastian; and it is supposed that a simultaneous effort to raise the Carlist blockade of Pampeluna was also in view. LASERNA, a fortnight ago, visited Madrid in person for the supposed purpose of urging the immediate despatch of large reinforcements for the army of the North. The imminence of the winter season may probably have formed an additional reason for his anxiety to strike a blow against the enemy. The Carlist cause would have seemed comparatively hopeful if it had been found possible to take and keep the capital of Navarre. The insurgents have never hitherto succeeded in occupying and holding any considerable town.

The main object of attempting to take Irun must have been to intercept the most convenient line of communication between Spain and France. As readers of the Spanish correspondence in English newspapers know, the attack had been threatened during several weeks, as if for the purpose of inviting the Republican generals to take steps towards defeating the enterprise. As Irun is close to the French frontier, all the idlers in the neighbourhood had assembled on the right bank of the Bidassoa in the hope of witnessing the unusual sight of a bombardment. As if to increase the confusion, orders were sent from Paris to expel all the Spanish residents from the district; but it was found that the execution of the order would cause great and useless hardship; and afterwards the unfortunate exiles were allowed to remain. Irun is sufficiently defended to incur the risk of a siege; and yet the fortifications are not strong enough to offer serious impediment to a regular attack. The besiegers were unable to invest the place because it is accessible by water, so that there was no restriction on the introduction of supplies and reinforcements. Don CARLOS has been severely, and perhaps justly, blamed for bombarding a town which is principally inhabited by his own adherents; but the necessities of war are urgent, and even the Brussels Congress would have admitted that a place which is occupied by one combatant with a regular garrison is necessarily exposed to the attacks of the other. Happily the bombardment appears to have been of a very mild and innocuous character, and to have been attended with little loss of life. General ELIO, who had the chief command of the besieging army, is an experienced

soldier, and it must be assumed that his scheme had some practical object. It is possible that on his part also the operations on the Bidassoa may have been connected with the siege of Pampeluna.

There seems to be no doubt that, whatever may have been the case at a former time, the French Government now fully discharges the duties of good neighbourhood and neutrality. The Duke DECAZES has the good sense to abstain from foreign intrigues which could only involve possible collisions without strengthening either the French Government or any party in the country. It is announced that the FOREIGN MINISTER has caused an elaborate reply to be prepared to the Spanish Note, which collected all the complaints that could be urged against the French Government. It will perhaps be satisfactory to prove by official documents that no undue favour has at any time been shown to the Carlists, but it is more material to pursue at present an unobjectionable policy. The duties of a neutral in the immediate neighbourhood of the scene of civil war are embarrassing and ambiguous. Much discretion is required in the attempt to avoid offence to the Government of Madrid, and at the same time to act fairly to the Carlists, who, although they are not recognized as belligerents, are at the same time not regarded by France as enemies. In one respect the French Government is more favourably situated than England was during the American Civil War, for the Spanish Government is not likely to enforce remonstrances by threats. If France were ever to give active support to the Carlists, Marshal SERRANO would have no practical means of expressing his resentment. The fable of intended German intervention has long since been exploded; and the French Government is at liberty to act on its own views of its honour and interest. There can be little doubt that the present Ministers would gladly see the termination of a barren contest. The expense and trouble of guarding the frontier and of preventing breaches of neutrality are thankless and utterly unprofitable. The Legationists themselves must by this time have arrived at the conclusion that, except through vague sympathy with Don CARLOS, they had no ground for desiring the prolongation of the war.

The best reason for wishing that the Government of Madrid may prevail in the contest is that its victory is not impossible, and that its success would put an end to the struggle. It was on this ground that the European Powers, with one exception, agreed to the proposal of Germany that the Government of Marshal SERRANO should be recognized. If Don CARLOS had a party in the different Spanish provinces, and if he were advancing on Madrid instead of cannonading a town on the French frontier, the bigotry and despotism which he more or less openly professes would not concern foreign Governments. It may be assumed that Russia, which alone withholds recognition, would prefer the enthronement of a legitimate Pretender to the establishment of a Provisional Government which calls itself a Republic; yet it is now alleged that the Emperor ALEXANDER has entered into communications with SERRANO, and that he is disposed to follow the example of Germany, France, and England. A war in Spain cannot possibly affect the prosperity of Russia; and it is only one of many causes which depreciate the prospects of the English creditors of Spain; but Governments acknowledge a certain moral responsibility for the exercise of influence in the affairs of their neighbours. Lord PALMERSTON forty years ago aided CHRISTINA and ISABELLA against the grandfather of the present Pretender, because he considered that it was for the interest of England to maintain constitutional government in Western Europe. During a part of the old Carlist war it seemed highly probable that the Legitimists would succeed in driving their opponents from Spain, if England and France remained neutral. A similar contingency would at this time be regarded with indifference; but it will certainly not occur. It is intolerable that a civil war should last for years, when it can only terminate in one result. The Northern provinces, in which alone Don CARLOS can hope to maintain himself, are not sufficiently large or populous to form an independent State; and even if the inhabitants were unanimous in his favour, they can have no pretension to impose their will on the rest of Spain. The war must at last end as it seemed to have ended when Don CARLOS was said only a week ago to have abandoned his army. It is for the interest of all parties that the consummation should be attained as soon as possible.

ITALY.

THE condition of Italy is one of the few topics on which Liberals can now touch with unmixed satisfaction, and Mr. BAXTER has studied Italy with sufficient attention to make his picture of the Peninsula attractive and interesting. A Scotch audience was sure to hear with delight that cabdrivers in Italian towns hate priests, and that at Naples ecclesiastics seem to be disappearing with the bad smells of the place. But any audience is awakened to sympathy by the utterances of honest enthusiasm, and Mr. BAXTER is so enthusiastic a friend of Italy that the Italian population generally seems to him to look as if it washed more than before it had VICTOR EMMANUEL for its King. But if he is enthusiastic, Mr. BAXTER may safely say that his enthusiasm rests on a basis of solid fact. His picture of Italy is as true as it is glowing. The activity, the life, the energy of emancipated Italy are prodigious. When Mr. BAXTER said with glee that the progress he saw at Rome reminded him of the United States, he used a comparison which few except Scotch working-men could listen to without a shudder. But there is a real foundation for the comparison between modern Italy and the United States. The Italians have really had a new birth, and have an ardour of youth which is of the true American type. They have gone ahead by leaps and bounds; and the wonders of Chicago are almost rivalled by the rapid growth of cities which, like Genoa, Leghorn, and Rome, seemed a few years ago sunk in a mild decay and verging on a dreary death. It may be added that although, like the Americans, the Italians have their rowdies, their Sicilian Texas, their rival platforms, and their passion for local jobs, yet, like the Americans, they have a profound faith in their institutions, and manage to keep them going, and are carried through little difficulties by cherishing a great purpose. Nothing in Italy is more remarkable than that so many different provinces, separated for ages by barriers of government and geographical obstacles, should not only have united, but should show so very generally the same happy consequences of union. Material prosperity displays itself everywhere, and, as Mr. BAXTER said, even at Venice they are building new houses and dredging the canals. Eighteen millions sterling have been paid for the purchase of ecclesiastical estates, and this speaks much for the wealth of Italy and for its future advance in riches. Italy is and always must be essentially an agricultural country. It has no manufactures. It has neither iron nor coal. But it has a splendid seaboard, and almost inexhaustible capacities in regard to climate and soil for producing the best fruits of the earth. When the St. Gothard Tunnel is made, Genoa will be the port of a large district of Germany and Switzerland, and the Venetians hope to see Venice displace Trieste as the centre of the trade of the Adriatic. But Italy is, with these exceptions, its own market, and Italy, like France, can only grow really rich by making the most of its own soil. France has lately shown how solid and vast may be the wealth of a country in such a position, and a few more years of activity, peace, and good government would place Italy not far behind France in the stable possession of agricultural wealth.

"Brigandage," Mr. BAXTER informed his friends at Dundee, "is not compatible with free institutions." Nothing, unfortunately, could be more untrue, as Mr. BAXTER might easily find to his cost if he made a tour through Mexico or any of the Republics of Central America. What brigandage is not compatible with is an active population and a strong government. It is because in every corner of Italy the people are beginning to exert themselves, because roads and railways and harbours are being constructed, and because the Government is determined to put brigandage down, that Italy may look forward to the day when it will be free from its ancient curse. The policy of the present Government is a policy of stern repression, and a Ministerial majority means a majority in favour of stronger measures than have as yet been tried. The present Government also insists on the necessity of looking at Italy as a whole, and not sacrificing the national credit to hampering the whims or consulting the wants of separate localities. The policy of the Opposition is to uphold local independence and personal freedom. There are a few representatives of the ecclesiastical power in the ranks of the Opposition, and a few Republican fanatics. But the mass of the Left do not wish to quarrel with the dynasty of Piedmont, and they blame the Right for not treating priests as harshly as they deserve. The real struggle between the parties is a struggle between those who wish for

free institutions with a strong central Government and those who wish for free institutions with a weak central Government. All Italians, with exceptions not worth noticing, are in favour of a united Italy, antagonism to the priests, the retention of Rome, and Parliamentary government. So far it may be said that all Italy is for free institutions. But after that point is reached there is room for considerable divergence. The Right wants the Government to be able to act sharply and promptly; it urges that in finance the first thing is to uphold the national honour, and that Italy should steadily pay its creditors, and, what is more, should make its creditors sure of being paid. The Left does not approve of processes out of the sphere of ordinary law; it prefers that brigands should be acquitted by juries rather than that they should be condemned by military magistrates; it insists that localities which make great sacrifices to pay national taxes should have some little compensatory favours accorded to them. All Italian politics have so strong a Liberal tinge, if the present state of Italy is compared with the past, or if Italy is compared with most of its neighbours, that it is in one way quite true to say that the struggle is only between Liberals of two different shades. But the struggle is nevertheless a serious and important one. Any one who read Mr. BAXTER'S speech might naturally think that Italian prosperity went on without embarrassment and like a machine; and if our attention is confined to general results, there is some reason for using such language. But if we look at the process by which Italy is made to advance, we see that Italian statesmen have many difficulties to overcome, many failures to deplore, many jealousies and much ignorance and apathy to conquer. When the real working of the free institutions of Italy is studied, the wonder is not that there have been so many Ministerial blunders and catastrophes, but that an intelligent and reasonable policy has been on the whole so steadily and so successfully pursued.

The elections held last Sunday have shown a general result favourable to the Government. The system of voting which requires the successful candidate to poll a third of the electoral body, and forces him, if he fails to do this, to a second trial of strength, seems to answer no obvious purpose, and the number of those actually voting compared with the number of voters inscribed seems strangely small. A Correspondent of the *Times*, writing from Venice, describes the apathy that prevailed there, and as in nearly half the electoral colleges of the kingdom the highest candidate failed to secure the support of a third of the inscribed electors, it might seem as if this apathy had been general. But the impression appears to prevail in Italy that the elections have been well contested, and have excited an unusual amount of interest; and the failure in so many places of the highest candidate to obtain the necessary third is probably to be attributed to the electors thinking the man they preferred so sure to win that they did not take the trouble to vote for him. General LA MARMORA, for example, got 299 votes at Biella, and his opponent only five, and yet there is to be a second election held. Florence elected BICASOLI, PERUZZI, and two other less distinguished members of the Right, and there was practically no opposition; and yet these four candidates have to be balloted for to-morrow, because the number of voters supporting them was insufficient. At Rome, again, none of the elections held last Sunday was final; but there was some warmth in the contest, and if both parties were active, it certainly seems strange that in no case should the successful candidate have obtained the necessary third. In two districts of Rome GARIBALDI was proposed, and it might well happen that many Italians would like neither to vote for GARIBALDI nor to vote against him. But in another Roman college a Jew was at the head of the poll, and it seems curious that a body of Romans should not have made up their minds whether they wish a Jew to represent them or not. It is calculated that, when all the final elections have been held, the Government will have a majority of at least sixty, and this in a Chamber of 508 is as large a majority as a prudent Prime Minister would wish. It is very useful to a Government, for the purpose of keeping its supporters together, that the Opposition should not be too weak; and it is to be observed that the greatest gain of the Government has been in Piedmont and Lombardy and Tuscany, districts which are perfectly free from brigandage, while in the Romagna parties remain as before. The only two colleges

at Naples where a final result has been obtained have returned members of the Left, and in Sicily the Opposition is expected to gain seats. In other words, strong measures against brigandage are supported in provinces which they will not touch, and are opposed, or at least questioned, in provinces which they will touch. This is by no means a result which a Government sure of a working majority need regret. It is a very good thing for Italy that it should have a strong Government, but it is also a very good thing that the measures of this Government and its acts should be closely watched and narrowly criticized by those who represent the districts where its action is to be most immediately felt.

MR. STANSFELD'S CRY.

THE inertia from which the Liberal party is at present suffering may perhaps be measured by the violence of the efforts which are made to galvanize it into some manifestation of vitality. While the majority of Liberals are apparently content to remain passive, the more restless and enterprising spirits are poking about in all directions for some outlet for their uncomfortable activity. It may be remembered that Mr. STANSFELD, in the closing days of office, propounded the theory that the great object of the Liberal party was to keep itself going, and that it must therefore take care always to have some good question on hand in order to provide itself with something to do and to justify its existence. Now that Mr. STANSFELD is out of office he has more leisure and liberty to carry his theory into practice. He has at last got a cry which he thinks will answer the purpose. It is a cry out of the depths, and from a depth which is painfully suggestive of the difficulty of finding one. Mr. STANSFELD has come forward as the leader of an agitation against what are known as the "Contagious Diseases Acts." The original law on this subject was passed in 1864, when Mr. STANSFELD was a Junior Lord of the Admiralty; and he was also a member of the Government by which the operation of the law was strengthened and extended, and by which it was consistently enforced. It appears to have been only lately that Mr. STANSFELD has discovered the full iniquity of this legislation, and of course he now enjoys more freedom in the expression of his private opinions. The question is one on which, as on most other questions, it is possible for conscientious persons to entertain different opinions, and Mr. STANSFELD and his friends have clearly a right to form their own conclusions as to the operation of these Acts, and, if they think that their operation is injurious, to use their influence to get them repealed. There are, however, some considerations which cannot be ignored, and which necessarily affect the manner in which the question should be treated. Mr. STANSFELD, in a speech at Sheffield on Wednesday, asserted that the Contagious Diseases Acts had been smuggled through Parliament, and that laws which had been passed without the sanction of public opinion, and without that preliminary discussion which the laws of Parliament are intended to receive, had no claims on the obedience of the people. It is scarcely possible to suppose that Mr. STANSFELD intended seriously to say that a law which has been passed by Parliament is not binding on any one who chooses to imagine that it was not discussed so fully as he happens to think desirable. There can be no doubt that the Contagious Diseases Acts were passed through Parliament very quietly, but that is a different thing from secretly. Mr. STANSFELD himself was in Parliament when the Acts were passed, and he must have been perfectly aware of what was being done. If discussion was avoided as much as possible, it was not from any desire of concealment, but simply because the subject was a very nasty one, which could not be ignored, but which all decent people wished to think and talk about as little as possible. This feeling, we imagine, still prevails, but Mr. STANSFELD does not share it or respect it. He calls for a vigorous stirring up of the unsavoury pool. It is to be thrust under everybody's nose. Nobody is to be allowed to remain in peaceful ignorance of its existence. There is to be a revival of the fanatical agitation by which a year or two since not only public decency but domestic privacy was cruelly outraged. A question which everybody would gladly avoid is to be made a subject of popular debate, and the family breakfast-table is to be covered every morning with a shower of pamphlets and circulars of the most revolting character.

This is a kind of agitation against which, on every

ground of decency and fairness, we wish to protest in the strongest possible way. It may be said that this is an affectation of modesty which is put on only as a pretext for stifling discussion. But it is not discussion that we object to. There is no reason why there should not be discussion of the fullest and freest kind; only let it be entrusted to competent persons, who are capable of forming an authoritative judgment on it. The subject is clearly unsuited for loose popular agitation; in the first place, because it is one which cannot be plainly discussed in that way without giving an unnecessary shock to many persons who have every title to be preserved from it; and in the next, because it is a question on which the opinion of an ignorant and passionate audience, excited by inflammatory statements the grounds of which cannot be tested, is obviously of no value. When similar questions come before a court of law they are disposed of *in camera*, and that is the course which should be followed here. When Mr. STANSFELD says that every effort has been made to prevent the discussion of these Acts, he forgets that three years ago there was a Royal Commission on the subject, which made a thorough investigation and published a voluminous body of evidence. Mr. STANSFELD now professes to be very anxious for a scientific treatment of the question, but it is significant that, when the Commission was sitting, among the witnesses summoned at the instance of the Association for the Repeal of the Acts there was not one single medical officer of either service. It was then, and is, we believe, still, the unanimous and decided opinion of the medical officers of the army and navy—that is, of those who have the best opportunities of observing the actual working of the system—that it is extremely valuable from a sanitary point of view. The Commissioners state that the Acts “have purged the towns and encampments to which they have been applied of miserable creatures who were masses of rotteness and vehicles of disease, providing them with asylums where their sufferings could be temporarily relieved, even if their malady was beyond cure; and where their better nature was probably for the first time touched by human sympathy.” And they add that they are convinced that the number of the women reclaimed, directly or indirectly, by the operation of the Acts, must be considerable, and that they had also had a strong deterring influence in regard to clandestine immorality. It is true that the Commissioners, while they could not resist the overwhelming evidence of the extremely beneficial operation of these Acts, recommended that they should be partially repealed as a concession to what they supposed to be “the sentiment of the people.” It is important, however, to observe that, though they gave way to a weak compromise in their conclusions, the Commissioners laid it down in the most emphatic and decided manner that “special regulations for the treatment and control of a class of persons frequenting certain districts, under conditions calculated to engender and propagate disease, are alike just and expedient,” and that they saw no moral grounds on which such regulations could be resisted. The most important result of this Commission was, of course, the evidence which it collected, which is summed up by the Commissioners in the passages we have quoted, and which is open to any one to read and digest for himself. Whether or not the regulations are or ought to be offensive to the “moral sense” of the people is of course a question on which any one can form an opinion as well as the Commissioners, and the Commissioners merely assume its existence without attempting to justify it.

There are several grounds on which these Acts are now assailed—first, that they are immoral; secondly, that they are unconstitutional; and, thirdly, that they are practically a failure. The last of these arguments is perhaps the only one which it is necessary to discuss. The Acts were passed in order to meet an exceptional evil of a particularly urgent kind, and the question is whether they have really had a beneficial effect. The evidence on this point will appear to most persons to be conclusive, but of course, if Mr. STANSFELD or any of his associates have any testimony to produce on the other side, they are entitled to bring it forward. This should be done, however, not before a tumultuous audience, having no acquaintance with the subject and no opportunity of testing the sweeping statements put before them with all the adornment of sensational rhetoric, but before a tribunal where it will be patiently and calmly examined and impartially weighed. Mr. STANSFELD does not make it quite clear how far his “moral sense” would compel him to oppose any attempt to

check the ravages of a loathsome and dangerous disease. In one place he declares that, whatever their hygienic results may be, the Acts must be got rid of as immoral; while he had previously offered, “when the laws have been repealed,” and not before, when we have a *tabula rasa*, and can start “fresh,” to consider any proposals which the Government may make for dealing with the subject. Those who hold that it is immoral to attempt in any degree to alleviate the consequences of vice, even for the protection of the innocent part of the community, will of course oppose any regulations of the kind now in force. Those, on the other hand, who are willing to argue the question on the ground of practical expediency, are bound to show that, in point of fact, evil, and not good, has resulted from the experiment. In any case, vague declamation and unsupported assertions can only do harm.

THE REACTION IN AMERICA.

THE political reaction in the United States has much external resemblance to the change which resulted from the last general election in England. In both countries the winners and the losers were equally taken by surprise. It also happens that the triumphant Opposition calls itself in America, as in England, Conservative; but the Democrats are not divided from the Republicans by any broad or definite difference of opinion. The dissatisfaction with Mr. GLADSTONE'S Government which displayed itself at the election was in some degree provoked by administrative failures, and perhaps by the personal unpopularity of one or two of the Ministers; but the real cause of the revulsion of popular feeling was the irritation produced among many classes by the restless character of Mr. GLADSTONE'S policy and professed opinions. It had become impossible to rely on the determination of the Government to perform the primary duty of resisting agitation and of maintaining existing institutions. The Prime Minister had not distinctly intimated his adhesion to the principle of universal suffrage; he had addressed menacing language to the House of Lords; and, when he had in a powerful speech defended the Established Church against its assailants, he allowed his nearest relative soon afterwards to assure a public meeting that the meaning of his vigorous and perspicuous language had been by some strange casualty misunderstood. Except in relation to the Southern States, no disturbing or revolutionary tendencies can be attributed either to the Republican party in Congress or to the President. It is not known that the leaders of the majority would have proposed any legislative measure of importance if they had retained their preponderance in the next Congress. On the question of currency both parties are divided among themselves, though the late policy of inflation was chiefly promoted by the Republicans. The most creditable act of the PRESIDENT during his six years' tenure of office was his rejection of a Bill for the increase of the paper currency and for the consequent postponement of a return to specie payments. His policy was approved by the most competent judges of the question, but it was condemned by sections of both political parties.

The change in the comparative strength of parties in the Legislature is disproportionately greater than in the constituencies. The Democrats formed two years ago two-fifths of the whole number of voters, and they are now more than half. The consequence is that in the next Congress they will have converted their minority of a hundred into a majority of more than fifty. The Americans are the only competent judges of the character of their own institutions, but foreigners can scarcely be mistaken as to the inconvenience which results from the almost exclusive representation of majorities which may perhaps be locally and collectively small. If the Republicans had not for many years exercised uncontrolled supremacy in the Senate and in the House of Representatives, they would probably have been more prudent, and they might now be less unpopular. The neutral or wavering politicians, who are the most respectable and the most intelligent part of the population, have been temporarily alienated from the Republican cause by the indifference of the dominant party to political morality. It is true that soon after the war the leaders of the majority were more shameless and more audacious than at a later time, but as long as the memory of the struggle was recent the party which was supposed to have sympathized with Secession was necessarily excluded from power. Six or seven years ago, under the leadership of a vulgar dema-

gogue, the House of Representatives, by an almost unanimous vote, approved of the practical repudiation of the National Debt. In the late Session of Congress the majority was contented to perpetrate a petty injustice by voting for the inflation of the paper currency. The increase of the salaries of members of Congress has involved greater unpopularity than measures which were intrinsically more objectionable. There may have been good reasons for raising the pay of members, who have generally but small resources of their own; but in voting to themselves arrears of salary on the new scale they gave reasonable offence to their constituents. Mr. THADDEUS STEVENS and General BUTLER have, jointly or in succession, for more than ten years been the most conspicuous chiefs of the dominant party. It is not surprising that the community should at last be anxious for a change, although there is no eminent Democratic politician who has any claim to public confidence. It is not yet known whether Mr. SCHURZ, who is a Liberal Republican, will be recognized by the Democratic majority as an ally. The elections have conferred an unmixed advantage on the country by excluding for the time from power the MORTONS, the CONKLINGS, and the other active politicians who had hoped for another term of patronage and influence. It unluckily happens that none of the successful candidates could even by flatterers be described as statesmen.

General GRANT, who must now abandon all hope of reelection, has perhaps contributed to the defeat of his party by his ambition for a third term of office. The PRESIDENT is on the whole superior to his political associates; and there is some reason to believe that he has acquired by experience a knowledge of affairs in which he was formerly deficient. It is an advantage to the head of a Government to understand his business, and the fear that the prolongation of his power might endanger the Republican system was both unfounded and insincere; but the people of the United States are perhaps well advised in abiding by their political traditions, and the growing unpopularity of the Republican party could only be aggravated by the projected innovation. Hereafter GRANT'S administration will be remembered without strong admiration or censure. When he was first elected he desired to break through some of the trammels which had impeded the free action of his predecessors; and he selected his first Ministers on his own independent judgment. The Republican managers immediately caused the PRESIDENT to feel their displeasure; and, after a short interval, he acquiesced in the system of jobbery which constitutes the main object and the most effective machinery of the Federal Government. The PRESIDENT himself might probably have favoured the reform of the Civil Service; but he soon found that in retrenching the means of corruption he would alienate his supporters. He even adopted as his principal adviser General BUTLER, whose military capacity he had publicly ridiculed, and whose moral and political character he must have well understood. In the Southern States the PRESIDENT countenanced the misgovernment of Northern adventurers and of coloured demagogues who depended on the favour and protection of the Federal Government for defence against the just indignation of their own neighbours and fellow-citizens. General GRANT'S support of the impudent adventurer KELLOGG in Louisiana was probably one of the causes of the reverse which has befallen the Republican party.

Some of the local changes which form a part of the general reaction are interesting, though they are not uniformly satisfactory. General DIX, who has been defeated as candidate for the office of Governor of New York, was one of the most creditable members of the Republican party, and during his present term of office he has administered public affairs with integrity and success. It is significant of the state of public opinion that his opponents thought it expedient to denounce him as an aristocrat, or, in other words, as a gentleman. His successful competitor, Mr. TILDEN, is also personally respectable, and he took an active part in the prosecution of TWEN and his accomplices; but it is ominous that the club which derives its name from its place of meeting in Tammany Hall has once more recovered its ascendancy in the city of New York. The notorious prizefighter MORRISSEY seems to be recognized as the leader of the Democratic party in the city; and it may be expected that the ancient system of spoliation and misgovernment will shortly be revived. Massachusetts has at last been relieved from the discredit of returning General

BUTLER to Congress. Only a few months have passed since he was defeated in a contest for the Governorship of the State; and now even the faithful and long-suffering electors of his district have become tired of perpetuating a political scandal. It is not a little surprising that a Democrat has been elected Governor of Massachusetts. The English advocates of compulsory abstinence will regret to learn that the Republicans attribute their defeat to the unpopularity of the prohibitory liquor law. It is not improbable that the better part of the population of the State may have deserted the Republican party in indignation at the corruption and insolence of some of their leaders. The invention of supposed Southern outrages in preparation for the elections was a device which recoiled on its ingenious authors. Massachusetts is not likely to become permanently Democratic; but, if the claim of its citizens to the possession of superior intelligence and morality is well founded, they may well have desired to administer a rebuke to the followers and allies of BUTLER. The new majority will after a short interval command the Senate as well as the House of Representatives, and it will probably hold together long enough to return the next President. Whether it will pursue the Free-trade policy which has been usually professed by the Democratic party is at present uncertain. The most immediate and important result of the reaction will be the recovery by the white population in the Southern States of their natural superiority.

THE FRENCH ELECTIONS.

THERE is nothing new to be said about the French elections of Sunday last. The Bonapartists were victorious in one department, the Republicans were victorious in two. In the Oise the Duke of MOUCHY has beaten both the Republican candidates put together, and beaten them handsomely. Of course the DUKE was chosen to contest the department because he was likely to win, and so far the Republican journals have cause to say that the election was not decided on purely political grounds. After all, however, this is not much to the purpose. No one pretends that the Imperialist cause is an object of so much enthusiasm that the electors will simply ask which is the Imperialist candidate and then rush off to vote for him. What is shown by these Bonapartist successes is that to be an Imperialist is no discredit to a candidate whose chances are otherwise good. It is not so very long since, except in Corsica, any Bonapartist who wished to become a deputy had to go about among the constituencies in disguise. Before he could indulge a hope of being elected, he had, so to say, to forge his passport. He found out that his adherence to the Empire had been merely a form of devotion to the monarchical principle, or to the principle of popular sovereignty, or to Free-trade, and now that the gold could be had without the alloy, he was simply a Royalist or a Republican or a Free-trader. Even with these painful explanations, it was no easy matter to find a constituency which would give a man suspected of Imperialism a decent minority of votes. All this has been completely changed. The Bonapartists have again become the noisiest and the most active party in France. They have their candidates ready at every election. They make no secret of their ultimate wishes and intentions. They criticize the Republicans with as much freedom as though they were already in power. And the action of the electors goes some way towards justifying this bold attitude. Not only does the Duke of MOUCHY get nearly 54,000 votes, while M. ROUSSELLE and M. LEVAVASSEUR between them only get 36,000, but in the Nord their unsuccessful candidate, M. FIEVET, gets 102,000 votes against some 119,000 given to the Republican candidate, M. PARST. It has been observed that the Bonapartist journals have made much less noise about their victory in the Oise than they made about their defeat in Seine and Oise. They accept the 54,000 votes for the Duke of MOUCHY with becoming meekness, whereas their heads were almost turned by the 45,000 votes for the Duke of PADUA. As success seems to be coming nearer, they are learning not to compromise their prospects by premature exultation. They know that their recent victories are not entirely due to their own merits. If they have given valuable support to the Government, they have received a good deal in return. The electors who vote for the Bonapartist candidates are not all Bonapartists. The supporters of the

Septennate must vote for somebody, and as it is useless to bring forward a candidate of their own, they prefer the Bonapartist to the Legitimist or Republican candidate. The former is at least willing to leave France without a settled Government six years longer, whereas the two latter want to create one immediately. As a rule, therefore, it is important for the Bonapartists not to say too much about their triumphs. If there are any feeble-minded electors who thought that, in voting for the Duke of MOUCHY, they were merely voting for Marshal MACMAHON, so much the better. Why make their minds uneasy by showing them the full significance of what they have done? It is the fable of the man and the horse over again. The more modest the Bonapartists show themselves, the more chance there is that the Conservative electors will stand quiet while they are mounting. Their own more hot-headed supporters have occasionally to be considered, and a little quarrel such as that between the Government and the Duke of PAU is useful as showing that the party is not disposed to put up with too many slights. But, speaking generally, the more they identify themselves with that general Conservative feeling which has placed Marshal MACMAHON at the head of affairs, the more they advance their own special interests.

Would the Duke of MOUCHY have polled as many votes if there had been only one Republican candidate, and that candidate had been M. LEVAVASSEUR? The defeated party would probably give a good deal to be able to answer this question. It is easy to see that M. GAMBETTA, though he is usually able to rein in his followers, has occasionally to give them their head, or to stand the risk of their breaking away altogether. The important thing to ascertain is, when this occasional license can be most safely conceded. M. GAMBETTA seems to have imagined that the Duke of MOUCHY's outspoken Imperialism would leave him in a minority compared with the aggregate Republican vote, and consequently to have thought that the experiment of dividing the party at the first ballot and uniting it again on the second might be tried with a good hope of success. The Conservative Republicans would vote, it was assumed, for M. LEVAVASSEUR, the Radicals would vote for M. ROUSSELLE, and whichever had the fewest votes would retire after the first trial. The result of this experiment was that the two candidates together only got about two-thirds of the votes given to the Duke of MOUCHY. It may be that the Republicans altogether miscalculated their strength in the department, and that under no circumstances would they have had any real chance of victory. It may be, however, and this is perhaps the more probable explanation of the two, that many of the electors who would have supported M. LEVAVASSEUR if he had been the only Republican candidate were frightened at M. ROUSSELLE's appearance, and did not choose to run the risk of having him for a representative. The result of the election is very well fitted to strengthen this alarm, supposing that it really existed. M. ROUSSELLE might have stood without doing any harm to the Republican prospects in the department if he had been willing to retire in the event of not being elected at the first ballot. But, as he not unnaturally objected to make over his votes to M. LEVAVASSEUR unless M. LEVAVASSEUR could make good his title to them by proving himself the favoured candidate of the party, the Conservative Republicans, if the Duke of MOUCHY had failed to get an absolute majority, would have found themselves in an awkward predicament. M. ROUSSELLE, as it happened, polled rather more votes than M. LEVAVASSEUR. If M. LEVAVASSEUR had insisted on standing again, the Duke of MOUCHY would have won on the second ballot in virtue of his relative majority. If, however, as would no doubt have been the case, M. LEVAVASSEUR had retired rather than let in an Imperialist, M. ROUSSELLE would have been the only Republican candidate, and in that character might have been elected. It is quite possible that many of the Conservative Republicans foresaw this possible result, and were anxious to defeat it beforehand. If the lesson is taken to heart by the Extreme Republicans, the defeat will be of more use to the party than a victory would have been. The latter could but have given them one more representative in the Assembly, and his seat would have been gained at the sacrifice of several others. To persuade an extreme section of a party to continually efface itself in order that the moderate section may secure the return of its candidates is an extremely difficult task, and M. GAMBETTA would hardly be able to accomplish it if he could not from time

to time point to actual experience for evidence of the ill effects of a contrary policy.

On the 22nd of November, the Municipal elections will be held over the whole of France, with the exception of Paris. The Government may be supposed to have fixed this date with the view of impressing the Assembly with the strength of the Conservative party in the country. The election will take place under the new and more stringent conditions of registration adopted last Session, and the mayors appointed by the Duke of BROGLIE have been long enough in office to make their influence felt. In addition to this, the recent elections to the Councils General showed that in local elections the candidate in possession and the candidate who has property in the neighbourhood have each great advantages. It is hard enough to get a French peasant to vote on purely political grounds in an election for a body whose principal business is politics, and naturally enough he is still less disposed to vote on purely political grounds in an election for a body whose principal, and indeed sole, business is to look after the affairs of the village. All these circumstances taken together are likely to give a highly Conservative complexion to the elections on the 22nd, and considering how small an amount of support the Government can command in the Assembly, it may well wish to show a semblance of support out of doors.

THE "ENGLISH GOSPEL."

THE Indian Correspondent of the *Times* has lately sent home an interesting letter on missionary life, and a remarkable commentary on his letter appeared in the *Pall Mall Gazette* of Monday last. The writer of that article points out that, whether the effect of missionary efforts on the people of India be small or great, the government of India by the English must bring about one of the greatest moral, social, and religious revolutions known in history. The religious belief and the cherished institutions of nearly a quarter of the human race are being destroyed. The Hindoos and the Mahomedans had worked out a sort of *modus vivendi* under which their several faiths could somehow coexist. The order of things set up by the English is utterly opposed to both creeds. What will come of this? "What will this vast mass of men believe and practise now that they are practically enabled to say, think, and do whatever appears good to them, external violence apart?" The answer to this question must a good deal depend on the nature of the creed which is offered to the people of India by their revolutionary masters. The writer of the article undertakes to describe what this English creed is. It insists, he says, upon obedience to law, upon universal toleration, and upon the teaching of physical science. It says to the natives, You must not commit crimes, or break contracts, or persecute those who are not of your creed, or who, being of your creed, choose to leave it or to offend against its principles. And physical science is so true that we shall publicly teach it in our schools, although it expressly contradicts and stultifies Hindooism, and although the method in which it is taught and the temper of mind which it encourages are practically fatal to other native creeds and not easily reconcilable with Christianity. This is our English gospel." This is what we will believe, this is what we will enforce, this is what every one who wishes to be employed or to live comfortably must practise. Whoever neglects it will find that the world will pass by him, that he is out of harmony with his neighbours, that his sons will take up other views, and that the more active and compliant part of the population will get the better of him. "Whosoever rebels against it shall be hanged, shot, or blown away from the cannon's mouth, as may be most convenient under all the circumstances of the case."

The magnificent self-assertion of this revelation is exceedingly imposing, and it is not until the results of it have been studied for some little time that any doubt suggests itself as to their being altogether admirable and beneficent. About the fact of the revolution which is going on in India there can be no question. In their present and popular form—in the form, that is, in which they supply moral and social guidance to some two hundred millions of people—the Indian creeds can hardly long endure the contact of English ideas. That at present the missionaries sent out by the various Christian bodies of Europe and America have not provided the natives with any creed which can take the place of those which are destined to

disappear seems to be equally certain. The best missionaries have the fewest converts to tell of, and from this it may fairly be inferred that the converts made by inferior, but apparently more successful, workmen are not much to boast of. If the English gospel, as described in the *Pall Mall Gazette*, could be accepted as a thoroughly satisfactory substitute for Hindooism, Mahomedanism, and other Eastern religions, it would very much lessen the anxiety with which the emancipation of the people of India from all the beliefs hitherto held by them must otherwise be watched. "The reason why Christian missions 'have so very little direct effect in India'—it is the writer in the *Pall Mall Gazette* who is speaking—"is that 'they do not represent the real teaching of the English nation.' That teaching, as we have seen, is summed up in a few simple rules. Obey the laws, persecute nobody, learn physical science, or submit to be beaten in the race of life, or, if you openly rebel, to be hanged, shot, or blown away from a gun. When this, 'the real teaching of the English nation,' is presented to the natives, what influence will it have upon them? This knowledge and such a smattering of physical science as is likely to be gained by a population which has to work very hard to earn a bare subsistence are to stand in the place of religion, and of so much of morals as lies outside the region of law. Granting that the substitution will be effective so far as the English rulers of India are concerned, that it will secure submission to the Government and a certain amount of compliance with the statute law and the decisions of judges, what will be its effect upon the natives in all those relations of life which do not come within the sphere of municipal law? If they accept this English gospel as the crowning product of European intelligence, will they not find that its scope is strangely small; that it leaves all that most nearly touches their happiness altogether out of consideration; that when a man has learnt by experience or observation that if he breaks his contract he will have to pay the penalty, or that if he mixes alkali with acid it will effervesce, there will remain problems to which this creed affords no solution? Again, what warrant is there for thinking that so restricted a gospel as that described by this writer will be efficacious even for English purposes? A gospel which rests entirely on self-interest or on the fear of the cord and the cannon-ball is clearly deficient in some important elements. When the writer mentions blowing away from the cannon's mouth, as the last and worst punishment the law can inflict, he perhaps forgets that this mode of execution depends for its special terrors on the religious belief of the Hindoos. When the native has mastered the English creed, and learned that it is absolutely unimportant in what way the atoms which make up a man are dissolved into space, the list of serviceable penalties must certainly be shortened by one.

There is another consideration of equal, if more remote, importance which bears upon this question. The permanence of English dominion in India depends upon its being maintained with a sincere purpose of governing the country for the good of the inhabitants. If this idea were once lost sight of, if India became a mere gold-digging or diamond-field to which Englishmen resorted to make money in the shortest possible time, the laws which the natives of India are made to obey would by degrees change their character. Disobedience or resistance to the governing race would be punished as severely as ever, but crimes which affected only the natives themselves would be regarded with disinterested neglect. If ever this comes to pass the position of the English in India will not long hold out against secret disaffection or open attack. It exists and is maintained because the people of India feel in some dim sort of way that it is to the English dominion that they owe their present exemption from external violence and internal oppression, and that, owing to this exemption, their lives and earnings are more secure than the lives and earnings of their grandfathers were. It may be doubted, however, whether the necessity of obedience to law, a contemptuous toleration of rival religions, and the rudiments of physical science furnish a rule of life sufficiently stringent to curb the baser appetites of men. As regards India and the work of the English in India this view was once excellently put in the *Pall Mall Gazette* itself. Nearly five years ago there appeared in that journal a letter written in a railway carriage on the line between Bombay and Nagpore, and asking the question, What have the English civilians in India to

do with the Mahrattas more than with the buffaloes the Mahrattas tend? The writer refuses to accept the answer that they are there to earn their living, or that they are doing their duty as servants of the QUEEN. This would be considered, he thinks, by the English nation to be a very low standard of duty to take up towards the people of India; nor does it account for the fact that many of these men have of their own free will given up health and life, and ties dearer than either, to make India what it is. Why, he asks, are these explanations unsatisfactory? "Because, for whatever reasons, and with whatever amount of truth, all English life and activity has been pervaded by the notion that 'this present life and visible world are a vestibule to something greater, and are in some way or other under the government and guidance of some one, of whose will and personality ours are a faint reflection.' When once Englishmen cease to believe that the world in which they live 'is ordered and governed by God, whose law, that men shall in a magnanimous way do their duty in that state of life to which He has been pleased to call them, is a real law enforced by a real sanction in a state of things that will actually exist,' they will soon 'renounce every scheme that risks life and comfort, and will by degrees turn a country which will no more be England into that pigstye heaven which will be proved to be the only true one.' There is something more than abstinence from crime and observation of contracts and toleration of religious differences and the elements of physical science here, and if the later edition of the 'English gospel' is to take the place of the older and nobler faith, it is of little use for Englishmen to speculate what its effect in India will be. They at all events will not be there to preach it.

ROMAN CATHOLIC REPLIES TO MR. GLADSTONE.

ONE of the most singular and unexpected fruits of the Public Worship Bill is Mr. Gladstone's attack on the government and policy of the Roman Court. It is an incident which, in the slang of the day, may be said to "rise to the height of an historic event." And it follows by the most direct consequence from that disturbance of the peace of the Church and of the public mind caused by Archbishop Tait's ill-advised policy. The clamour about Ritualism naturally brought Mr. Gladstone back again, from his Homeric studies, to the conflicts of that House of Commons which he had left, as he supposed, to the tameness and dulness of a safe and well-earned repose. What his appearance in Parliament failed to do—that is, to keep the House and the public from going mad on the subject of Ritualism—he attempted in a calmer manner in the *Contemporary Review*. In this he spoke incidentally and somewhat contemptuously of the popular panic about "Romanizing" the English Church and nation, and briefly summed up the reasons, familiar to all Englishmen of whatever party who are not Roman Catholics, why such an attempt must be an idle dream. Perhaps because it was the dullest part of the dull season, his few sentences, strong no doubt, but not stronger than any one might have expected if the matter were touched on at all, roused the fury of the Roman Catholic press. Mr. Gladstone is not a man to be attacked without feeling awakened in himself the sense of the *certaminis gaudia*. He began to write on Ritualism. But the Ultramontanes having been so sensitive and thin-skinned in their resentment at a passing and really commonplace remark, as to threaten his political position, he has with characteristic alacrity accepted the fight which they very needlessly provoked, and has returned their fire by bringing them to book on a very vulnerable point about which, in England at least, all persons had agreed to shut their eyes, except perhaps Mr. Newdegate and Mr. Whalley. No doubt, such a question thrown before the British public is no inconsiderable addition to the subjects of religious controversy in which we are not at all deficient just now; neither party is likely to let the matter drop, and it is one on which passions may rise high. If this proves a fresh element of turmoil, it is to the Archbishop that we owe it. This attack on Rome may possibly be hailed by many persons as an excellent result of the agitation of last Session. We only note it here as being unforeseen, and what would have been thought unlikely; and it is probably the earnest and type of other results equally unlooked for and strange.

In their outbreak of wrath at Mr. Gladstone's few sentences in the *Contemporary Review*, the Roman Catholics have been less than reasonable, and have not shown the sense ordinarily expected in men engaged in the battles of the world. Here is a Church and a hierarchy, to which every other Church and religious body is simply as dirt beneath their feet. For the theory, the creed, the convictions, the moral doctrine, the moral practice, the consistency, of every other communion, Rome has nothing but boundless contempt, and on occasion force vituperation and anathema. In the plenitude of her perfection and possession of truth she has never been nice about calling names, about imputing motives, about saying all manner of evil of all who refused to submit to her

claims. In every non-Roman profession of Christianity, however ancient, however energetic, she proclaims loudly in every possible way that there is nothing but disloyalty to Christ, nothing but palpable and fatal self-contradiction in principles, nothing that deserves the respect of man or that can give hope of the mercy of God. Surely it no more sorts with the ordinary systematic insolence of Roman Catholic warfare than it would with the "ingenuous ferocity" of many Protestant champions, to cry out about a controversial gaze like this. This touchiness, as might have been anticipated, has made the matter serious. In England at least, with all our disputes on hand, religious, scientific, social, we might have gone on for a long time without troubling ourselves, even as much as we ought, about the Vatican Decrees, or their bearing on practical political questions. We were satisfied, and should have continued to be so, with thinking them the height of human audacity and extravagance; so extravagant and audacious that in this land of common sense, no one, Roman Catholic or other, could be supposed to be really affected by them. There has always been in these matters a wide difference between things on paper and things as they are, and our English recognition of this difference is expressed in the common taunt that we are illogical. But this insane burst of puerile temper on the part of the Irish Papist press has had the effect of bringing on them, from one who both from character and intellectual force can give hard blows, a blow which may prove a very hard one, not only in England, where indeed it may be less felt than anywhere else, but on the Roman cause generally in Europe. On the theological, perhaps even on the purely philosophical, ground, Rome can afford to do battle with strong antagonists; but there is one ground which is a dangerously tender and awkward one for her, and that is her relations to the civil power. To have forced on public notice a discussion upon all that the Roman Church has said and claimed as to these relations, with all the illustrative commentary sure to gather round it from the history of her rulers and from the deliberate assertions of her most accredited schools and most authorized representatives, would seem to be the madness of impolicy. And this is what, by their silly resentment of Mr. Gladstone's language, the Roman partisans have risked from a public man who is perilously jealous of the accuracy of his statements.

The energetic disclaimers of Mr. Gladstone's charges, forestalling in their hurry the publication of the pamphlet, show how uncomfortable the issue raised has been felt to be by those interested in it. Monday morning brought to our breakfast-tables two answers, one by the highest in dignity of English Roman Catholic ecclesiastics, the other by one of the most eminent of English Roman Catholic laymen, before the world in general could know anything of the pamphlet, except what some of the newspapers had told us. One may be taken as the official and authoritative reply, the other is a reasoned solution of Mr. Gladstone's dilemma by one who has felt its difficulty, and it is the best that could be done on the spur of the moment by a scholar of ample learning, great candour, and comprehensiveness of thought. Either you are bound to the Vatican Decrees—such is the dilemma—and then you have to show how you can secure that civil allegiance which the Vatican Decrees seem, if words mean anything, to make so precarious; or, if you can still call your allegiance absolutely your own, you cannot be bound to the Vatican Decrees. Archbishop Manning, who is followed by Sir George Bowyer, simply asserts what Mr. Gladstone did not deny, that Roman Catholics are loyal, and that all men must have some conceivable limit to their allegiance to human law. To say that the Vatican Decrees make no difference whatever in the matter is simply to set the Archbishop's assertion against Mr. Gladstone's elaborate argument; and to say that "the civil allegiance of every Christian man in England is limited by conscience and the law of God, and that the civil allegiance of Catholics is limited neither less nor more" is to evade the all-important allegation that what is "more" in the Roman Catholic limitation is the unquestioned and unquestionable supremacy of the will and word of one man, or of those who direct him. Professions of English loyalty, which nobody has questioned, and abuse of Dr. Dollinger, singularly out of place in such a letter as Archbishop Manning's, will not get rid of the Vatican Decrees, which set the judgment without appeal of one single person, and that person a foreigner and the head of an alien system, above conscience, and every interpretation of the law of God but the Pope's. So far as the question is a matter of argument—and happily it has not in England got beyond mere argument—the Archbishop's reply is as lame a one as any opponent could wish. The substance of what Lord Acton calls his "preliminary" answer is that the Vatican Decrees are only one of many foolish and bad things done by Popes; and as regards their bearing on so solid and grave a thing as the allegiance of Englishmen, they are little more than waste paper. The Papal authority is, in fact, committed to things infinitely worse and more dangerous, which, if followed out literally to their consequences, would have made civil government impossible; but as these evil results have not followed, it is clear that, whatever may be "the letter of canons or the spirit of ecclesiastical laws," "it cannot be truly said that Catholics forfeit their moral freedom or place their duty at the mercy of another." This is no doubt a satisfactory practical answer; that it is a satisfactory solution of the question raised in the pamphlet, probably neither Mr. Gladstone nor Archbishop Manning would allow. And it is obviously impossible to treat the deliberate, formal, emphatic reassertion of infallibility, in a great Council of the Church, with all its accompanying documents—Encyclicals, Syllabus, Allocutions—as if it were only on

the same level with the words or the acts of Innocent III., or even Pius V. No one can be expected to class claims which have been revived at this day with so much circumstance and against such earnest and obstinate protests in the Roman Church itself with claims which every one had imagined to be obsolete for centuries. The explanation may no doubt be, as Lord Acton implies, that the Roman system is, after all, as incomplete and incoherent, as full of anomaly and inconsistency, as other systems and all other human things, and that "our Catholic countrymen cannot fairly be called to account for every particle of a system which has never come before them in its integrity, or for opinions whose existence among divines they would be exceedingly reluctant to believe." But it is an explanation which, we suppose, Roman Catholic divines, and those who follow them, would, in the face of events and professions which are notorious to the world, reject with scorn.

There is one person whose views on the subject, however interesting they might be, we could hardly have expected to know so soon. But his own eagerness to speak, and the industry of reporters and Special Correspondents, have put us in possession of them. On Tuesday morning last, if we are to believe the Correspondent and the leading article of the *Daily News*, the Pope expressed his opinion on the pamphlet which had been given to the public in London the previous Monday. If the report is correct, it shows that the Pope is kept well posted up by his friends in England about our domestic concerns. The translation of the Pope's words, transmitted by the telegraph, is not altogether intelligible; but it would appear that he described Mr. Gladstone as so "intoxicated by the proceedings" of Prince Bismarck that he has behaved himself as no one except a person in that unhappy and discreditable condition could think of behaving. He has "suddenly come forward, like a viper, to attack the bark of St. Peter." Mr. Gladstone must indeed be a very odd person, and must have acted in a very odd way, if he has done anything that could by any stretch of fancy be likened to the attack of a viper on a bark. The Pope, as he has "no great desire to read blasphemies," has not, he says, read the book; but Mr. Gladstone, he understands, says that the Pope "wishes Catholic subjects in England to become disloyal to their Sovereign and to the laws of their country." Mr. Gladstone's motive for "interpreting after his own fashion the will of the poor Vicar of Christ" is of course obvious; the "fallen Minister" is "alarmed at the luminous triumph of the Church," and seeks to arrest it. There is nothing very remarkable in all this, except the grotesque juxtaposition, suggestive of nothing but some odd heraldic device, of the viper and the bark. But the conclusion, if it is genuine, is curious. Charlemagne, the Pope says, declared that "even if the Church imposed heavy burdens on the conscience of people," instead of the very light load of dogmas which she requires, "Catholics ought to bear them from their interest in the communion of the Church"; and he proceeds to denounce those who will walk astray as being "not Catholics, and as being worse than infidels and Protestants, because, calling themselves Catholics, they daily rebel against God and the laws of the Church." It is difficult to avoid the surmise that the Pope had been informed by telegraph, not only of the pamphlet, but of the answers to it, and that he is replying, not only to Mr. Gladstone, but to Lord Acton. That the Pope should talk in this fashion is not perhaps to be wondered at; that his friends should allow it all to be published to the world is simply marvellous.

ARCTIC EXPEDITIONS.

IT may be disputed whether patriotism be, on the whole, a good or a bad instinct. There can be no doubt that in one sense of the word, and in certain relations of life, it is an extremely troublesome sentiment. Patriotism, in fact, sometimes means the stupid self-conceit of the ordinary human being multiplied and intensified by sympathy with some millions of his like. The simplicity with which a man who has never travelled beyond his own country, or has travelled beyond it only to quarrel with every unfamiliar arrangement, assumes that his own creeds, customs, and conventions must necessarily be the type of all human excellence, has in it something amazing. We might almost regard it, were not the phrase rather old-fashioned in these days, as a kind of providential arrangement for human happiness. How could we bear our lot so well if we were not lapped in a perfectly illogical self-complacency? But, however convenient, the feeling undoubtedly sanctions some of our worst tendencies. It may imply a mere brutal obstructiveness to all improvement, a conceit which renders us impervious to all criticism, or a morbid desire to massacre a good many thousand human beings because our grandfathers got the worst of it in an attempt to plunder theirs. We need not dwell upon the more familiar fact that patriotism may also stimulate some of the purest of virtues. The force of the passion in all human affairs is likely to be so enormous that it is a matter of vast importance to turn it in the right direction. A nation whose self-respect has been injured is likely enough to turn sulky, and to vent its ill-humour in some direction dangerous at once to itself and to its neighbours. Nothing can be more worthy of a statesman's care than to give to a people the chance of winning distinction in some career which may generate an honourable ambition.

It is tolerably notorious that for some time our pride in our

selves as Englishmen has been in a rather sore and sensitive condition. There are a good many subjects of incomparably higher importance than that of which we are about to speak; still it is true that, amongst other causes of something like humiliation, we have lately been exposed to some annoyance in our capacity of adventurous travellers. Englishmen, since the days of Elizabeth, have been amongst the foremost explorers of every out-of-the-way part of the world. When we were boys our patriotic pride was stimulated by reading the adventures of Captain Cook or Mungo Park, and in later days we have followed Franklin or Livingstone with equal enthusiasm. The qualities which are exhibited in such peaceful heroes are such as we can admire without scruple. Their courage, skill, and delight in adventure for its own sake will have their value so long as masculine vigour is an important ingredient in the human character, and our sympathy is not in this case rendered questionable by the admixture of hostile sentiments towards any other part of our race. When the whole world has been annexed to civilization, when there are excursions every summer to the North Pole, and Timbuctoo is the centre of a network of railways, we may be content to see the breed of travellers die out. But that consummation is not likely to be attained for a generation or two; and meanwhile it represents whatever is most manly without being military. We should be sorry, therefore, if Englishmen could look on with indifference whilst Russians, Germans, Danes, Americans, and Italians are cutting them out in the race of geographical discovery. We can admire without jealousy the performances of the brave young Austrian who was the guest of the Geographical Society on Tuesday last. Fortunately there is a kind of brotherhood amongst travellers, which is not indeed incompatible with the existence of a good many quarrels of truly fraternal intensity, but which facilitates a generous recognition of the merits of foreign rivals. In our college days we generally reckoned amongst our best friends the lads who were our most dangerous rivals on the river or in the schools; and it is with some such mixture of feeling that Englishmen will naturally look upon Lieutenant Payer. He is evidently a man of that type which, as we are accustomed to boast, is most fully represented amongst ourselves. His name has long been familiar to the monomaniacs of Alpine travel as one of the most successful explorers of the Eastern Alps. But we fear that members of the Alpine Club have generally confined their energies to the regions in which a good day's climb may find a speedy reward in a comfortable inn. A few, indeed, have tried to carry their enterprise further. Some during spirits have ventured into the Caucasus, and the conqueror of the Matterhorn has at least broken ground in Greenland. Lieutenant Payer has made a greater use of his Alpine experiences. He has ascended mountains of no inconsiderable height within the limits of the Arctic circle, and has crossed glaciers which are to the glaciers of the Alps what Mont Blanc is to Primrose Hill. Instead of being a hero on the strength of a night passed in a crevasse, he has spent fourteen months drifting upon an ice-floe; and, instead of finding a new route between a couple of neighbouring villages, he has crossed over three degrees of latitude into a region never yet visited by man. It is not surprising that the zeal which has carried him through such exploits should have kindled a corresponding enthusiasm amongst his race. If we were in the habit of *a priori* speculation, we should probably have said that of all places in Europe the least likely starting-point for an Arctic voyage of discovery was Vienna. The Austrian navy, indeed, has shown that it possesses some very good qualities; but the sailors of the Mediterranean are scarcely the people whom one would select for adventures amongst icebergs and white bears. The feat, however, has been performed. The South Germans have fairly placed themselves in the front rank of the Arctic explorers of the present day, and have penetrated to a greater distance than has ever been accomplished before except by one or two English and American expeditions. The most remote country hitherto discovered, unless the land seen by the *Polaris* expedition be an exception, bears an Austrian name; and a tacit challenge has been given to Englishmen which we can but hope that they will take up in the spirit of friendly competition. We wish all success to the new Austrian expedition, which, it is said, is being fitted out to follow the route opened by Payer; but we confess also to a wish that Englishmen may not sit by with their hands folded and see the prize snatched from them for want of their old enterprise.

In fact, there can be no doubt that there is plenty of willingness for the work amongst our sailors and men of science. The very last obstacle which we need take into account in considering the chances of success would be any want of volunteers for the expedition. The Government has only to make known its intention of undertaking such an expedition, and the task will be simply one of selection. It seems to be generally agreed by competent persons that to ensure success the expedition should be sent out by Government; and it is obvious that, to say nothing of the expense, this would give a great advantage in point of completeness and discipline. And yet, in passing, we may notice a fact mentioned by Dr. Petermann. The seven German expeditions which have made explorations in the last few years cost a sum of 20,000*l.*, and of this sum only 750*l.* was contributed by the Government. One gentleman alone contributed about 5,000*l.* Now Englishmen are in the habit of priding themselves upon their liberality and their powers of individual enterprise; they spend every year sums compared to which this is a mere trifle upon sailing yachts about our coasts; and perhaps it is not an impossible hope that they may be piqued by the German example to make an effort

to do something on an equal scale, even if their Government should not be inclined to take the lead. But this possibility, if it is a possibility, does not make it less desirable that the Government should lend an attentive ear to the pleading of the Geographical Society. Dr. Petermann remarks that the Germans have had three great wars upon their hands within the last few years, and as we have only indulged in a few very small, though, for their size, tolerably expensive, wars, he evidently thinks that we ought to have our coffers fuller than theirs, with a view to scientific purposes. Perhaps the argument is not quite conclusive. We do not, it is true, keep up armies on the Continental scale; but nobody can say that we do not spend enough money upon the men whom we employ for the occasional demolition of a savage chief. The view of the last Chancellor of the Exchequer was that we had spent quite as much as we could afford for scientific purposes in sending a single ship round the world. There is evidently room for a curious problem. Is extravagance in one direction a sufficient reason for being stingy in another? Would it be more reasonable to say to a rich man, Since you are spending several thousands a year upon dogs and horses, you ought to be able to spare a five-pound note for a hospital; or to admit that he must limit his charities because his regular expenses absorb the whole of his income? Without solving that question, we may surely assume that the money spent upon an Arctic expedition would not be altogether thrown away even for strictly warlike purposes. Our sailors will be all the better when they feel that they are in every way keeping up the old traditions, and preserving the ancient prestige of the country in every direction. At present, so far as a civilian can understand, the duties of the navy are not of a very exciting description. They have indeed every now and then to go to sea in a large iron pot to try whether or not it will turn upside down in the first storm; but in a general way we should fancy that their lives have to be passed in a tranquillity which would make an occasional spice of danger healthy as well as exhilarating. The moral effect of telling them that they must be kept at home because we really cannot trust them to run risks which are encountered by gentlemen from Vienna can hardly be improving. Even assuming that it would be a good thing if the world at large would consent to know nothing about the North Pole, except that it is probably very cold, the case is practically altered when these inquisitive Germans insist upon taking up the task that we have abandoned. We have the highest possible respect for Lieutenant Payer; and we should like nothing better than to hear that he had arrived at the Pole just in time to see the British flag hoisted upon that hitherto inaccessible spot; but our charity will scarcely take us so far as to wish him the pleasure of taking possession of it in the name of the Emperor of Austria. There seems to be a very fair division of labour established by a kind of tacit consent. The Austrians are about to follow up the route of which they have explored the beginning. The more promising route by Smith's Sound is left to the enterprise of Englishmen. We know that whalers have found no difficulty in penetrating with the help of steam to a region which was once supposed to be only attainable at great cost and risk. Americans have pushed to a remote point with extraordinary ease, and seen no obstacle in the way of further progress. Without arguing the question as to the most promising route, we should certainly be glad to hear that English sailors were to make a fair experiment by pushing a well-appointed expedition up this apparently favourable avenue, and at least to let us know the reason why we can't get to the Pole, if indeed the exploit should turn out to be impracticable.

ESKDALE.

THE completion of the Scotch railway system has in one respect had a singular result. It has quadrupled the market value of rivers and moors. It has invited tourists in thousands instead of hundreds to visit romantic or poetical places within easy reach of the Highland Railway and the Caledonian Canal. But, while it has elevated some hamlets to the rank of villages, it has kept back others, or even reduced them to their primitive condition of the last century. Places once renowned for comfortable inns and much-enduring post-horses have been consigned to oblivion, and districts with an attractive wildness of their own have been doomed to utter neglect. Every one has heard of Hawick, with its excellent manufactures, its free-spoken Liberals, and its quick-footed poachers. But who, in this generation, recollects the situation of Moss Paul, once a stage on the same high road as Hawick, where the Carlisle and Edinburgh coach used to change horses after thirteen miles of stiff travelling over the hills that border on Eskdale and Liddesdale? Now we wish to say something about a district which is rarely visited save by a casual bagman or the travelling partner of a commercial firm, which has neither mineral wealth nor agricultural produce wherewith to tempt railway speculators, which is only twelve hours from London, and which is yet rich in natural beauty, exuberant pasture, and local tradition. It is curious that Scott did not think fit to lay the scene of any one of his novels in Eskdale. In the notes to the *Lay of the Last Minstrel* there is an account of the transaction by which a large tract in this valley became the inheritance of the house of Buccleugh. The combat between the Scotts and the Bontons in the fourth canto, by which one landed man was left, while the rest of the valley was lost and won for a bonny white horse, has aptly enough been

localized as having taken place near a rural police station thirteen miles from Langholm; and to perpetuate the forbearance of the Lord of Branksome, Wood-Kerriek, or Wat Carrick, as it is popularly termed, to this day remains "unannexed." In a part of *Red-gauntlet* the scene lies to the west and south-west of Eskdale; some chapters of *Guy Mannering* take us just to the east. But there is no Eskdale hero of prose, except the Eskdale herdboys. There is direct evidence, in Lockhart's Life, that Scott twice paid a visit to Langholm Lodge, and, on one occasion during his stay there, witnessed a fox chase in the hills, which provided him with materials for the celebrated hunt at Charlie's-Hope, at the close of which a well-baited badger was spared at Bertram's intercession, and christened "the Captain's brock." There is also internal evidence to be picked out of Scott's writings that he must have included bits of Eskdale in those nine annual excursions which in his early days he made into Liddesdale, thereby laying the foundation of his unrivalled and minute knowledge of the Scottish peasantry. There is a Glendearg now on the Upper Esk, and there are Glendimmings in the farmhouses; while an Englishman must be a superficial or contemptuous reader of the great novelist's works who does not catch, in the talk of the natives, idioms and phrases which take him at once to Cuddie Headingg and Jock Jabos, now elbowed out of their places by the Artful Dodger and Mr. Micawber.

The Esk Valley may be roundly stated to be rather more than twenty miles in length. It begins, for our purpose, at Gilnockie, near the confluence of the Liddel, a place renowned for Johnnie Armstrong's Tower; and it ends under Ettrick Pen, which, from an altitude of not quite 2,200 feet, looks down on a wild waste of peaked and rounded summits, and forms the backbone and watershed of this part of the Lowlands. The word Esk, we may remind our readers, is simply the Celtic word for water. Some Latin writers, with an unconscious tautology which we have imitated, have written of an *Iska flumen*; and the national beverage of Scotland is nothing else than this same word with the addition *pè*. Correctly written, whiskey would be *Ushki pè*, "the water of life." The district of Eskdale, divided into its two parishes of Westerkirk and Eskdalemuir, is characterized by a wildness which just stops short of sublimity. Swelling hills, from 900 to 1,500 feet in height, are covered with long grass or dotted with masses of fern. Villages are rare; hamlets few; farms scattered. Here and there are patches of heather, by no means equal to the growth of the Highlands, or even to that of other Lowland counties. Of rocks and boulders and rocky strata, which abound in Ettrick, there are few near the Esk. Tributaries of all sorts, from open drains to brooks, and streams which, being neither rivulets nor yet rivers, are locally called "waters," feed the main artery; half way up the valley, the Black and the White Esk unite their currents in a pool which is the delight of anglers; but nowhere there is any standing water which even by courtesy could be termed a loch. To master the geography of such a country there is one simple way. A tourist may have his choice between Ettrick Pen, Loch Fell, or Windy Fell. These form a barrier which separates the sources of the Esk from those of the Tweed and its tributaries, the Ettrick, the Yarrow, and the Gala. There is perhaps not much to boast of, in a competitive examination of mountains, in 2,200 ft., but higher and grander peaks would fail to display such a splendid panorama as meets the view of one who stands on Pen or Loch Fell and looks south, west, and east. The smoke can be seen rising from factories, and the sun shining fair on Hairibee and Carlisle Wall. To the right of that city lies the Solway and the open sea beyond it; far in the southern horizon rise the peaks of Skiddaw and the quaint formation of Saddleback. In the east can be discerned the blue wavy edge of the Cheviots; due west, the line of the Caledonian Railway, the smoke of Dumfries, and the waters of Lochmaben, famed for a fish called the vendace or vendis, which we believe is not found anywhere else, and which is taken yearly after a contest of skill by the members of a local club. Scott, who was never at fault in any part of the sportsman's craft, introduces the vendace with other fish into a long disputation on ichthyology placed, in *The Abbot*, in the mouth of Roland Greime. The back or northern view is confined, but it suggests a tossing and angry sea, lashed by the tempest, and suddenly turned to solid matter. Of course, too, there is, somewhere in the neighbourhood, a Devil's punch bowl or porridge pot, and a Grey Mare's tail. A good road—Macaulay would have said a road equal to any in Middlesex—leads, not indeed up to Pen or any of its subordinates, but over a lower part of the Pass, and conducts the wayfarer, through a district even more desolate, to Thirlestane and Ettrick, and eventually to St. Mary's Loch.

Civilization advances slowly in these primitive valleys. Eskdale has its mail cart which goes backwards and forwards every working day in the week, but it is only during the last three years that the munificence of the Post Office has vouchsafed the same boon to the neighbouring valley of Ettrick. For fifty years of this present century a cart came out from Selkirk three days in the week, traversed the district, and went back on the alternate days. In other respects the Esk has a like superiority. The pasturage of some of its hill farms is equal, if not superior, to the very best of such tenancies in any part of Scotland. The whole valley—*parce* the Lord of Branksome—is shared by three or four, or perhaps half a dozen, proprietors. The farms are let on leases which often run to fifteen years. In some cases they have been held by the same family for three generations. They comprise 3,000, 4,000, and even 5,000 acres, and pay fully 1,000*l.* a year to the landlord. The rent is wholly realized from sheep and

a few cattle. The wool goes to Langholm or Hawick; the animals to Lockerbie or Carlisle. The extent of arable and meadow land on each farm is infinitesimal, being from 80 to 200 acres, made up of a couple of fields of oats and turnips, a few ridges of potatoes, and some "parks" or meadows devoted to hay. The produce, in one fashion or another, is entirely consumed on the farm. Besides the meadow grass, which is regularly cut and stacked on the premises, a coarse sort of hay is cut and left in ricks on the hill-side. In storms and snow-drifts this is shaken out for the sheep, which have no other food and no protection, night or day, heat or cold, save the lee of a stone dike, the side of a corrie, or the shelter of a few plantations. A good deal has been effected of late years by trenching the moors to carry off the superfluous moisture. And one or two proprietors have added to the value of their estates by planting. But enough has not been done. The abundance of the pasturage may be conceived from the local belief that the very best farms will bear as much as one sheep on every two acres. We are afraid to state the average number of acres which, in a poor and rough Highland district, is considered indispensable for one animal. Barley will not ripen, or is certainly not grown, on the Upper Esk. Wheat would be as much out of place as vines or olives. A capitalist with a powerful will and inexhaustible balances, not looking for more than one or one and a half per cent. on his outlay, might possibly do for Eskdale what the Duke of Sutherland has been doing for parts of his own county. But the return in food-grains or roots would not be very perceptible, and we are quite certain that the farmers themselves do not wish for any such transformation. They lay themselves out to supply the meat, and not the corn, market. We suspect that the only way of expending capital profitably and intelligently would be to drain wet slopes more completely, and to cover more hill-sides with Scotch firs. Every belt of firs is so much earlier pasture in the ungenial spring.

The climate, like that of most counties in the middle or west of Scotland, has an abundant rainfall in spring and autumn, snow and ice in winter, and cold winds in the spring, which chill the lap of May. But the result is written in clear characters on the healthy frames and features of the inhabitants. Epidemics and low fevers have been unknown, save where the sanitary arrangements of the chief town were neglected. The one indigenous malady is consumption, and this insidious disease carries off the weaker children, who are unable to resist Mr. Charles Kingsley's noble east wind. The men and women of sturdier constitutions, as may be seen on numerous tombstones, live on to the age of ninety; and a Government school has had the advantage or disadvantage of being presided over by only two dominies in succession for more than one century. The condition of the Scotch peasantry, it has been elsewhere shown, has recently much improved. Numerous cottages have been rebuilt. Wheat bread has entirely displaced, not only the barley humpock, but that of field peas which no girdle could completely bite, and which no stomach but that of a hind could thoroughly digest. Fuel is to be had for the mere labour of cutting and carting it; and twenty-five or thirty-five cartloads of peats will carry a family right through the year. Thus, in spite of cold, a rainfall which exceeds fifty inches in the year, occasional enforced isolation, and great distances from market or kirk, the Eskdale herdsman or labourer has comforts which might be envied by an artisan at Leeds or by a member of the Union in the Eastern Counties. Such a district is obviously the property of the sportsman as well as of the farmer. Salmon are caught in the lower reaches of the Esk, and white or sea trout run up in considerable numbers to the very foot of the hills. Co-operation has obtained a footing here as elsewhere, and a good deal of the fishing in the Liddel and the Esk and its tributaries has passed into the hands of an Association, which grants, for a consideration, monthly or weekly tickets under fixed rules. No one would look in the Lowlands for the head of grouse which is imperatively sought for on a moor in the Grampians, but black game are to be found in great profusion by the Nith, the Liddel, and the Esk. Large woods are scarce, but a particular grass, which is the favourite food of this bird, covers the hill-sides; and the assertion of Dandie Dinmont that the blackcock were as "thick as doos in a doo'cote" is as applicable to the Esk as it was to his home on the Liddel. As long as the system of large hill farms continues, game which owes nothing to artificial methods will persist in crowding where sheep bleat; and writers who glibly talk about abolishing oppressive game laws, cultivating huge wastes, and establishing Arcadian cottagers each on his rood of ground, have probably disdained to take any account of such trifles as the shortness of a Scotch summer and the cold and moisture of a Scotch hill-side. We fear that parts of the Lowlands are fated long to present much the same aspect which they presented to Agricola and his legions. How black game and grouse can best exist with flocks of sheep and attendant colley dogs is a matter purely to be settled between farmer and proprietor; but we are quite certain that if this cannot be arranged by a little forbearance on one side, and some generous consideration on the other, neither coercive measures nor inflammatory speeches will do any good. At any rate we believe that the immediate and total extinction of the red and the black grouse in these valleys would not enable the farmer to increase his flock by a couple of hoggets or a single ewe in the year.

Readers of Sir John Kaye's Indian biographies will not forget that Malcolm, one of the most eminent of a departed generation of Politicals, was born and bred at Burnfoot, a picturesque spot on the banks of the Esk, where his forefathers are said to have found

shelter after the troubles of 1715. This family contributed no less than three valuable members to the service of the State. The career of the most eminent is commemorated by a pillar which, from a hill high above Langholm, attracts the eye of passengers along the Waverley Route. To another, a distinguished naval officer, his countrymen have erected a statue in the market-place of the same town, "plain for all folk to see." Sir John Kaye dwells with just pride on some festivities which were held on the spot to greet the return of those three youths who had gone out unknown, and had returned as the three Knights of Liddesdale. But another spot, ten miles higher up the valley than Burnfoot, is known as having witnessed, not the birth of administrators or admirals, but the death of a humbler person, whom any one of them might have been proud to claim as a compatriot. We may be allowed to reproduce the incident in the language of Macaulay. The historian is writing of Claverhouse and the persecution of the Covenanters in 1685:—

While this was done in Clydesdale, an act not less horrible was perpetrated in Eskdale. One of the prosecuted Covenanters, overcome by sickness, had found shelter in the house of a respectable widow, and had died there. The corpse was discovered by the Laird of Westerhall. . . . This man pulled down the house of the poor woman, carried away her furniture, and leaving her and her younger children to wander in the fields, dragged her son Andrew, who was still a lad, before Claverhouse, who happened to be marching through that part of the country. Claverhouse was just then strangely lenient. Some thought that he had not been quite himself since the death of the Christian carrier, ten days before. But Westerhall was eager to signalize his loyalty, and extorted a sullen consent. The guns were loaded, and the youth was told to pull his bonnet over his face. He refused, and stood confronting his murderers with the Bible in his hand. "I can look you in the face," he said; "I have done nothing of which I need be ashamed. But how will you look in that day when you shall be judged by what is written in this book?" He fell dead, and was buried on the moor.

There is a local tradition that this ill-fated young man was taken at Waterhead, some four miles off, near the source, not of the Esk, but of the Dryffe, one of the tributaries of the Annan, and that he was brought across the moor to a spot which is just opposite what is now the fourteenth milestone from Langholm. Not twenty years after his murder, in an age of law and toleration, a tomb was built over the remains by the pious care of friends, and texts and uncouth rhymes were added to mark the place, which, like other graves of the Covenanters in the south-west of Scotland, is known, even on maps, as "the martyr's tomb." We subjoin a copy, *verbatim et literatim*, of the inscription, which it is no credulity to think that young John Malcolm may have read in his boyhood, and which must have been cleaned and renovated by the chisel of Old Mortality, who himself is buried in a churchyard not many miles distant:—

The reference in the thirteenth line, as interpreted to us by an intelligent callant, is to the 12th chapter of the Revelations. In the detestation of perjury and prelacy we seem to have a glimpse of Drumclog and Bothwell Brigg, and a whiff of the sermon of Ephraim MacBriar, or perhaps even to catch the tones of David Deans denouncing Erastians and Socinians, and testifying against right-handed defections and left-handed fallings off. There are men still living who remember to have heard the late Dr. Candlish, some thirty years ago, deliver on this very spot, to an unbuzzed and reverent congregation, what we may be quite sure was a forcible and appropriate address. With this we close our notice of the neglected Esk Valley. Though the West-country Whigs were not untruthfully delineated in the History of Macaulay and the novels of Scott as a class distinguished for a rigid adherence to forms, an inflexible obstinacy, a narrowness of vision, and a high spiritual pride, there can be no question that they could exhibit at a crisis some of the most sterling qualities of the Scottish character, and that, when confronted with the rack of the executioner, or, like this dauntless lad Hislop, with the loaded muskets of the Life Guards, they wanted neither the Christian's constancy nor the martyr's heart.

ARCHÆOLOGISTS AT HOME.

THE summer is over and gone, and tourists have resumed their London plumage, and have settled down for another season. The Alps and the Rhine have sent home the travellers that were on them; the tide of invasion has been rolled back from Ireland; the Sassenach no longer infests the Highlands; innkeepers have filled their pockets, and are about to take measures for their annual hibernation. Englishmen have returned from Iceland and Sweden, from the Yosemite Valley and the Falls of Niagara, from "Jerusalem and Madagascar"; Bond Street once more echoes with the tread of boots still ruddy from the old red sandstone or damp with the rains of Killarney; country coachmen impede the traffic of Piccadilly, and rows of City clerks smoke along the roof of the early omnibus. The learned Societies have begun their winter session, the Clubs are full, the Antiquaries have moved into their new quarters, the Institute and the Association have commenced their monthly meetings. Fresh from the vales of Yorkshire and the downs of the West country, they have come back with new experiences, new members, and old controversies and anxieties.

The vacation with its Congresses has not been barren. For though it is a question how many of the archæologists who followed Mr. Sharpe round his full half-dozen of Cistercian abbeys have acquired any very definite ideas about the rule of St. Bernard, there can be no doubt some good work was done in the North. The charming antiquaries who tripped so lightly through the *Domus Conversorum*, and talked so glibly of the refectory and the triforium, have perhaps profited far enough to be able to detail at balls and parties their share in scaling dizzy heights and in descending to darksome vaults; they may still laugh over the dear funny old faces they saw, and the long words they learned to pronounce. They may even have found the pattern for a new polonaise in some recumbent elligy, and boast for years of the *laco* they have copied from an illuminated book or a family portrait. The tender solicitude awakened by the perilous ascent of some footless newel, the polite assistance of a manly arm, the timely display of a shapely ankle, may lead in the far future to consequences the most serious for our brother and sister archæologists. Ruined abbeys lend themselves readily to the requirements of lovers, and Norman keeps are trustworthy witnesses of quiet flirtations. It is true such pastimes can hardly be called archæological; but a time will come, in the course of centuries, when the antiquaries of the future will dig up the records of old lovers and read dry papers on the social usages of the nineteenth century. As yet they hardly illustrate even the poetical aspects of the subject, but such episodes interfere very little with the more serious employments of a day's excursion. They add, for some, to its enjoyment, and it is but once or twice in a long year that amusement and instruction can be so well combined. Much that is misnamed archæology is in reality only the worship of aristocracy under a deceptive form; the toady and his patron meet in pleasant places; and perhaps a hundred people come together that half a dozen may study the arts of the middle ages or dig out the bones of a Roman warrior. If the young people are amused and the old people are not starved, if luncheons are judiciously alternated with "sections," and evening meetings with afternoon tea, nobody not actually misanthropic need grumble extremely. Sometimes, it is true, there is too much of the feast and too little of the fray, too many hospitable receptions and too few papers; but all the members of any society, however limited, are not equally enthusiastic. The after-luncheon speech of one investigator must be set against the long-drawn paper of another; the officers of the army must not march faster than the common soldiers; and the rank and file of an Archæological Institute or an Antiquarian Society must be tempted rather than driven to take an interest in British field-works and prehistoric cromlechs. Archæologists are no worse off in this respect than the promoters of other learned societies, and the objections of grumblers are almost as much to be silenced by the fulness of the money-chest as by the actual amount of work accomplished. Clergymen and statesmen, engineers and naturalists, must all wait for those that lag behind. The past season was particularly suited for enjoyment. The weather favoured the excursions; some good work was done both at Ripon and at Bristol, and neither Society had a right to complain of any want of interest or any lack of subscriptions.

But now that November and the humdrum stage of home life has been reached, it is time to inquire what are the prospects of the coming session. There is something rather disheartening in the sight of a dozen elderly gentlemen and half a dozen ladies sitting in the dim twilight of an autumn afternoon, while the chairman appeals in vain to any gentleman to "make a few remarks," and the frequent yawn goes round; it is melancholy to see the good accord which exists on subjects which formerly always caused a discussion, and to know that nothing will disturb the peaceful calm that breathes around, that no heterodoxy on Saxon architecture or Roman inscriptions can rouse a fierce tumultuous passion in the antiquarian bosom; that a controversy has no charms for the degenerate archæologist of the present; that upon the fields where twenty years ago and less such stirring conflicts took place the millennium seems to have dawned; the lion lies down with the lamb, and Mr. Parker slumbers peacefully beside Mr. Freeman.

It is a long time since any contest, however moderate, disturbed the peace of either the Archæological Institute or the Associa-

tion. But it is in controversy that the truth can best be ascertained. The shock of contending intellects strikes out sparks of electrical light. Unfortunately our greatest archaeologists have become too wise. There cannot be any longer the slightest cause to call in question a decision of Mr. Clark on military architecture, or of Mr. Fortnum on dactylology, or of Mr. Morgan on horology. They are always right, and no one in his senses will think of differing with them. Sectarian questions are rightly avoided, though one of the last disputes of any vigour was conducted four years ago as to a point of mediæval ritual. The harmony that prevails amounts to monotony. The managers of both Societies have so carefully steered past rocks of offence that few causes of quarrel exist and none can be called up. If they have not exactly made a wilderness and called it peace, they have at least, in the thirty years or more of each Society's existence, settled so many abstruse questions that it seems almost as if nothing were left to be conquered. If this could for a moment be accepted as the truth, the reason for their existence would appear to have ceased. If there is nothing left for archaeologists to argue about, why should they be at the trouble of meeting? But no one acquainted with the facts of the case can accept this conclusion for a moment. Some of the best informed antiquaries will support a theory that archaeology is only in its infancy, and that the thirty years of labour have only cleared the way for serious and productive work. Nor have we the slightest intention of complaining that disputes are avoided. To carry on the business of a great debating society—which after all the Institute is, and the Association also—is not a very easy task, and the cultivation of amity is a very desirable object. Besides, it is hardly to be expected that the older members are to trail a figurative coat-tail through every meeting, or that a learned man can make a feint of ignorance in order to draw out other learned men's opinions. This would be carrying the argument a little too far. But something might be done to encourage controversy, and, without any evil intent, to stir up strife. The younger members of an antiquarian body should be enticed to take part in the proceedings. The papers to be read should, if possible, contain queries, and a discussion on every paper should be organized beforehand, the speakers' names be before the chairman, and, as far as it may be practicable, some division of opinion indicated. A new life would thus be given to the monthly meetings, a greater interest to the audience, and a stronger attraction to the enterprising and the active-minded. The meetings of the Architectural Institute are lively enough. There is no want of warmth in their debates. Perhaps sometimes a little of it might with advantage be spared to the archaeologists. Both Societies might profit by the interchange.

One scheme has been of late put forward in a private and hesitating manner. No attempt has been made to give it shape. But there has been a whisper heard that the hour has arrived when the differences of a quarter of a century should cease, and the sheep which still wander from the fold should return. The questions which divided men's minds twenty-five years ago have long been sent to rest. The lapse of years has tamed many a fiery spirit. Many a warm heart has ceased to beat. A reunion would be pleasant to those who remember the great days of old. It could not be distasteful to the young. And it would have the double advantage of promoting peace and ensuring controversy. The entrance of new blood would quicken the circulation; and while at present differences of opinion are unnoticed, and often unknown, they would then be brought into prominence, and the heat of debate once more warm the cold air of the monthly meetings. Could the rival Societies meet next year at Canterbury, where they met together before a divorced existence of so many years, a lasting union might perhaps be effected, and new vigour be given to the archaeological constitution. There are great difficulties in the way of any such arrangement. Some of them may appear, some of them may actually be, insuperable. But the subject is one well worth considering, and we trust the signs are not deceptive that it will be considered.

But, as we have already said, what is chiefly wanted by both Societies is a fresh supply of energy and life. The annual meetings, in which local and particular influences work, are almost uniformly successful. There is seldom any want of warmth or any dulness in the country congresses. Exeter and Sheffield, Ripon and Bristol, were stirred to the core at the prospect of the visit with which each of these cities was awakened up in the course of the past two years. But at the home assemblies during the winter and spring there is always a need of some stimulating power. There is always a sameness, a sleepiness, a harmony foreign to anything like enthusiastic work. No strong views are expressed, no startling theories are published. An outsider might imagine that no one present had any real interest in the proceedings; the attendance dwindles to forty or fifty at most where hundreds ought to come; and even a good stand-up fight will hardly suffice to arouse the members to any keen sense of the situation. One cannot help wishing for a little more manifestation of even erroneous opinion, a little more obstinacy and a little less authority. The spirit that ostracized Aristides, the opposition which excites to emulation, are needed to urge on the modest and the diffident. There is no lack of industry. The journals give ample evidence of inquiry, and of accurate investigation. But of controversy there is none, and the meetings are wholly devoid of debate. A country squire asked one of his farmers how he liked the new parson's sermons. "They be too mild," was the reply; "they do want a

little more of Sattan to be put into they"; and something of the same kind may be said with truth of the archaeological meetings of the present day.

AOSTA.

THE cities named after the first Augustus rival in their number those named after the Macedonian Alexander. Some indeed of the many cities which bore the name of Augusta were actually named in the time and in the honour of later Emperors: still it is the title and tradition of him who was Augustus before and above all others which is in a manner carried on even in those later Augustæ of which he was not the immediate founder. But from most of the cities which bore the Imperial title that title has utterly vanished, or has survived in a strange and corrupted form. It needs some effort to believe that there was, as Ammianus bears witness, a time when the name of London was remembered only as the former name of the Augusta on the Thames. In Augsburg we can still see the traces of the Imperial title; but it is only the Italian tongue which still allows its full measure of syllables to Augusta Vindelicorum. In Augustodunum the title itself was but an element in the name, and it has left traces, though but feeble traces, in the name of Autun. It is yet less obvious at first sight that two Imperial titles lie hidden in the name of one of the most renowned of Spanish cities, and that Zaragoza in all its spellings is only a corruption of Cæsar-Augusta. But some of the Augustæ have not kept even such signs of their origin as this. From Augusta Taminorum and the more renowned Augusta Treverorum all traces of the name have vanished; indeed Augusta must have been from the beginning little more than an official name of the city of the Treveri. But there is another Augusta, perhaps of less renown in history, certainly of less account in the present state of things, to which the Imperial name still cleaves with only a slight phonetic change. Deep in its Alpine valley, by the side of its rushing rivers, still girded by its Roman walls, still entered by its Roman gates, the fortress by which the first Augustus sought to secure Rome and Italy from the untameable barbarians of its north-western corner still stands, and, as it has a right to do, still keeps its Imperial title. Augusta Prætoria, Augusta Salassorum, has handsly changed its name by passing into Aosta, birthplace of Anselm.

The Salasian, like the Treveran, Augusta has a mythical founder, at whose bidding the city arose at an age long before Romulus had scarped down the sides of the Palatine hill. But the legend which sprang up by the Dora is less well conceived than the legend which sprang up by the Mosel. There is something bold, at any rate, in the notion of Trier being founded by Trebetas the son of Nimus; but we do not exactly see why an unknown Cordelus should have founded an unknown Cordelia on or near the site of Aosta. The only question which such a story awakens is whether the name comes anyhow from the same mint, whatever that mint may be, as the famous daughter of Lear. But, leaving fables of this kind, the true history of the valley of Aosta is one of those pieces of history of out-of-the-way parts of the world which sometimes show how a lasting historical character may cleave to a particular district through all ages. One of the first things which catch the eye of the traveller is the fact that in Aosta and the coasts thereof things are no longer written up in Italian, but in French. French, in short, is the received tongue of the district. No doubt, if one came to examine the real speech of the people, it would prove to be, not French but Provençal, not the tongue of *oil*, but the tongue of *oc*; but at any rate it is not the tongue of *si*. French is the speech of literature and society at Aosta, so far as literature and society can be said to exist there. And literature is at least represented by a little history of the district, written in the French tongue in 1839 by M. Orsières, a canon of the church of Aosta, which was all the help that was lately to be found there by the historical inquirer, and of which we may say that the feeblest help is better than no help at all. There is said to be a newer and larger book, but it is also said to be out of print, a fact which at least speaks well for the spirit of reading in the valley. Now this use of French—at least of *Gal-Welsh*, as distinguished from *Rum*—in the city and vale of Aosta is no mere accident, but the very essence of Aostan history. The district is, and always has been, a piece of Gaul on the Italian side of the Alps. That it was so in the days of Augustus is the cause that the vale was ever honoured by the presence of an Augusta. After Cisalpine Gaul was held to have become Italy, after Transalpine Gaul had become a province of Rome, the unconquerable inhabitants of this Alpine corner still maintained a practical independence. The Salassi had, like other people, received defeats from the Roman arms; but they had also inflicted defeats in their turn, and their final conquest was looked on as one of the most memorable events of the reign of the second Cæsar. The tribe was held to have been utterly rooted out by the arms of his general Varro; those who escaped the sword were sold as slaves; the land was parted out among Roman soldiers, and the camp of Varro grew into the city of Augusta Prætoria, Augusta Salassorum. Still, though its old defenders were swept away, the land did not lose its character as an outpost of Gaul within the bounds of Italy. When lands were shifting to and fro at the time of the Wandering of the Nations, and again when they were doing the like after the break-up of the Carolingian Empire, the vale of Aosta often changed masters, but it always showed a tendency to attach itself

to the master of Burgundy rather than to the master of Italy. It formed a part of several of the many Burgundian kingdoms, and, whenever it was separated for a while, it seems always to have found its way back to the Burgundian connexion. It belongs in fact to the same group of lands as Maurienne, Vaud, Bresse, the Lower Wallis, and the other dominions of the House of Savoy. Under the rulers of that house Aosta was raised to the rank of an Imperial Duchy, and it still gives the ducal title to one of its princes. Since the first rise of the Savoyard power in the eleventh century, Aosta has always been a cherished possession of the dynasty, and it still remains the last fragment of their great Burgundian dominion on both sides of the Alps, on both sides of the Lemnan Lake. Perhaps it was only ignorance of its peculiar history which saved the vale of Aosta from the fate of Savoy and Nizza.

We thus see why a tongue which is roughly called French is the tongue of the vale of Aosta. The land is one whose allegiance was due, not to the crown of Monza, but to the crown of Arles. Augusta Salassorum came within the archchancellorship of the Primate of Augusta Treverorum. And what is true of language is equally true of architecture. There is not a trace of Italian work in the buildings of Aosta, save only the towers with open arcades at the top which are seen in some of the greater houses. Otherwise every feature is Burgundian. The doors and windows of houses and churches are such as are nowhere seen in Italy, but such as may be found anywhere from Dijon to Constanze. Indeed to an eye long accustomed to Italian forms it is a relief to see real mullions and mouldings. The traveller who knows not, or who has forgotten, the special history of the district says at once, This is Burgundy and not Italy. And he finds that the witness of history and language only confirms the witness which he draws at first sight from the buildings of the unsavoury suburb which lies between the arch of Augustus and the Prætorian gate.

At Aosta it is the Roman remains which have the first claim on our attention. Their extent and the importance of some of them are wonderful. The Prætorian Gate of Aosta cannot compare—it never can have compared—with the Black Gate of Trier; but its wide arches, with a smaller one on each side, are still grand in their half-ruined state, and the remains of the marble casing and ornaments show that it was a work rich in detail as well as stately in composition. But at Aosta, before we reach the gate, we pass under the triumphal arch of the founder, reminding one somewhat of Rimini, though at Rimini there are real columns, while at Aosta there are only half-columns clinging to the wall, and, oddly enough, these Corinthian half-columns support Doric triglyphs. There is no reason in the eternal fitness of things why they should not, and there is nothing at all displeasing to the eye in the arrangement; but we fancy that the sight would put a classical architect into the same state of mind as a herald who should see colour put upon colour. The street between the arch and the gate partly bears the name of St. Anselm, and partly the evidently ancient name of *La Cité*. But why is the city outside the gate? The cathedral church too is within the Roman walls, though the collegiate church of St. Ursè stands without them. The walls themselves, enclosing, as usual, a square space, are, as regards their extent, wonderfully perfect, and they have had the great good luck to keep several of the square Roman towers nearly untouched, though some of them have been seized on by mediæval builders, and turned into fortresses of their own pattern. But the walls have suffered greatly in another way through the very excellence of their workmanship. Brick, such as we see at Rome and at Trier, is unknown in the Roman buildings of Aosta; and especially that form of Roman masonry to which we are most accustomed in Britain, the alternate courses of brick and stone at York and Lincoln and Anderida, was not known till long after what at Aosta is doubly the Augustan age. The walls of Aosta were cased throughout with squared stones, and, as always happens, these have for the most part been picked away. Beside the arch, the gate, the walls, and their towers, there is also a fine Roman fragment, which the modern Augustans stoutly maintain to be an amphitheatre; but, seeing that the wall is straight and that it is within the Roman city, those who know what an amphitheatre was must pronounce it to be the straight side of a theatre. There are also some vaults under one of the canons' gardens, and out of the town, beyond the arch, is a Roman bridge of a single arch of massive stones. Altogether the city of the Salassi is, as far as the remains of Imperial days go, no unworthy rival to the city of the Trovers. Aosta has no one object of such surpassing grandeur; the arch of Augustus cannot dare to match itself with *Porta Nigra*; but, as a whole, as an example of the fortification of a Roman town, it is far better preserved than Trier.

The mediæval antiquities of Aosta consist chiefly of the churches and their contents. We have said that the domestic work is of strictly Burgundian character; but there is nothing that can be called street architecture. And the military works of mediæval times consist only of the few round towers added to the Roman walls, picturesque, but nothing more. The churches are chiefly remarkable for their towers of the Primitive Romanesque pattern, a pattern which is Italian in the sense in which all Primitive Romanesque is Italian, but which is not more Italian at Aosta than it is at Cambridge, at St. Aventin, or at St. Maurice. It is said that in the tenth century the effects of war and pestilence had made Aosta almost forsaken, and that the city began to revive early in the eleventh. One can have little doubt in assigning to this date the twin towers of the cathedral church of Aosta, the minister of St. Gratian and St. Jocundus. They must

have been new when Anselm was born beneath their shadow. The northern tower is untouched, a magnificent example of the stern grandeur of this early style, which in England we see only in smaller and ruder examples. Of the southern tower the upper part must have been rebuilt at the end of the twelfth or beginning of the thirteenth century, but with a certain adaptation to the earlier work, the midwall shaft being still used. The towers flank the apse, but so great is the width of the church between them that they hardly seem to belong to the same building. The church itself is plain and much disfigured, but its massive square piers are most likely original. On its north side is an apsidal chapel of the fourteenth century which would look quite in place either in Germany or in England, and a cloister, bearing date 1636, of debased style certainly, but which might well have passed for a century older. The choir has a splendid mosaic pavement of about the fourteenth century and a noble set of stalls; below it is a Romanesque crypt in which classical capitals have been used up again. The treasury has also shrines and vestments to show and a consular diptych of the time of Honorius. The other great church of St. Ursè beyond the walls has a detached tower of the same class as those of St. Gratian, but at once plainer and more artistically designed, probably a little later in date. The smaller churches of the city, not remarkable for much else, supply several towers of the same general type. But St. Ursè has also, like the cathedral, a fine set of stalls, and it has moreover a Romanesque cloister of singular beauty and curiosity. The whole history of Jacob and Esau, with other Scriptural and legendary scenes, is carved on the capitals. The sculpture is of course rude, but it is not lacking in spirit, and the artist's attempts to represent camels are curious enough.

We need hardly say that the mountain views in the valley of Aosta, the valley of the rushing Dora and of its no less fast rushing tributary the Buthier, are glorious beyond words. And the city itself, with its towers—their low spires showing in the distance—is no contemptible addition to the general landscape. And we may stop to think how that valley, which nature might seem to have made so inaccessible, has been in all ages a high way of armies. We will not take on ourselves to settle where Hannibal did cross the Alps; it is the fixed belief of Aosta that he passed by the place where Aosta was to be. It is more certain that a crowd of later warriors, down to the elder Buonapartes, have marched along the same track. His career might have been ended hard by Aosta, had an Austrian officer, whose prisoner he was for a moment, only been a little quicker. The remembrance of so famous a visitor is preserved in the name of the *Rue du Premier Consul*, which name no one at Aosta has been silly enough to change into anything else. And, while we think of conquerors, we may think also of holier names, of Bernard of Menthon, of our own Anselm. When we have seen his birthplace, we better understand the statement of his biographer, at first so puzzling, that to him, a stranger in Italy, the heat of that land was oppressive. The only drawback to Aosta is the filth of the place and the wretched look of the dwarfed, diseased, and cretinized inhabitants—strange descendants whether of Salassi, Prætorians, or Burgundians. But fresh air and more of real comfort than in many grander places may be had at the little *Hôtel du Mont Blanc* just outside the town. Nine hours and more of diligence from Ivrea—a distance which an English coach would have done in four—is really no heavy price for a visit to such a place.

HERRING-FISHING.

EIGHT hundred millions of herrings are a handsome return for a single season's fishing, and account for the very thriving condition of some rising fishing places on the north-eastern coast of Scotland. According to the writer of the report in the *Times*, this is likely to be the total of the take, and we may perhaps trust his present estimates on the strength of his former accurate calculations. To a great many frugal and industrious Scotchmen the herring fishing is the great business of the year, though it only lasts through the spring and summer. Nor is it only the seafaring population strictly so called that make their profit by it. No doubt it is the natives of the fishing villages and seaboard towns who provide the boats and chiefly man the herring fleets; but they are largely reinforced by volunteers from the inland districts who never come within sight of the ocean for the greater part of the year. Towards the middle of the spring, when the herring shoals may be supposed to be setting in towards our shores, many a Highlander is making ready for a start from his shieling in the mountains. Should you chance to be in the Highlands then, which of course is highly improbable, you may see the weather-beaten mountaineers tramping towards the coast by pairs or in knots, looking by no means nautical and scarcely even amphibious. They wear thick tweed shooting-coats instead of pea-jackets of shaggy pilot cloth, and if they carry sou'-westers by way of headgear, their limbs often terminate in shooting-gaiters. They go on in faith and good heart, and with pretty solid reason, for, if they have not arranged for a positive engagement, they have old standing connexions at the port they are bound for. They look enough of landmen to make it likely that they will have to chance sea-sickness among the other hardships that await them on the deep; but for that the mountain-dew is understood to be a marvellous specific, and they are well insured to stormy weather, and have had sufficient experience in

the way of exposure to the elements. They will be returning homeward by the same road a little before the time when sportsmen betake themselves to their shooting-boxes. Then they will shake down into the places for which their birth and education have apparently fitted them. They will swell those forces of watchers on the moors which have been put upon a peace footing during the close season; and they will be willing enough to impart their maritime experiences when trudging behind you with the game-bag or carrying your spare rifle.

As for the fishing places themselves, towards the beginning or middle of May they are all in a bustle. Boats that have been laid up high and dry through the winter months are being dragged down towards the water-mark for the spring overhauling. Seams are paid, spars spliced and looked to, hulls touched up with tar and paint, very much less for show than service. The ropes are closely inspected, for on their soundness and strength may depend the landing some miraculous haul of fishes, or the safety of the valuable fishing gear in the event of rough weather. As for the tarred nets, the whole beach is covered with them far and wide, as well as all the slopes of the "bents" or low sand hills. Herrings are in every one's mouth—metaphorically, for necessarily there is a deal of speculation in the business. Though the arrival of the shoals may be looked for pretty confidently, the fish are capricious at the best of times, and may for no particular reason desert the places that are generally favourites with them. They may swim high or low in the water, and the weather may be rough and unpropitious, as it was off a few of the stations this year. Then herrings in one respect are like hops or grapes. A very abundant harvest by no means implies as a matter of course proportionate profits. The market may be overstocked, especially if some of the most remunerative outlets are stopped. Most of the cured herrings go to the North German and Baltic ports, to be consumed by German peasants and emancipated Russian serfs. This year half a million of barrels are said to have been shipped for those destinations already, and during the Franco-German war the partial French blockade laid pretty nearly an embargo on the German consignments. In any case, when you have caught your fish you have to dispose of them by contract to the curer. The wholesale prices depend on competition or combination among the dealers, and on a variety of circumstances beyond the fisherman's control. So that speculation is kept up through the whole of the season, and from the first day to the last a canny population may be fluctuating between the extremes of hope and despondency.

Few sights are more animated than those to be witnessed in a fishing town when the advent of the season's shoals is expected or announced. We may imagine ourselves transported to Fraserburgh or Peterhead, for Aberdeenshire is now the great headquarters of the Scotch herring fishery. The borough of Fraserburgh may be said to have been made by it, while Peterhead has been committed to it more and more since whaling and sealing have been done chiefly from Dundee. The *Times* tells us that forty miles of seaboard in Aberdeenshire send out no fewer than one thousand nine hundred boats, of which over eight hundred hail from Fraserburgh alone. These boats are, we believe, owned for the most part by fishing families of comparatively small means, and the crews are paid in the main according to the results they obtain. Generally the fleet puts to sea of an afternoon. The narrow, rough-paved streets that lead to the quays and piers are crowded with groups of men and lads all heading in the same direction. All of them carry boxes containing their provisions for the cruise; the nets and boat stores have of course been put on board before. It need not be said that all the women of the place are out and vociferous. Boat after boat takes its hands on board and gets under way. The best man of the partnership is told off for the command, and places himself at the tiller, though very possibly he may have the smallest share in the venture. As many hundreds may be going to sea, and the start is pretty nearly simultaneous, it may be conceived that there is a deal of inevitable confusion. On the whole the men are very good-humoured, and most of them may be presumed to be pious, yet there is plenty of strong language, to say the least of it, as the craft go swaying about and crashing against each other. One by one they are towed out from the outer or inner harbours to the pier-heads, the women and girls, the hobbledelays, and harbour lingers-on generally contributing their strength to the different tow-ropes in a motley partnership. Once clear of the piers, out go the sweeps, or the sails are hoisted, according to the set of the wind and the state of the weather; and a very pretty sight it is of a bright summer afternoon to see the brown sails glancing between the blue sea and sky, as the boats are bobbing and dancing on their tacks towards the distant horizon. This jovial start of a fine afternoon is the bright side of the herring-fishers' life. Though we may follow them in fancy, we should be sorry to be with them in the flesh through the long, slow watches of chilly nights, or the more cheerless hours of raw and foggy mornings. Good fortune will reconcile them to a great deal, but occasionally they must draw the waters again and again blank, or nearly so; or, more trying still to envious human nature, their comrades may be hauling in the herrings hand over hand, while they can only show a beggarly account of empty bottoms. The fishing, too, is carried on off one of the most perilous coasts in the world. The North Sea is particularly stormy, and Eastern Scotland is famous, or infamous, for the want of safe harbours of refuge. With a violent gale blowing on to land, there is no safety on those granite-bound coasts, and the stretches of low sand, with the shifting currents that run round them like mill-races,

are to the full as treacherous. When a gale blows up suddenly there is nothing for it but literally to "cut and run"; the ropes that secure the nets are severed, and the frail boat may have to leave behind the lights of the town it belongs to, and run for the doubtful shelter of some distant frith. In wild weather families are left for days in anguish and suspense, listening to the sinister howling of the storm, and only certain that some time must elapse before they can learn the best or the worst. There have been sudden and violent gales in recent seasons after which scores of boats have been reported missing, and as the crews are sometimes made up by families, a single wreck may desolate a household. Even in this year, profitable as it promises to be, there have been an unusual number of casualties, although happily there has been no sweeping destruction.

When the fleet comes back with its silvery prizes the sconce in the fishing town are to the full as animated as at the start. Then is the time for the women to bestir themselves, and every able-bodied woman in the place is out and about and earning wages when the men are in their houses enjoying repose. The fish that have been caught are turned over to the curers. Strings of bare-legged ladies go struggling along under weighty baskets. The broad open spaces on the quays are railed off into temporary yards, where the herrings are being split and cleaned and stowed away in the barrels between layers of salt. It needs all the freshness of the breezes from the sea to temper the characteristic fragrance of the local industry. The place and its purlieus all smell fishy and briny. You pick your steps between topping piles of barrels, with the brown brine oozing through the seams and draining into the interstices among the paving-stones. If brine is as bracing in its properties as is believed, one can understand how the women show so vigorous in their bony *physique*, for they and their garments are steeped and saturated in salt. When such masses of herrings are in course of curing, it may be understood that there must be quantities of garbage. You see the troops of "lean dogs gorging themselves over their carnival," and the gluttonous seagulls swarming and screaming over the harbour have naturally a very joyous time of it. But, in spite of all that these volunteer scavengers can do, there is a great surplus of unsavoury refuse that seems to flow on into the town, choking the gutters and impregnating the air to the uttermost back streets. Healthy the people are, it may be presumed; the very children grow wonderfully ruddy on a liberal fish diet and in their fishy atmosphere. But assuredly these lively fishing boroughs smell anything but agreeable to the inquisitive stranger who has been tempted to visit them in the curing season. It will be seen that the life of the herring-fisher is one of hardship, and the risks he must face are very serious. But then there is no calling without its drawbacks. On the whole, the men thrive and enjoy their existence, and if the sea does take toll of them occasionally, still the aggregate of mortality is much lower than in many other comparatively safe trades, such as that of the mason. The herring-fishing keeps flourishing populations in comfort, besides making the difference between ease and penury to many a struggling family in the Highlands who would otherwise find it difficult to make the two ends meet. Moreover, it is an excellent nursery for bold seamen, so that there is good reason for the country to congratulate itself that it seems to be in such a thriving way.

AUSTRALIAN MEAT.

IT is many years since a protest was raised against the exclusive devotion of the newspapers to the balls and banquets of wealthy and fashionable life:—

Rise, honest Muse, to Hackney roam,
And sing of Mrs. Dobbs at home.

In the spirit of an equality and fraternity more frequently preached than practised, we invite readers to turn for a moment from the banquet at Guildhall and attend to what we have to say about a "repast" of Australian meat at the Lambeth Baths in Westminster Bridge Road. Mr. Tallerman, the enterprising importer of what he calls "these meats," has organized a series of meetings and eatings at which selected guests are invited at once to refresh their bodies and enlarge their minds by dining on Australian beef and mutton, and hearing Mr. Tallerman and others discourse upon the economical advantages of that proceeding. It may perhaps occur to the critical observer that the proverb, "Good wine needs no bush," has gone out of date, and we should be disposed, without special reference to Australian products, to think it has. Some merit and a good deal of advertising, direct or indirect, seem to be the conditions of success in modern life. We do not therefore consider that any presumption against Australian meat is furnished by the fact that much effort is needed to induce people to consume it. There is indeed a preliminary difficulty something like that which occurred to the celebrated Mrs. Glasse. An ordinary family, with a tin of Australian meat before them, would be almost as hopeless of food as if they had a barrel of oysters and neither knives nor skill to use them. They might indeed breach the case with a poker and dig out the contents with a spoon, but the meat thus treated would certainly not be nice to look at. The top ought properly to be removed with an instrument made on purpose, and usually kept in the shops where the meat is sold; and then, if a small hole is punched in the bottom, and the tin turned upside down on a dish, the contents may, by blowing through the hole, be easily discharged without impairing

the cylindrical shape given by the tin. If the meat is to be eaten cold, the first-condition of making it acceptable is to turn it out neatly and carve it properly. As to ways of warming the meat no experience was afforded by this "repast," because the meat was all served cold exactly as it emerged from the tins. We may venture to say, however, that this is the great difficulty of Mr. Tallerman's case. He describes a method of warming the meat with vegetables, by which wholesome and nutritious food may be produced. He can hardly be wrong in saying that the fat and jelly found in the tin represent the virtue which has been extracted from the meat, and it would seem to follow that this virtue may be transferred to the vegetables. But the meat is already so much cooked that any attempt to cook it more is apt to reduce it to a stringy substance which is not very nice nor likely to be particularly nourishing. It may be that the prejudices of Englishmen in favour of solid meat not overdressed will yield to education. But at present this prejudice exists, and in the class of servants is almost unconquerable. If a housemaid had a pain in her little finger a week after dining on Australian meat, she would lay the blame on Mr. Tallerman. The importers may, however, fairly say that they do not address themselves primarily to the class that can or will provide itself with ordinary butcher's meat, but to the numerous classes that cannot. Cobbett was never weary of expatiating on the misery of a people that existed on potatoes, and we cannot doubt that he would have considered it a great alleviation of this misery to stew one pound of Australian meat with four pounds of potatoes, as recommended by Mr. Tallerman. The English agricultural labourer is rather better off now, but twenty years ago he got very little meat of any kind, and what he did get was usually bacon, and it must surely be an advantage to substitute fresh meat sometimes for salted. We must not, however, make the mistake of comparing the Australian meat at 8d. per lb., with beef and mutton of the highest butcher's price. There are usually in large towns shops where meat can be bought at a lower price. But the advantage of the tinned meat is that it may be kept at any grocer's shop, whereas a cheap butcher, if he exists at all, may be two or three miles from the consumer. There is also the sea-going population, which on long voyages has hitherto necessarily subsisted on salt meat, and to them it can be hardly doubted that the tinned meat affords a pleasant and healthful change of diet.

It may not be irrelevant to the subject of food supply to mention that, at the last Quarter Sessions for a county adjoining London, an applicant for a licence for slaughtering horses was asked by a magistrate what he did with the carcasses, and he answered that they were made into sausages. The consumption of sausages in London must be enormous, and they are doubtless favoured by the working-class because they can be readily cooked. In this respect they compare advantageously with Australian meat; but, on the other hand, it may not be unimportant to observe that they are largely horsey, whereas the Australian meat is undeniable beef and mutton of good quality. On this last point prejudice exists which the "dinners and exhibitions" got up by Mr. Tallerman ought to dissipate. Everybody cannot be expected to applaud a dinner or supper chiefly composed of cold beef or mutton, bread, and tea, and it may be suspected that the guests at Mr. Tallerman's upper table did not enjoy their next day's dinner the less because it included hot meat, perhaps game, beer, and wine. But they delivered general and emphatic testimony to the good quality of the provisions placed before them, and it may be added that there is every probability that the quality would be good. As regards the "mutton hams honey-cured," the prevailing opinion seemed to be that English taste required to be further educated to appreciate them. The statement of Mr. Tallerman's bill of fare that these hams are "a delicious breakfast relish" is not perhaps inconsistent with the fact that they appeared to many persons decidedly disagreeable at dinner; but we are inclined to attribute to enthusiasm his assertion that they are "equal to prime small York hams." It might be fairly urged by Mr. Tallerman that a first tasting is no trial. Germany can produce several dishes for which the English taste requires education, and it might be remarked that probably nobody ever liked his first cigar. But, putting the mutton hams aside, there were six preparations of beef and mutton of which approval was general and decided. There was perhaps some little difficulty in making out which was beef and which was mutton, and probably a cold boiled neck of English mutton would convey a tolerably correct idea of the whole "repast." It may be admitted that cold mutton, although wholesome and nutritious, is not provocative of enthusiasm. Indeed Cobbett, so far as we are aware, is the only writer who has had the manliness to confess a liking for it. Speakers at these "repasts," imitating Mr. Disraeli at the Mansion House and other practised orators, prefer sound to sense, and they find that a little tall talk about "the reciprocity which brings the superfluous plenty of Australia to the scarcity of England" is received as an agreeable change after Mr. Tallerman's practical directions for the serving of "these meats." But, after all, it is a cold-mutton question, and the attempt of a speaker to compare it with the Corn-law question was ludicrously inappropriate. We never heard that Mr. Cobden or Mr. Bright had any difficulty in persuading working-men to eat bread made of foreign wheat, whereas undoubtedly strong prejudice exists both in the lower and middle classes against Australian meat; and it is right to say that, as regards quality, that prejudice is unfounded. In the early days of the "movement," as the newspapers call it, much inferior meat

was sold as Australian, which the colonists assert was grown in England. But now the genuine article may be bought at almost every grocer's shop, and as the breed of cattle is good and the pasture is good, the meat cannot well help being of uniformly good quality. The best safeguard against adulteration of any kind is that it does not pay, and one cannot easily conjecture what the Australians could send instead of the beef and mutton which feed upon their plains. It is, however, possible to have too much of a good thing, and most persons would be satisfied with eating beef without desiring to drink it at the same "repast." Tastes, however, are so various that perhaps the plan of handing round beef-tea in jugs and pouring it into cups may have admirers. The bulk of the company certainly preferred ordinary tea, which is so largely consumed in Australia as to have a certain harmony with the special character of the "repast." There was also a considerable supply of Australian jams, made from apricot, peach, and quince, but we are not aware that in this article Australia claims any great superiority over Europe and America. We believe that she does stand before South America in the quality of her pasture, and if a method could be invented of preserving beef and mutton without cooking it quite so much, her graziers would make incalculable fortunes.

A speaker at this week's "repast" distinguished the upper and middle classes from his own working class by the circumstance that the former have always "something in the house," whereas the working-man sends to a shop for the material of every meal. This speaker seemed to expect that by the use of tins this feature of social inequality might be obliterated. It would appear, indeed, from the catalogues of the provision shops, that fish, flesh, game, vegetables, and fruit can all be supplied in tins; and we begin to anticipate that the geologist of the remote future may be puzzled to account for the empty-tin formation of our time, which he will recognize as contemporaneous with, but much more widely diffused than, the broken-bottle stratum of the High Alps. But if all our provisions are to be put into tins, it becomes important to learn how to get them out, and perhaps the instrument which Mr. Tallerman uses for that purpose will become as thoroughly domesticated in England as the corkscrew. We must confess, however, to a serious doubt whether these tinned provisions will ever be regarded as more than a tolerable substitute for butcher's meat. A member of Parliament invited to preside at a "repast" at the Lambeth Baths goes, and endeavours with reasonable success to look as if he liked it. He may perhaps honestly think that he is advancing a good cause, for which it is laudable to suffer a little not very severe martyrdom. To use a familiar phrase, it is all in the day's work. But it is difficult to believe that genuine enthusiasm could be excited by "these meats." Dickens, as we all remember, could write with enthusiasm about a pie, or a stew, but he was never called upon to deal with tinned provisions. The working class are laudably regular in observing Sunday, at least in respect of having a better dinner than on any other day. It would be absurd to suppose that those noble pies which may be seen returning home from bakeries about the time that morning-church comes out contain Australian meat, which is also quite unsuitable to enter into that arrangement of meat, potatoes, and pudding which is, we believe, called "a tond in a hole." In short, "these meats" are unsuitable for festive purposes, and suggest rather a hugger-mugger, hand-to-mouth, all-work-and-no-play sort of existence, which may be endured, but in which only a peculiarly constituted mind could rejoice.

THE MIDLAND MYSTERY.

IT is now several weeks since the Directors of the Midland Railway Company first announced certain changes in the working of their passenger traffic. The subject has been fully discussed, official and semi-official explanations have been given, and yet at the end of a month we are all in the dark as to what it is exactly that the Midland Company means to do. Whether the Directors of the Midland themselves know may perhaps be doubted. Their original programme has already been altered, and there are still several important points which are shrouded in an obscurity that would seem to be intentional. In the first instance it was stated that "return tickets at reduced fares" would be discontinued. Last week, however, the Chairman intimated that "an additional convenience to the public which the change will enable Companies to introduce is the issue of return tickets of both classes, without restriction as to the date of the return journey." Most persons accepted this statement without hesitation in its natural and obvious meaning. "Return ticket" is a technical term in common use which everybody understands. It does not mean merely a ticket for a double journey, but further implies, in accordance with invariable custom, that the price of this double ticket is less than the price of two single tickets. It was therefore assumed that the Midland Directors had on reflection abandoned their original intention of discontinuing return tickets, and that these tickets would be issued as hitherto at reduced fares. It now appears that this is not the case, and that when Mr. Ellis spoke of return tickets being issued, he used the phrase in an entirely new sense. This confession was extracted from him only by the direct questioning of Mr. Baines. Mr. Ellis is now obliged to admit that "it is intended to continue the issue of return

tickets to the first class, and also to issue them to third-class passengers, but at the double fare." In other words, passengers are to have the inestimable privilege of paying the Midland Company in advance for the ticket for a return journey without receiving any advantage in a reduction of price. This will relieve a passenger from the trouble of having to pay a second visit to the ticket-office; but, on the other hand, he exposes himself to the risk of losing the ticket and having to pay over again. Mr. Ellis will perhaps have something to say at the meeting of the Company on Tuesday next in explanation of this apparent want of candour. It must be remembered that this is really an important point as regards the new scale of fares. It has been represented that the accommodation for second-class passengers is to be improved without any additional charge; but it is clear that if return tickets at reduced fares are to be discontinued, this will at once make a sensible addition to the cost of travelling. For instance, the second-class fare from London to Birmingham is at present 15s., and this will continue to be the fare when first and second class are amalgamated. But the passenger having done his business in Birmingham wants to go home again. Under the new system he must pay exactly the same fare to go back as that which he paid in coming, making the cost of the double journey 30s. Under the existing system, however, he can go and come for 25s., by taking a return ticket. It is plain, therefore, that second-class passengers are to be made to pay for the cushions and carpets which are thrust upon them without being asked for. On the other hand, the first-class passengers, whose accommodation is to be reduced and degraded, and who, instead of travelling at ease, are to be packed as closely as possible, will be compensated only by a very trifling reduction of fare. A first-class return ticket to Birmingham, which now costs 33s. 6d., will under the new arrangement be 30s.

It will be observed that this grand scheme, as far as we know it, proves, when subjected to analysis, something very different from what was at first put forth. It was represented as a boon to first-class travellers in the shape of greatly reduced fares, and to second-class travellers in the shape of superior accommodation. It now appears that there will be an actual increase of second-class fares, and that the reduction of first-class fares will be infinitesimal in comparison with the discomfort which will accompany it. If the third-class return tickets at reduced rates which are at present issued between various places on the Midland line are also withdrawn and double fares charged, the third-class people, too, will suffer in pocket. When the new first-class carriages of the Pullman type are to be provided, and what fares will be charged for them, nobody knows. For the present they can only be regarded as a dream of the future. On the whole, then, this scheme, which was to be such an advantage to the public, turns out to be only a pretext for raising second-class, and perhaps in some cases third-class, fares, while an attempt is to be made to drive first-class passengers into a more expensive style of travelling. It is amusing to observe the elaborate statistics which are produced in order to prove that first-class passengers will not be incommoded by having the whole of the second-class traffic thrust in among them, and further that trains will be made shorter by transferring passengers who now sit in compartments which hold five on each side into compartments which hold only three on each side, and by adding huge Pullman cars as a substitute for the present first-class carriages. It is clear that either there will be more crowding, or the trains will be longer than at present. It is unnecessary to speculate on the possible or probable financial results of an experiment the conditions of which are not fully known, and which may perhaps never be tried. The Midland Company may or may not gain by the project, but it is at least absurd to represent it as a benefit for which the public should be grateful. It has been from the first almost universally condemned, and the disapprobation expressed at the recent meeting of shareholders merely repeats the general verdict of the public. Nobody will deny that the Midland Company has a perfect right to make such arrangements, within the limits of its Acts of Parliament, as it thinks best for its own interest, without reference to the effect of such arrangements on other Companies; but the wisdom of attempting to exercise such a right is another question. There is now so much intercommunication between railways that no Company can practically afford to consider only its own immediate convenience, and ignore the convenience of other Companies. It has been found, for example, impossible to have differences of fares on competing lines, and uniformity of accommodation is equally necessary. Possibly, however, it may turn out that, after all, the Midland Directors have had no other object in their threatened changes than that which Alcibiades is supposed to have had when he cut off his dog's tail—to make talk and occupy attention. The extended system of the Midland will soon be ready to be opened, and the present stir may perhaps prove a useful advertisement.

COMMON SENSE AND FANATICISM.

THE Alliance on the one hand, and the Licensed Victuallers on the other, seem to be making a satisfactory campaign. Sir Wilfrid Lawson has been speaking this week at Bristol and Sheffield, and he is not in the least discouraged at hearing from Mr. Bright that the prohibitionists have displayed a remarkable absence of wisdom in their proceedings, or at being told by the Solicitor-General that the same party are visionaries and fanatics.

Indeed it might be fairly said that the Alliance owes much of its success to the quality thus imputed to it. Sir Wilfrid Lawson will bring forward his favourite Bill next Session, and whatever happens, he and his friends will find encouragement to bring it forward again in the Session after next. The pleasures of hope are largely enjoyed by the Alliance, but the pleasures of memory would seem to belong chiefly to the publicans, who are able at their festive meetings to exult in the success with which they have thus far combined against powerful and zealous opposition.

Among statesmen who have had the sense and courage to maintain sound principles of legislation an honourable place belongs to Mr. Knatchbull-Hugessen, who some time ago defeated a Bill for closing public-houses on Sunday. This result he attained by proposing and carrying in a Committee of the House of Commons a Report by which the mischief of the Bill was forcibly exhibited. It is not surprising that the publicans should regard Mr. Knatchbull-Hugessen as their friend, and he with commendable boldness accepts and acts up to the character. He presided lately at a dinner given to Mr. George Candelet, the Secretary of the Licensed Victuallers' Defence League, and he made a speech which, being suitable for the occasion, was directly antagonistic to the recent speeches of Sir Wilfrid Lawson. It appears that the trade have subscribed for a testimonial to Mr. Candelet, who for a long period has exerted himself to defend its interests, knowing well that behind that trade, and under cover of the abuse with which it has been freely assailed, there was something else attacked, and that was the interest of the public. This is the language, slightly abridged, which Mr. Knatchbull-Hugessen used as chairman of a festive assembly largely composed of brewers and publicans, and it deserves to be heard by a larger audience. We have heard, he says, a great deal of very just and wise talk about drunkenness being the cause of a great deal of the crime which is perpetrated in this country, and no one denies it. But it is unfortunate that we have a number of zealous people who, when they see an object to be attained, rush frantically at it without particularly considering the methods which they take to accomplish it. Having established the fact that drunkenness is an evil, and ought as much as possible to be put down, a number of zealous gentlemen immediately rush to the conclusion that houses in which spirituous liquors are sold are public nuisances, and that licensed victuallers are public enemies. "That," says Mr. Knatchbull-Hugessen, "is a matter which we believe to arise from sheer prejudice." He asks, why do public-houses exist, and why has £17,000,000 been invested in this trade, and the answer is, because there exists a public want which must and will be supplied. It must have been delightful to publicans to hear the trade thus vigorously defended, and we think it a pity that such sensible remarks should not be circulated beyond the taproom. In the Report which destroyed the Bill for Sunday closing occur the words "Your Committee are of opinion that the safe limit of restrictive legislation has been reached." The author of these words may venture to quote them, not only in an assembly of well-lined publicans, but wherever an enlarged view of public interest may prevail. It is true that restrictive legislation has been carried further since that time, but it is also true that there is a limit which could not be safely passed. As regards Mr. Candelet, the hero of the evening, we may accept the assurance of those best qualified to judge that the testimonial which he received was well deserved. He assured the publicans that he was ready to defend their capital and interests in the future as in the past. "We must not," he said, "underrate the strength of our enemies. They are a determined class of people, and are led on by a certain number of zealous members of Parliament, who patronize and encourage them." The Chairman did full justice to the services of Mr. Candelet to the trade, not the least of which, in our judgment, is the inducement which his conduct of the publicans' case has afforded to Mr. Knatchbull-Hugessen to support it. The Chairman of course declared that he would not have supported the interest of the trade if he had not thought it identical with the interest of the public. "He believed that legislation which aimed at sending men to bed at a particular hour, or prescribed that they should only drink a glass of wine at a particular time, was an outrage upon public liberty." It was partly to proclaim this conviction that he took the chair. Speaking of the inequalities produced by the clause in the late Act as to "populous places," he said that the time must come when common sense would be the rule of legislation in these cases.

The importance of such a speech on such an occasion is considerable. The late Government was so dominated by a fanatical clique that we are glad to find one member of it who professes to take great principles for his guide. It would be well if those politicians of either party who agree with Mr. Knatchbull-Hugessen on this question would imitate his boldness in dealing with it. Truth is not less true because it is spoken to an audience of brewers and publicans after dinner. The influence which the trade exercised on the last election may perhaps be better understood by reading the speeches from which we have quoted. Sensible men may be supposed to have felt that which the chairman said, and we do not think they will feel it less after reading the recent speeches of Sir Wilfrid Lawson. He frankly declares that he is against spirits, beer, and wine alike. He would even prohibit the thin claret which we owe to Mr. Gladstone, and he thinks that refreshment-houses and grocers' licences are more mischievous than ordinary public-houses. He

has discovered a new argument for prohibition in the frequency of violent assaults, and he has also produced a new witness of the operation of the Maine Liquor Law. The Bishop of Lichfield is reported to have said that he had just come from travelling in the State of Maine, and "appearances there were very much in favour of the Maine Liquor Law." But appearances are sometimes deceptive, and all depends on how far the Bishop carried his investigation. There is unquestionable evidence that travellers who desire liquor can procure it, and we do not suppose that the Bishop of Lichfield alleges the contrary. But if the law be systematically evaded, that is a moral evil. We have enough shams of our own, and do not need to import another from America. "The people, badly educated, and unable to resist the craving of their appetite," of whom Sir Wilfrid Lawson speaks, might perhaps, if he went too far, proclaim their discontent so forcibly as to show him that the safe limit of legislation had been reached and passed. He neatly epitomized the argument against his own Bill by saying that he had been told that where people are sober they do not want his Bill, and where they are drunken they won't have it. This he says is a total misconception of the whole matter. But to us it appears an accurate statement of the case. He complains that in a thriving and industrious neighbourhood the publicans flock like vultures round a carcase, and move heaven and earth to get a licence from the magistrates. The speaker here gives rein to his imagination. Undoubtedly where a number of new houses are built it is usual to apply to magistrates for a licence to a public-house to supply what is called at Licensing Sessions "the wants of the neighbourhood." The publican is as inevitable as the butcher and the baker, and unless the whole population of a new town or hamlet are abstainers, he must be so. Applicants for licences, whether or not resembling vultures, do not usually appear in flocks, but of course there is competition in this as in other trades. It is strange that Sir Wilfrid Lawson cannot see in the process to which he refers the condemnation of his Bill. A railway station or some other cause induces building on a new site, and it is as much a matter of course to provide a public-house as a post-office. Suppose that only a quarter of the inhabitants use this accommodation, still they have a right to have it. Magistrates inquire how many people the place contains, and how far it is from an existing public-house, and decide to grant or refuse the licence. They do not usually grant so many licences as that it should be plainly impossible for the holders of them to make an honest living. On the other hand, they do not often carry restriction so far as to create a valuable monopoly in existing houses. Bishops and other possessors of good intentions and unpractical minds are always ready with proposals to limit the number of public-houses, but they do not remember that it would be impossible to limit their size or the extent of their business. There are some advantages in division and competition in this as in other trades. The question has, however, been settled for the present as far as Parliament is concerned, and perhaps the example of Mr. Knatchbull-Hugessen may induce other persons of influence to make a stand against fanatical absurdity, and to insist that the safe limit of restrictive legislation shall not be passed.

REVIEWS.

GREVILLE'S JOURNAL.*

(Second Notice.)

MR. GREVILLE'S facilities for acquiring political information are illustrated by his account of the change of Ministry in November 1834. It was his duty to attend as Clerk of the Council at St. James's when the King delivered the seals of office to the Duke of Wellington. The Conservative Privy Councillors were in an outer room when Lord Melbourne and his colleagues passed out of the throne-room after completing their formal surrender of office. "It was amusing to watch them as they passed through the camp of their enemies, and to see their different greetings and bows; all interchanged some slight courtesy except Brougham, who stalked through looking as black as thunder, and took no notice of anybody." When a change of Government occurred in one of the duchies of which the history is recorded by Shakespeare, the neutral philosopher of the lately exiled Court immediately resorted to the outgoing potentate, in the belief that there would be much to hear and learn from him. Mr. Greville was of a different way of thinking. "As I thought the company of those who were coming in would be more cheerful and agreeable than that of those who were going out, I passed my time in the outer room, and had a good deal of conversation with the Duke and Lyndhurst." A writer of Memoirs is fortunate in the opportunity of choosing between the confidential communications of the leaders of opposite parties. Two years earlier Mr. Greville's peculiar position had for a time converted him into an active politician, somewhat to the detriment of his proper function of contemporary historian. In 1832, when it was certain that the Reform Bill in its second version would pass the House of Commons by a large majority, Mr. Greville was employed in a secret negotiation between the moderate section of the Cabinet and the more prudent Conser-

vative peers who, under the guidance of Lord Harrowby and Lord Wharnclyffe, hoped, by assenting to the principle of the Bill, both to be enabled to modify its details and to avoid the threatened creation of peers. It is well known that the more important objects were attained, although, after the resignation of the Ministers and their return to office, the Bill was passed almost without alteration. It was fortunate that the so-called Waverers gave the Government a small majority on the second reading. Lord Grey and his colleagues failed to arrive at an understanding through Mr. Greville as to the changes which his Conservative principals were anxious to effect. His own feeling with regard to the Reform Bill had from the first been one of disapproval and alarm; but as the agitation in the country became more formidable, the obstinate resistance of the Duke of Wellington and Sir Robert Peel caused him deeper apprehension than the measure itself. One of his numerous comments on the Bill, written when it was first produced, displays remarkable sagacity. "If a vast difference is not made, and if the Bill shall still leave to property and personal influence any great extent of power, the Tory party, which is sure to be revived, will in all probability be too strong for the Reforming Whigs." Ten years afterwards, on the accession of Sir Robert Peel to office, the Whig party was for a time almost destroyed. During the negotiation with the Waverers, Lord Melbourne told Mr. Greville that he really believed there was no strong feeling in the country for the Bill; but he asked "what difficulty the Waverers could have in swallowing the rest after they have given up the rotten boroughs?" That is in fact the essential part of the Bill, and the truth is, I do not see how the Government is to be carried on without them. Some means may be found; a remedy may possibly present itself, and it may work in practice better than we now know of; but I am not aware of any, and I do not see how any Government can be carried on when these are swept away." Mr. Greville was naturally shocked with Lord Melbourne's apparent levity and characteristic candour. The inconsistency of his conduct with his language is partially explained by his later statement in a conversation at Holland House, that he had always foreseen that none but a sweeping Reform Bill was possible; and that for that reason he had always been opposed to Reform. The same practical indifference to apparent contradictions is amusingly illustrated in a trifling matter of business with which he happened to deal as Home Secretary. Edward Irving had applied to him to withdraw a prohibition against his preaching in the streets. The Divine command, as the eloquent preacher urged, was express—"Go into the highways"; and "they must obey God rather than man." "Melbourne said this was all very true, and unanswerable. 'What did you answer?' I said, 'I said, "You must not preach there."'" It is greatly to be regretted that the humorous wisdom of the Minister who was distinguished from all contemporary statesmen by a touch of genius should only be preserved in a few casual fragments.

During the Reform contest, and in the following years, Mr. Greville speaks of Sir Robert Peel with a curious mixture of censure and praise. It is by no means certain that Peel formed an erroneous judgment, either in his own interest or for the public good, when he steadily refused to assent to a measure which he soon found that it was impossible to defeat. Mr. Greville and Sir Robert Peel himself always retained the conviction that he might have easily procured the rejection of the Reform Bill if he had risen immediately after Lord John Russell's opening statement, and demanded a division. He was induced by Lord Granville Somerset to postpone the announcement of his opinion; and before the debate was over the agitation had become so formidable that it would have been impossible for the Ministers themselves to withdraw the Bill without a previous dissolution. It is impossible to judge whether it would have been better to postpone for a time the admission into the Government of democratic influences which have since been inevitably increased. The opposition which was offered to the Reform Bill by the first member of the House of Commons, and by the first member of the House of Lords, held the violent faction in check, and prevented the utter disorganization of the party which then assumed the name of Conservative. Mr. Greville judged correctly that it was impossible that the resistance should prevail; and Peel and even Wellington probably shared his views. His impatience with an opposition which might, as he thought, provoke popular irritation was explained by his right. When the struggle had reached its next stage he began to appreciate more justly the character and position of the Conservative leader. Mr. Greville was perhaps too severe on Lord Althorp, and he scarcely did full justice to some of his principal colleagues. While he admired Mr. Stanley's eloquence and vigour, he soon satisfied himself that he was an orator and debater rather than a statesman. At first grudgingly, and then without reserve or qualification, he records again and again his sense of Peel's unequalled ability and of his great position. "Peel is an enviable position; in the prime of life, with an immense fortune, *facile princeps* in the House of Commons, unshackled by party connexions and prejudices, universally regarded as the ablest man, and with (on the whole) a very high character, free from the cares of business, able to devote himself to literature, politics, or idleness, as the fancy takes him. No matter how unruly the House, how impatient or fatigued, the moment he rises all is silence, and he is sure of being heard with profound attention and respect." No other leader of the House of Commons has at any time exercised so undisputed a superiority. As it was said at the time, Pitt had his Fox, and Canning his Brougham, but Peel had

* A Journal of the Reigns of King George IV. and King William IV. By the late Charles C. F. Greville, Esq. Edited by Henry Reeve. London: Longmans & Co. 1874.

at that time neither an equal nor a second. A later generation has witnessed now for twenty years an equally balanced struggle between Mr. Gladstone and Mr. Disraeli. It may be added that great power was never placed in the hands of any statesman who used it with a more genuine patriotism than that of Peel. To the great and rising capacity of Palmerston Mr. Greville was, during Lord Grey's Administration, curiously obtuse. He even quotes with a kind of credulous sympathy the abuse of the Foreign Minister by the adverse diplomatists who were held in check by his vigilance and resolution. Princess Lieven assured Mr. Greville that Palmerston was mischievous, and Talleyrand more audaciously denounced him as imbecile. Mr. Greville, who at the age of forty was not a novice in society or in politics, might have suspected that neither the confidential agent of Russia nor the Ambassador of Louis Philippe would have felt insuperable objection to the tenure of the English Foreign Office by an incapable trifle. Some years afterwards Mr. Greville learned on good authority that, at the same time at which Talleyrand told Princess Lieven that Palmerston was an incapable trifle, he assured a confidential correspondent that in all Lord Grey's Cabinet Palmerston was the only statesman. Mr. Greville's judgment of Lord Durham was more accurate because it was derived from his colleagues. Although Lord Durham at that time hoped sometimes to take the place of Palmerston, and in more sanguine moments to become Prime Minister, it appears that his only hold on office was derived from the effect of his overbearing temper on the kindly nature of his father-in-law, Lord Grey. Even at Cabinet meetings Lord Durham was in the habit of giving way to bursts of passion which his colleagues would have resented if they had not been borne with patient equanimity by the Prime Minister. Mr. Greville himself states that his bad opinion of Brougham may probably have been aggravated by personal causes of offence, which he has not further specified. His accounts of Brougham's restless intrigues, of his judicial failings, and of the distrust which he inspired may be accepted as correct because they are confirmed by all contemporary records. After the resignation of Lord Grey, Brougham was rash enough to boast to Lord Sefton that he rejoiced in the change, because he could manage Melbourne better than Grey. Soon afterwards Mr. Greville remarks with some surprise that Lord Melbourne thoroughly understands Lord Brougham; and his discovery was confirmed when in the following year Lord Melbourne closed the official life of the great orator by refusing to admit him into the Cabinet.

Although Mr. Greville continued his intimacy with the Whig leaders, and after an interval of coolness again resorted habitually to Holland House, his own predilections became more and more Conservative as to persons, if not as to measures. He blamed the Opposition for defeating the Appropriation Clause, which might perhaps, if it had been adopted, have saved the residue of the Irish Church property. Mr. Greville's growing distrust of the Whig Ministers was caused by the language of their supporters, and sometimes of themselves, rather than by their political or legislative acts. It is strange in the present day to be reminded that in the reign of William IV., powerful nobles like Lord Althorp, the Duke of Devonshire, or the Duke of Bedford, could be described even in exaggerated phrase as Republicans. Lord Duncannon, during the short interval between two Administrations in which he was a Cabinet Minister, intimated to Mr. Greville that, if the Monarchy was destroyed, the King must take the consequences of his own folly. The most exclusive of aristocratic parties was scarcely conscious that its own power and privileges were more seriously endangered than the prerogative of the Crown. The not ungenerous illusion which had been cultivated by the Whig aristocracy from the days of the Stuarts has at last been dissipated by experience. While it lasted it was of great public benefit by facilitating the vertical cleavage of parties of which the divisions now more and more tend to coincide with social stratification. In seasons of agitation, the alliance of mildly revolutionary peers was at the same time an encouragement to demagogues and a restraint on their excesses.

On the dismissal by William IV. of Lord Melbourne's Government, Mr. Greville departed in some degree from his ordinary position of neutrality. He wrote an anonymous pamphlet in favour of the new Government, and he introduced Lord Lyndhurst to Mr. Barnes, the Editor of the *Times*, with a view to negotiations for a political alliance between that powerful journal and the Government. About the same time, at the request of Lord Lyndhurst, he recommended to his cousin Lord George Bentinck, who had the means of returning a member for King's Lynn, "young Disraeli"; but Lord George, who was at that time one of the few followers of Lord Stanley, "would have nothing to say to Disraeli." A dozen years were yet to elapse before Mr. Disraeli converted Lord George Bentinck into a statesman, becoming himself his indispensable lieutenant and his destined successor. A second period elapsed before Lord Derby depended on the Parliamentary management and the political inspiration of the rejected candidate for Lynn. Mr. Greville blamed Sir Robert Peel for entrusting the office of Secretary of the Board of Control to Sydney Herbert, an inexperienced young man of quality, when he might have preferred Mr. Gladstone, who was, as Mr. Greville justly remarks, "a clever man." Mr. Reeve properly calls attention to Peel's solicitude and sound judgment in selecting and training young aspirants to a political career. Mr. Gladstone, Mr. Sydney Herbert, Lord Cardwell, Lord Dalhousie, Lord Canning, and the Duke of Newcastle, were all pupils of the great

Minister who had first discerned their merits. Mr. Greville failed at the time to appreciate the result of the election which followed the Ministerial crisis of 1834. The Opposition boasted that they had a majority of 100 in the boroughs; but the counties, which in 1831 and 1832 had enthusiastically supported the Reform Bill, now returned to their natural preference for Conservative principles. On the strictly party division on the choice of a Speaker, Mr. Abercromby defeated Sir O. Manners Sutton only by 316 to 306. Mr. Greville was indignant at the factious opposition, as he deemed it, of the Whigs, and he was alarmed at finding the Government in a minority. Sir Robert Peel, with a sounder and calmer judgment, told him that the country was on its legs again, and in answer to an expression of surprise and incredulity he repeated, "Yes, the country is on its legs." The ex-Ministers often avowed to Mr. Greville in conversation their resolution to punish the King for the supposed abuse of his prerogative by forcing themselves back into office. When they sometimes admitted that they had no definite policy nor distinct anticipation of the future, Mr. Greville severely blamed their inveterate hostility to Peel, since they recognized his ability and found little fault with his measures. It is probable that his Whig friends were well aware of his Conservative inclinations; and that they were not disposed to submit their opinions and purposes to unfriendly criticism. Sir Robert Peel was perfectly justified in holding that the Conservative cause, which he identified with the country, was again on its legs. During Lord Melbourne's second Administration the Government was powerless for evil, although, with the aid or connivance of the leader of the Opposition, it passed the Municipal Reform Bill and other useful measures. It would have been more difficult for Peel to induce his followers to consent to the introduction of Government measures involving necessary changes than to prevent them from offering an active resistance to Whig proposals. The party lost little by the resignation of Sir Robert Peel's Government after his gallant struggle with superior forces. He had in a few months reduced the hostile majority to twenty or thirty votes; and he had convinced the entire nation that he was the ablest statesman and the most enlightened administrator of the time. The completion of the necessary coalition with Stanley and Graham was more easily effected in Opposition than when Peel and Wellington were the immediate successors of the Government of which Lord Stanley had been a conspicuous member. After 1835 Mr. Greville could no longer suspect that Sir Robert Peel would be overruled by the Duke of Wellington, or doubt that he would direct the policy of the party in Government or in Opposition. The disruption of 1846, which was the greatest blow ever inflicted on the Conservatives, would have been avoided if to his great qualities Peel had added the invaluable faculty of tact and personal management. The unpublished portion of the Memoirs will probably enable posterity to form a fuller judgment of the conduct of all parties at the time when Lord John Russell coalesced with Lord George Bentinck to drive from power the chosen enemy of one and the political competitor of the other. The pretext was the Irish Coercion Bill, on which both Lord John Russell and Lord George Bentinck agreed with the Minister whom they outvoted; but the cause was the repeal of the Corn-laws, of which Lord John Russell only was a supporter. An earlier part of the Journal will record the employment of Mr. Greville by Lord Melbourne to supply Sir Robert Peel on his accession to office in 1841 with confidential information which might facilitate his relations with the Court. Mr. Reeve has probably exercised a sound discretion in postponing for a time, which, it may be feared, will be long, the publication of the later part of the Memoirs. He is fortunate in the merited confidence which has enabled him to produce in the present instalment of the Memoirs one of the most valuable publications of the time.

ISMAILIA.*

THE two handsome volumes before us, profusely illustrated with the most thrilling pictures of adventures with hippopotami and battles with natives, contain the record of more than three years' operations by Sir Samuel Baker and his followers in the basin of the Upper Nile. The book is not uninteresting as a record of travel. Sir Samuel Baker, as we all know, is a man of extraordinary strength and courage, and he can tell a story of adventure in a plain, straightforward style, without unnecessary circumlocution, and without any attempt at fine writing. If we can scarcely give him credit for unusual literary power, we may fairly say that his books are much more readable than the average descriptions of African travel. In his present book, however, the traveller is but a secondary character. The book should rather be compared to Caesar's Commentaries or the Wellington Despatches. It is the account by the commander himself of a military expedition; and though Sir Samuel's enemies were savages, and the victories were necessarily of a simple kind, the fighting is sufficiently exciting; and one part of the story strongly recalls the march to Coomassie, with the exception that it deals with a retreat instead of an advance. And yet the book is perhaps less interesting as a military narrative than from the light which it throws upon the condition of a part of Central Africa which has long possessed a peculiar interest, and which is now being gradually annexed to the civilized world. Here, indeed, as elsewhere, civilization,

* *Ismailia*. By Sir Samuel W. Baker. London: Macmillan & Co. 1874.

as Hosea Biglow expresses it, gets forward "upon a powder-cart," or, in other words, the natives are being improved at the point of the bayonet. There is frequently a difficulty in such cases in distinguishing as clearly as might be wished between civilization and extermination. In this instance, however, there is at least no change for the worse. The scene of Sir S. Baker's operations was not in any idyllic state of nature to begin with. Commerce is in a very active state, but unluckily the natives are themselves the articles of export as well as the exporters. Bands of slave-traders fight their way in every direction; kill the men, carry off the women and children and cattle; and, if they pay for ivory at all, pay for it in the slaves or cattle stolen from some neighbouring tribe. In the chaotic state of the country the tribes alternately become the victims and the allies of the slave-hunters; and as their operations gradually extend further, the area of murder and misery spreads with them. To put a stop to such a state of things was an object which might well justify Sir Samuel Baker's aspirations for divine protection at starting, and his gratitude to divine assistance on the final attainment of some measure of success.

And yet it is painfully obvious that there are many drawbacks from any sanguine estimate of the results obtained. In the first place, the Egyptian Government, whilst it empowered Sir Samuel to suppress the slave-trade, was at the same time indirectly drawing a revenue from the slave-traders. The country which he has annexed was farmed out to slave-traders previously to its annexation. The man most responsible for all the evils of the system was, according to Sir Samuel, a certain Abou Saoud. This man, we are told, farmed the right of slave-hunting from the Soudan Government; he was protected more or less directly by all the minor Egyptian officials, and he had sympathizers even among Sir Samuel's own subordinates. Whilst Sir Samuel was the representative of the supreme authority, he was not only met at every step by the machinations of the superior officials, banded together in a tacit conspiracy to support the very system which he was to suppress, but Abou Saoud actually prompted direct attacks upon the troops of the Government, which were sometimes made by natives at his instigation, and in one case by men directly under his command. Thus, whilst the Government ostensibly attacked the slave-trade, its officers and those whom they protected were at actual war with the assailant of the slave-trade. Abou Saoud appealed to the Khedive, and he has been appointed assistant to Colonel Gordon, Sir Samuel's successor. It remains to be seen whether, as Sir Samuel seems to think, this means that the slave-trade will be protected, or whether it is an application of the old principle—sanctioned, as we may observe, by Sir Samuel's own practice—of setting a thief to catch a thief. Sir Samuel formed a body of irregular troops from Abou Saoud's subordinates, and perhaps it may answer to enlist Abou Saoud himself. This, however, is a question which we cannot discuss. We must add, in the second place, that Sir Samuel was forced by his position to employ methods of warfare which must have been rather confusing to the native mind. If everywhere, it is true, sets his face against slavery, but he had to appeal to the natives, not as an abolitionist, for the institution is rooted in their whole national customs, but as the liberator of the slaves of one particular tribe. Their version of the Commandment, as he pithily puts it, is not "Thou shalt not steal," but "Thou shalt not steal from me," which is a very different thing. And thus he was compelled, by the force of circumstances, to be the ally of one tribe against another, and to confiscate cattle and land, from the best of motives, but still in the old style; and it is not impossible that some at least of the natives may have seen in him, not an exterminator of certain social evils, but one more force in the general scramble for power. Let us, however, give a brief summary of Sir Samuel's proceedings as related by himself.

Many months of the year 1870 were wasted in a vain attempt to force the obstructions in the river. Vast masses of floating vegetation had choked the stream and converted it into a mere series of morasses, where the current was nearly lost, and where a passage had to be forced by cutting canals and hauling the fleet over mud. In December, however, he started again, and after tremendous exertions he at last escaped by the help of a dam built across the river, which raised the level at a critical point sufficiently to make a passage practicable, and he reached Gondokoro in the middle of April 1871. The rest of the year was passed in forming a station called Ismailia, and in a war with the Bari tribes, of which we shall speak directly. In the beginning of 1872 he started for the South, and at the end of April reached Masindi, the capital of the Unyoro country, governed by one Kabba Réga. This was annexed by proclamation; but Kabba Réga, instigated by the arch-sinner Abou Saoud, made a treacherous attack upon Sir Samuel's settlement, which, although repulsed with great loss to the natives, necessitated a retreat to the station of Fasiako, formerly Abou Saoud's headquarters, and halfway between Masindi and Gondokoro. Here Sir Samuel erected another fort and governed the country peacefully for some months, after repelling an attack from the slave-traders. His allies meanwhile attacked Kabba Réga, and turned him out of his kingdom. Having thus annexed the Unyoro district, and cleared it for the time from slave-traders, Sir Samuel returned to Gondokoro or Ismailia in the beginning of 1873, and, his period of rule having expired, came home to England. His army at one time amounted to about one thousand five hundred men, many of whom were useless and disaffected; but desertions, disease, and the necessity of leaving garrisons behind him, reduced his effectives at the furthest point to little over a hundred men. His bodyguard, appropriately

christened the "Forty Thieves," appear to have reached a high state of discipline and decided most of the battles. With such small means he must undoubtedly be admitted to have worked wonders; and though he lost many of his best men, both European and native, his own strength and good fortune brought him safely through all dangers of war and climate. The powers of endurance of himself, of Lady Baker, and of Lieutenant Baker, his able assistant, are indeed worthy of all admiration.

From this brief summary it will be seen that Sir Samuel's military rule was no sinecure. The natives were by no means unanimous in welcoming their deliverer. Indeed there is something almost comic in Sir Samuel's indignation at their stupidity and treachery. The Bari, he tells us, were "most brutal and obdurate savages." The fact is that they could not understand Sir Samuel's arguments. When he reached Gondokoro the Bari had been driven out of their lands by another tribe, in vengeance for their complicity with the slave-hunters. Sir Samuel annexed the pastures thus deserted, which, as he puts it, "having been abandoned by them and occupied by the Government troops, had naturally become the property of the Khedive. The natives had no more right to the soil from which they had been driven than the French would have to Alsace and Lorraine, should those provinces be occupied by a foreign Power which had driven out the Germans." The obtuse savages, however, obstinately held that the land was still theirs; they impudently drove their cattle to feed upon it, and refused even to sell them to Sir Samuel when his supplies ran short. Of course there could be only one end to such a discussion. Sir Samuel had to take the cattle by force, though he promised to pay for what he ate. Meanwhile, Abou Saoud, that author of all evil, quietly appropriated a herd of cattle belonging to another tribe which was in friendly relations with Sir Samuel, and encamped with them near the station. Sir Samuel righteously appropriated this herd in order to restore them to the first owners. These owners, however, suspected Sir Samuel of complicity in the transaction, and before he could explain his intentions, murdered some soldiers whom he had left in their neighbourhood. After this, of course, it became impossible to restore the cattle, as such a proceeding would have looked like fear. Though in all these proceedings Sir Samuel was acting on the strictest views of international law, we cannot be surprised that the natives were obtuse enough to suspect the benefactor in disguise who had thus annexed their land and taken their cattle in pawn, and that they foolishly attacked his troops and got severely punished in return. After this warning, Sir Samuel still found that he could not get enough corn to feed his troops, and that some of his own officers, who were tired of the expedition, and the slave-hunters with whom they sympathized, calculated upon the want of corn to force him to retreat. As the natives would not sell their corn, he was again compelled to take it, and had a couple of little campaigns which involved a good deal of burning villages and shooting obtuse savages. At length an odd incident brought about a better understanding. Sir Samuel shot two elephants, and the natives, who would not take cattle for corn, immediately made peace to have a share of the elephants. Perhaps the fact that they had been thoroughly defeated by Sir Samuel and his "Forty Thieves" had some share in bringing about the result.

The difficulty with the natives of Unyoro was a still more serious affair. This kingdom, being further from the attacks of the slave-hunters, seems to possess more coherency than the rude aggregations of tribes to the North. His present Majesty, Kabba Réga, is the sixteenth of his dynasty. He is the son of Kamraa, king at the time of Sir Samuel's former visit; and came to the throne with the usual ceremonies. In other words, he murdered his brother and most of his relations, and having thus cleared the succession, paid the usual honour to his father's memory by burying him along with several of his wives, and a number of other living persons, who had been seized for the purpose. This appears to be the regular constitutional custom, and Kabba Réga might have been a happy ruler but for two things. One was the existence of a certain Rionga, a kind of Don Carlos of the district, who held out in a neighbouring province. The other was the company of the slave-dealers, who found an excellent market in Unyoro. It seems that a girl can be bought in the neighbouring country of Uganda for thirteen needles, and exchanged in Unyoro for an elephant's tusk worth 20*l.* or 30*l.* The process was often simplified by kidnapping the girl; and the country had been devastated by the disgraceful oppressions which naturally resulted. Meanwhile, however, Kabba Réga seems to have oscillated between hoping to share the slave-traders' profits and a feeble desire to resist their exactions. They could always keep him quiet by threatening to take the part of the pretender Rionga. When Sir Samuel appeared on the scene, and benevolently annexed Kabba Réga's country, these doubtful allies had to leave the place; but Kabba Réga was not very grateful for the service, and could not understand why Sir Samuel refused to help him in suppressing Rionga. What other motives he may have had for his treachery does not very clearly appear. Perhaps he saw that, as Sir Samuel had a great deal of wealth, very few soldiers, and was at enmity with the slave-traders, the only other power in the country, he could easily be robbed. At any rate, just as Sir Samuel was perfectly confident of his position, Kabba Réga made an attempt, very nearly successful, to poison the whole party, and then attacked the station with some thousands of natives. Sir Samuel lost all that he had brought; and only effected his retreat at the cost of over a fortnight's fighting

through a series of ambuscades. If the natives had shown a little more strategy, and harassed him by night attacks, the weary and overladen party must have been ultimately destroyed. After this retreat the slave-traders attacked Sir Samuel's party, and were defeated in a pitched battle. Rionga, strengthened by the support of Sir Samuel, crushed Kibbi Riga in his turn, and the whole country had peace. For some months, at any rate, there were no slave-hunts in the district, the people gained confidence and paid taxes, and Sir Samuel established forts enough to maintain the authority of Government. Whether the good effects will be permanent, whether such tribes as we have described can be converted into peaceable agriculturists and traders, to say nothing of any higher reform, is a question for the future. Empires which are founded by sheer force may become civilizing agencies when they are consolidated. We fear, however, that it must take some time to extirpate bad habits so deeply rooted as those described in *Ismailia*.

FITZGERALD'S ROMANCE OF THE ENGLISH STAGE.*

WE have more than once had occasion to comment upon the custom which has lately threatened to become prevalent of making new books out of old ones—a custom more honoured in the breach than in the observance. It is true that when copies of old books are exceptionally rare—as Mr. Fitzgerald is careful to say is the case with many—which he has laid under contribution—he who collects their best and most interesting passages and works them into a readable and amusing form may be doing good service. For the accomplishment of this object two things are necessary—a light and skilful hand, and a moderate amount of care. The former of these qualifications is not attainable by everybody; the latter is. When Aladdin, in the story of *Aladdin*, cried “New lamps for old ones!” through the town, it may be supposed that he took pains to give to his wares a brilliancy and polish which should make them attractive, at least upon a first sight.

Mr. Fitzgerald introduces his book with some remarks upon the reasons for the favour which dramatic entertainments have found among all people at all times. Some of these remarks are true enough, but they have been better and more tersely expressed by Shakespeare in the play which is probably last known to every one at the present moment. Other remarks which follow these are not quite so true. The author states that in the theatrical history of other countries—notably, in that of France—there is not the same adventurous interest to be found as in that of England. “With a few exceptions,” he goes on to say, “the lives of foreign players show the regular and perhaps uninteresting progression found in other professions.” It would not be difficult to find many answers to the first of these statements. To take two instances from the theatrical history of France, there is scarcely an incident in the history of the English stage to match the “adventurous interest” of the great Napoleon drawing up, signing, and despatching a list of regulations for the conduct of the *Théâtre Français* just before the attack upon Moscow. Again, there seems a strong element of “adventurous interest” in the performances given by Adrienne Lecouvreur in the camp of Marshal Saxe, and in the unhappy story of the actress's death. As to the author's second statement, it is no doubt true that during the times of which the book treats the lives of foreign have been, as a rule, more regular than those of English players. The reason of this is to be found in the contempt which attached to the actor's profession for a longer period in England than elsewhere; and one would have thought it hardly worth while to call attention to a fact which is certainly not to the honour of England. The players themselves would probably have found a chance of “the regular progression found in other professions” quite as interesting as the band-to-mouth and vagabond existence to which they were condemned. Later on Mr. Fitzgerald thinks that the want of interesting theatrical memoirs in the present day is to be traced to the decay of acting and to the fact that “the actor's life, in proportion as his art has fallen away from the old high ideal, offers nothing striking or genuine.” Whether such a want in fact exists may be questioned, and that the art of acting is in such a lamentable state of decay may be denied. It is no doubt true that those who praise a bygone time have during the past few years had good grounds for drawing unfavourable comparisons between the then condition of the stage and that which they knew in earlier years. It is equally true that a reaction in favour of a high class of plays and players has lately set in. It is curious that Mr. Fitzgerald admits this fact in the very next chapter to that in which he laments the decay of the stage. An outcry over this real or supposed decay has indeed been common enough in the case of every theatre of every nation among those who, witnessing the acting of one generation, remember that of another. That this should be so is only natural. The old playgoer is not sorry to establish a superiority over the young one by virtue of his memory, which probably is kind both to him and to his favourite actors in hiding their defects and exalting their merits. He is glad to accuse the members of a younger generation of a fault which they certainly cannot repudiate, and could hardly have avoided—that of never having seen such or such an actor, who died before they were born. It would

seem that in the matter of acting, as in many others, “man never is, but always has been, blessed.”

The second chapter of Mr. Fitzgerald's book is devoted to an account of the kind of life led by strolling players. Several pages are extracted from nine volumes of *Memoirs* written by one Ryley, a strolling manager, which are said to have become very scarce. If the part which the author has extracted is a fair sample of the whole of the nine volumes, their scarcity has inflicted no great loss upon the public. More amusing is the account given by an actor named Bernard of Manager Penchard, who possessed a full-bottomed wig which Colley Cibber had worn in *The Rags*. He had so great a belief in the virtue of this wig that in it he invariably played Hamlet, Don Felix, Lord Townley, and Zanga. Hamlet in a flaxen wig was at first considered a startling innovation; the vision of Hamlet entering “as if returning from the judicial bench” is indeed portentous. Besides the wig Penchard was much troubled with gout, so that he played Plume, the young hero of *The Recruiting Officer*, with one leg wrapped in flannel and seated in an armchair. Whenever he was supposed to make an entrance or an exit the curtain was lowered while he was wheeled off or on the stage, in order that the illusion might be as little as possible destroyed. The comedy of his performance seems to have depended entirely upon his constantly taking snuff, much as that of some modern comedians does upon their constantly smoking. The chapter which the author has headed “The Old York Theatre” contains some amusing instances of the intense belief in their own particular performers which prevails in country audiences. On one occasion, when reports of Garrick's fame reached Liverpool, much excitement was caused by the doubt as to whether he could be greater than the Liverpool actors. A deputation going up to town on corporation business was desired to examine Garrick's performance and report. On their return the public mind was much relieved by hearing “that Gibson and Ridout were on the whole superior.” Gibson and Ridout, who but for this incident would probably have remained unknown to fame, might congratulate themselves upon finding so much honour in their own country. Frodsham, who was known as “The York Roscius,” also stood very high in the estimation of his townsmen and himself. Tate Wilkinson, the well-known York manager, gives an account of a visit which he paid to Garrick in London. The great actor not unaturally concluded that the country star had come in order to solicit a town engagement, whereas nothing was further than that from Frodsham's thoughts. Garrick's vanity is almost as well known as Goldsmith's, and one can imagine how much high comedy there was in the scene between the two actors, wherein Frodsham coolly criticized the great man's performance, and compared it with his own. Garrick was a little staggered by their first interview, when the country actor spoke with kind discrimination of his Hamlet; but he was yet more so by the second, which followed upon Frodsham's going to see his *Sir John Brute*. When asked for his opinion upon this performance, “It was beyond my comprehension,” replied the York star. “Having seen your play Hamlet first, your *Sir John Brute* exceeded my belief, for I have been told Hamlet, Mr. Garrick, is one of your first characters; but I must say, I flatter myself I play it almost as well; for comedy, my good sir, is your forte. But your *Brute*, de-n-it, Mr. Garrick, your *Brute* was excellence itself!” Later on, when Frodsham had recited Hamlet's first speech, Garrick spoke approvingly of his performance, adding, “In some passages you have acquired tones I do not by any means approve.” Frodsham tartly replied, “Tones, Mr. Garrick! to be sure I have tones, but you are not familiarized to them. I have seen you act twice, Hamlet the first, and I thought you had odd tones, and Mrs. Cibber strange tones; and they were not quite agreeable to me on the first hearing, but I dare say I should soon be reconciled to them.”

Tate Wilkinson, the recorder of this curious scene, was himself the hero of some strange adventures. His own first appearances at York suffered very unfavourably by comparison with the established actors there, whom the townspeople very generally agreed in preferring to “that man from London.” On one occasion a ridiculous account of Major Sturgeon's adventures in Foote's *Mayor of Garratt* was taken as a personal affront by the militia officers quartered in the town. If history is to be believed, the very same absurd incident which Foote had invented for his *Mayor* had occurred to the commanding officer at York only the day before the farce was performed. This looks very like an excuse invented afterwards by the militia officers to palliate in some sort their outrageous conduct. However that may be, the unfortunate comedian was put to some straits to escape the vengeance of a sergeant and five or six soldiers who were waiting outside the theatre after the play with orders to beat him unmercifully and duck him in the river. Wilkinson's progress on the London stage was by no means unattended by difficulties. It would have been wonderful had it been so, considering that his success was based upon the dangerous talent of mimicry. He was unfortunate enough at an early stage of his career to offend Mrs. Woffington, whose continued rancour towards him shows her character in a light far less favourable than that which is cast over it in the comedy of *Masks and Faces*. The young actor had to encounter a great deal of opposition of the same sort from older players whom he had the audacity to mimic; and not his least difficulties in this way were caused by Foote, who introduced him to the London stage; but in the end his talent triumphed, and he became, as the manager of the York Theatre, almost as well known as Garrick himself had been. There are some valuable passages,

* *The Romance of the English Stage*. By Percy Fitzgerald, M.A., F.S.A. 2 vols. London: Richard Bentley & Son. 1874.

expressed in odd enough English, upon the actor's art in his memoirs, one of which may be quoted:—

There is another (danger) that actors incur, which manifests negligence, and is, as Mr. Garrick told Shuter, not to be too comical. O comical actor! it is a debt and a dangerous debt, not easily forgot or forgiven; for how can the performer think that though perhaps the town last night laughed and gave indulgence, that he is free? so far from it, he has lost the golden ore, their good opinion, and it will take a long time to regain it: for the actor is dreadfully wrong who thinks, because himself and friends laugh at what is termed jokes out of all time, place, and character, it is forgiven in general, and not set down against him, and mentioned for a twelvemonth at least by the judicious; and though this may be cruel, it is in some degree just, and should not be so frequently deserved. I would have all thrust for applause, but let the means pursued be professional and characteristic to deserve it.

It is difficult to imagine why certain of these words are printed without any apparent reason in Roman type, while the rest are in italics. The substance of the passage might be studied with great advantage by those actors of the present day who depend for their success upon what is termed "gagging."

A good deal of interest attaches to the first appearances of Garrick, Mrs. Siddons, and Edmund Kean. Garrick, whose name was not announced, made his first public appearance—for those few which he had made previously at Ipswich can hardly count for anything—in a small unlicensed theatre in the character of Richard III., and took the town by storm at once. The audience were amazed by his power and the novelty of his method. "The surprising novelty was remarked that he seemed to identify himself with the part." This suggests curious reflections as to what manner of thing acting can have been before Garrick hit upon "this surprising novelty." Mrs. Siddons's first appearance was very different from this, being a complete failure. This, however, she entirely redeemed by a second attempt, which was as well as the other had been ill received. The most curious of these first appearances was undoubtedly that of Edmund Kean, who had everything against him. There was but one rehearsal of the play, the *Merchant of Venice*, at which he was coldly and discouragingly received by the actors, the stage manager, and even the manager who had engaged him. He crept to the theatre at night through rain and slush, and found an empty house, with only about fifty people in the pit. These fifty, however, managed to discover before long that they were in the presence of a genius, and asserted their conviction so strongly that the actor's future success was at once assured. "How the devil so few of them managed to kick up such a row," said Oxberry, "was something marvellous." Kean's subsequent history, of which Mr. Fitzgerald makes no mention, is in outline at least tolerably well known. The record of his first appearance closes the first volume of Mr. Fitzgerald's book. The second opens with a sketch of Mossop, "the ill-fated Mossop," as he was called. But in truth he himself was far more to blame than was fate for his evil fortune. He was engaged very early in his career by Garrick at Drury Lane, where he might always have held his own well had not his overweening self-conceit led him to see a jealous rival in one who was in truth a kind patron. His style appears to have been as different as possible from Garrick's, and moreover to have possessed an excellence of its own in certain parts which Garrick scarcely ever touched. It was the more unreasonable in him therefore to misconstrue, as he constantly did, the manager's motives, a mistake in which he was ever sustained by ill-advised friends, foremost among whom was one David Williams. Garrick's behaviour to him was indeed uniformly kind and courteous, as Mossop himself acknowledged in some moments of clear and unbiassed judgment before his death. Following the history of Mossop comes a collection of remarkable instances of love and death as exemplified upon the stage. The story of Conway and poor Mrs. Piozzi's innocent, but foolish, infatuation for him is already so well known through Mr. Hayward's memoirs that one would have thought it was hardly worth while to rake it all up for the second time. It is true that a new element is given to the history by the author's running commentary upon it; this, however, is a novelty with which one could easily dispense. It would be difficult to make the history of the Ireland forgeries uninteresting, well-known though it is. Readers generally derive great pleasure from contemplating the record of their forefathers' folly and congratulating themselves upon their own wisdom. It would indeed be surprising that so impudent an imposture as Ireland's should have obtained so much success as it did, had not modern events shown that the success of impositions may vary in proportion to their audacity. It must have been a bad moment for the supporters of Ireland's *Fortigern* when Kemble delivered with grim humour the line, "And when this solemn mockery is o'er," and thus put the finishing stroke to the wretched imitation of Shakespeare.

There are one or two amusing stories told in the *Romance of the English Stage* concerning Cooke—George Frederick Cooke, as he loved to be called—who might have been a great, if a peculiar, actor, but for his unfortunately self-indulgent habits. The record of his days is a disagreeable thing to contemplate, and it is pleasant to turn from him to Elliston, the whimsical creature of his own romance, who managed to be dignified through all his outrageous lies, and of whom Charles Lamb has given a brilliant and life-like portrait. The secret of his attraction and his influence over an audience seems to consist in the fact that, like Corneille's *Menteur*, he himself always believed firmly in his extravagant assertions. He had, too, a most wonderful readiness of resource; no scrape could overcome him; once he quelled a threatened riot in his theatre by directing all his explanations to one man alone

among the audience, and taking advantage of the fickleness of a mob to engage the sympathies of the spectators with him against their own solitary representative, until they rose and turned the wretched man out. Mr. Fitzgerald gives us one curious piece of information about Elliston:—"Though his father was a watchmaker, his other connexions were respectable, and his uncle a dignitary of one of the Oxford Colleges." It is quite a new discovery that watchmaking is not a respectable calling.

The concluding chapters of Mr. Fitzgerald's book are occupied with memoirs of Gerald Griffin and of young Betty. Gerald Griffin's story, which the author has collected from Griffin's letters and other sources, is pathetic enough, but has, in fact, mighty little to do with the stage. His tragedy of *Giuseppe* obtained a good deal of success when first produced by Macready; but Griffin's name is far better known by his beautiful story of the *Collegians* than by any of his writings for the stage. Mr. Fitzgerald concludes his remarks upon Griffin by saying that "there is no such affecting chapter in the whole pathetic chronicle of the stage." The reader's belief in this is a little murred by the fact that Mr. Fitzgerald has already said very nearly the same thing of several other chapters in the chronicle of the stage. That there is plenty of material for romance in that chronicle there can be little doubt. There is still less doubt that Mr. Fitzgerald has turned this material to a very poor account. In his *Romance of the English Stage* there is but meagre information about the stage, and the romance has to be supplied by the reader's imagination.

STRAUSS'S LIFE OF ULRICH VON HUTTEN.*

OF the three minor works of Strauss, which are not widely known beyond the limits of his own country, his *Life of Hutten* is perhaps the most important; certainly it is the most interesting to the general reader. First published in 1853, and republished in an altered form in 1871, it had avowedly in either case something more than a merely literary or historical purpose. Indeed Strauss, like the late Mr. J. S. Mill—to whom he may in some respects be compared, and not least for his admirable lucidity of style—was incapable of treating with philosophical calmness subjects which deeply stirred his emotions. He tells us that he was first prompted to write about Hutten by the Austrian Concordat and the servile contract with Rome with which the other German States were threatened. "Words in season were found in the Knight's invectives against Rome, the foe of light and liberty; and his earnest appeals to the Germans to stand firm and united against the insolence of the foreigner." And the second edition, of which the present work is a translation, or rather an abridgment, was expressly directed against "the jealous administration of priestly obscurantists," whom Strauss still regarded as dangerous foes of liberty and culture within the restored German Empire. It is therefore with a special meaning that he is fond of calling his hero "the Knight," and not simply because Hutten himself through life combined warlike with literary tastes and avocations, and filled none of his portraits so well as those which represented him in arms. In the eyes of his biographer he is the leader of a national and religious crusade for the greatness of Germany and against every species of "sacerdotalism"—by which Strauss would mean supernaturalism—which began with the Reformation and was never in more need of being vigorously prosecuted than now. And neither hero nor biographer was averse to combining carnal with spiritual weapons in a contest of such magnitude and momentous import. As to Hutten, his aims were always more secular than strictly religious, and, as Luther complained, he "wished to fight for the Gospel with fire and sword," and did so whenever he had the opportunity. Thus, for instance, on one occasion he attacked three abbots on the high road; on another he seized Hochstraten the inquisitor, and threatened to put him to death; if we may believe Erasmus, he had the ears of two Dominican friars cut off; and he says himself in a letter to his friend Foban Hesse, that it was by no fault of his the papal nuncios had escaped after the Diet of Worms; he had laid ambuscades for them, but the Imperial army had protected them. In the same spirit Strauss, while admitting that there was not much to choose between the oppressive conduct of the Catholic and Protestant princes of Germany towards their subjects of a different faith, adds that "there was yet an essential difference," because the latter acted in unison with the spirit of progress, while the former thwarted it. But as every persecutor considers that his own side is that of true progress, or at least that the progress he is opposing is only progress to the abyss, this looks very like justifying persecution, so long as the right victims are burnt, and not the wrong ones. Be that as it may, however, we can heartily welcome this biography, for its intrinsic interest, and Mrs. Sturge's on the whole excellent translation, quite apart from the particular theories or motives of the author in composing it. And we do so the more readily because we fear the translator is right enough in saying that to the majority of English readers Hutten is "little more than a name," though of course the name at least of the principal author of *Epistolæ Obscurorum Virorum* must be familiar to every educated man.

Hutten's life, though it barely reached half the ordinary span allotted to man, was in one sense an eventful one, for his restless spirit never suffered him to remain long in one place or one em-

* *Ulrich von Hutten. His Life and Times.* By D. F. Strauss. Translated by Mrs. G. Sturge. London: Daldy, Isbister, & Co. 1874.

ployment; but its interest for us centres almost wholly in his literary efforts and his distinguished literary friendships. His spasmodic and impetuous attempts at a more active interference in public affairs proved invariably failures, and rather damaged than aided his real and permanent influence. But the friend of Reuchlin, Erasmus, Mutianus Rufus, Eoban Hesse, Crotus Rubianus, and Franz von Sickingen, and the associate of Melancthon, Zwinglius, and Luther, must have been no inconsiderable personage in his day. And the fact that he represents, more truly than any of his contemporaries, the meeting point, which is also the point of divergence, between the "Humanistic" and Protestant tendencies of the Reformation era, gives to his career its most characteristic significance. Like Luther, he began his career in a cloister—not however, like Luther, from deliberate choice, but because he was sent as a boy of eleven to the Benedictine abbey of Fulda by his parents, not only for education, but "with the intent that he should stay and become a monk." But the boy was otherwise minded, and at the age of seventeen he escaped from the monastery, with his friend Crotus from Erfurt, and entered himself at the University of Cologne, to the great indignation of his father, from whom he remained estranged for many years. From Cologne he passed in rapid succession to the Universities of Erfurt, Frankfurt-on-Oder, and Leipzig. At Erfurt he formed the friendship of Eoban Hesse, a youth of his own age, which lasted him through life, and became acquainted also with Mutian, who was several years older, and who, like many of his later associates, disliked his vehemence and irritability, while he sincerely admired his talents. Like most able men, Hutten first tried his hand at writing poetry, and at Erfurt he composed his "Elogy to Eoban," but poetry, though he often dabbled in it, was never his forte. From Leipzig he moved, at the age of twenty-one, to Greifswald, where he was for a time sheltered and then thrown over by Canon Lotz, a Professor in the University, and thence in the same year to Rostock, and soon afterwards to Olmütz, where the Bishop befriended him; and finally to Vienna, where at length he brought his varied and intermittent course of academical studies to a close, having already avenged himself, in two books of metrical *Querelen*, on the treachery, as he viewed it, of the Lotz family. It was soon after this that extreme necessity compelled him to enter the army, for his father, who had no sympathy with his intellectual tastes and disliked his erratic and useless life, as he considered it, still continued obdurate. But he found soon afterwards a powerful friend and patron in Albert of Brandenburg, Archbishop of Mayence, and it was only when, in the last years of his life, he had definitely committed himself to the Lutheran revolt against the whole existing order of the Church that the connexion between them was inevitably dissolved. At Mayence also, in 1514, he first became acquainted with Erasmus. For the events which next followed in Hutten's life, and especially for the tragical story of Duke Ulrich's murder of his cousin and its consequences, we must refer our readers to Strauss's graphic narrative. And so we are brought to the publication of the work on which his fame will always chiefly rest, the *Epistole Obscurorum Virorum*.

The reputation of Reuchlin, who had been violently attacked by the monastic party, was vindicated in a series of letters from distinguished "Humanists," afterwards collected under the title of *Epistole Clarorum Virorum*. And this seems to have suggested the idea of producing a fictitious correspondence on the part of his opponents, designed to illustrate their ignorance, coarseness, and stupidity. The first batch of forty letters, which appeared in 1515, when Hutten was in Italy, contained nothing of his; and the caricature was so skilfully effected that the Mendicant Friars in England supposed the work to be genuine, and hailed it as giving testimony in their favour against their enemy Reuchlin. Crotus, who afterwards took a decided part against the Reformation, is generally supposed to have been the principal author of this first series. The second part, comprising seventy more letters, appeared two years later, and this is by common consent attributed in the main to Hutten. The satire is of a kind which to us would seem ponderous, and often—to say the least—very coarse, but it attained its end. Luther, who had no appreciation of Humanism, thought the work impudent, and called the author a harlequin; while Crotus, who enjoyed his laugh at the Obscurantists, had no sympathy with the Reformer. Hutten had points of contact with both.

It was during the last four years of his life, between 1519 and 1523, that Hutten turned his attention to the religious aspects of the great conflict which was shaking society to its core. And while Humanism, or, as it is now usually termed, the Renaissance, may be said in one sense to have arisen from the same wave of thought which produced the Reformation, it must be remembered that the two movements were not only distinct in origin and character—for the Renaissance began a century earlier—but in some respects uncongenial and even antagonistic to each other. The Reformers were willing enough to join the Humanists in gibbeting the ignorance or vices of monks and popes, but popes had themselves been patrons and examples of culture, and Leo X., who condemned Luther, was an elegant scholar, though scarcely an ideal of Christian virtue. The two parties were related to each other somewhat as the Girondins and Jacobins of the French Revolution. To men like Crotus or Mutianus or even Reuchlin, whose real aspirations were for refined and learned leisure, and who cared little or nothing for theological controversies, as such, there was something positively repulsive in the fierce dogmatism of men like Luther and Calvin, which they regarded as no less unreasonable and more practically inconvenient than the dogmatism of their

Catholic opponents. Moreover, what religious belief they had themselves inclined more to the old dogmas than to the new. This was apparently the case with Mutianus, and certainly with Erasmus, who was so angrily and unjustly assailed by Hutten when he refused to follow him into the Protestant camp. Yet Erasmus was the most theological of the Humanists and the most classical of the theologians of his day, and was ready at first to go some way with Luther in a doctrinal as well as moral reformation of the existing system. But he soon perceived that "wherever Lutheranism prevailed there was an end to classical studies." Nor is there any reason to doubt the sincerity of his later denunciation of Luther's immoral and "paradoxical" doctrine of justification and free will, which found an ugly illustration in the Peasants' War, and has indeed been no less severely censured in our day by so grave and unimpassioned a writer as Hallam. Hutten alone of those who held a high place among the Humanists threw himself heart and soul, for the last few years of his life, into the cause of the Reformation. But no candid inquirer can fail to perceive—what was all along evident to Luther himself—that, even then, his sympathies with the movement were far more political than religious. The divine to whom one of his last letters was addressed, Nicholas Prugner, laments that on his deathbed he should still be appealing to *Fortuna*, and quoting the classics instead of the Bible. The simple fact was, as his biographer justly observes, that his thoughts had acquired a certain Christian and theological hue—say rather theological varnish—from his intercourse with the Lutheran party, which they lost again when he was alone and in misfortune; that is, exactly when religious sentiment which was more than skin-deep would have been most powerfully operative. He was agreed with Luther in desiring that Germany should be freed from foreign dominion and the Church from Roman influences; but the first was Hutten's main point, and the second Luther's. It is perfectly intelligible therefore that the Reformer should, as he complains with some bitterness, have received his advances rather coldly. There was no real sympathy of heart between them. It is natural that Strauss should dwell, in connexion with Hutten's change of front, on his beginning in 1520 to write in German—which however he never wrote well—instead of in Latin, in order to mark his appeal from the learned few to the great body of the nation. For it recalls the difference between the first edition of his own *Leben Jesu*, professedly addressed to scholars only, and the second, published thirty years afterwards, *für das Volk bearbeitet*, in which he appeals to the people, "as Paul turned to the Gentiles, when the Jews rejected him." Hutten even translated some of his earlier dialogues from Latin into German, while he continued to write new ones in Latin. From his biographer's sketch of one of the most effective of the latter, we take the following extract, which seems to illustrate his superficial and thoroughly untheological way of dealing with the Reformation controversy, even where it is his professed theme. In the *articulus stantis rei salutis Ecclesie*, which was all in all to Luther, he probably felt no interest at all, if indeed he ever troubled himself to inquire what it meant:—

In the first [i.e. the Dialogue called *Monitor Primus*] one, of the superior clergy, who has been a friend and follower of Luther, tells him why he and many others have resolved to part company with him. Besides fear of the Papal Bull, they were tired of Luther's teaching, which they had at first liked. They could not approve of reducing the Church from her present brilliant position to her original poverty and insignificance. On the contrary, Luther says, he was trying to purify the Church from human additions, to preserve her from secularization, to restore her original lustre by making divine truth and Christ's precepts the only rule of life. The Monitor then expatiates on the contrast between the early imperfect Church and the present triumphant one. But Luther rejoins that the Church can but be one for all times; if the Apostles held suffering wrongfully to be victory, it shows what their idea of triumph was. The duty of a Christian bishop was to feed his flock by preaching, example, and prayer. But Leo X. (of whose private life he would not speak) did not preach at all, and, instead of saving souls, had ruined many by his wars and indulgences. Such a shameless traffic and impudence as this ought to open his friend's eyes. As for the Papal bulls, the very name ought to be enough. The Papal decretals ought to be burnt and abolished by all Christian rulers as a collection of merely human dogmas. The Monitor will no longer listen to such dangerous talk, and maintains that safety is on the side of the Pope and the majority. The outward pomp of Christ's representative does Christ's honour, and he does not at all approve of Luther's dissuading people from making gifts to the Church. The demands made on people by the Papal party were less severe; they allowed you to take life easily; precepts that were hard to practise were lightened by the priests or ignored altogether; if you want to do anything wrong, the good father makes out that it is allowable, which he is sure Luther would never do. Most certainly not, replies Luther; as an upright man, he could never give permission to sin, and would not if he could. The other is quite content with the papal permission to do evil. If any one was to blame, it was the Pope, not he; and he trusts that the Pope will answer for him at the day of judgment. But according to Luther (as Hutten understood his doctrine), no man can live on the responsibility of another, and as every man must answer for himself, so he must act according to his own conscience, and not on the opinions of any other person. The Monitor appears to feel the hollowness of his views, but interested considerations prevail. The diminution of livings would oblige him to put down his horses and servants, and he was hoping to be rewarded for his devotion to the Papal Chair by a cardinal's hat.

The last few months of Hutten's life were spent in great poverty and suffering on the little island of Ufsan near Rapperschwyll at the eastern extremity of the Lake of Zürich. He was engaged at the time in a violent quarrel with Erasmus, in which neither of them can be pronounced free from blame, and seems to have owed what comfort and support he had in that trying period to the generous kindness of Zwinglius, who supplied him both with money and books. At the end of August or early in September 1523 he died, in his thirty-fifth year. We cannot say that Strauss has succeeded in winning our sympathy or respect for his personal

character, which was impetuous, domineering and singularly deficient in self-control. But his career has an interest of its own, historical and literary, which is unique; and the biography, now first presented in an English dress, is marked by all the clearness and vigour of style which distinguished the author as a theologian, and cannot fail to challenge the attention of a wide circle of readers to whom the *Leben Jesu* would be unintelligible or repulsive.

DAWKINS'S CAVE-HUNTING.*

AS an active member of the band of original explorers of British caves, Mr. Boyd Dawkins is especially qualified to sum up and to illustrate, as he has in his recent volume undertaken to do, the earliest chapters of the archaeology of man. The history of the Pleistocene mammalia, in which Palæolithic man forms the central figure, has for years formed the subject of his special studies, the results of which, embodied from time to time in contributions to various scientific periodicals, are here collected together, and brought into relation with the general evidences of geographical and climatic change over the continent of Europe. Like most compilations of this kind, the work comes before us in a somewhat disjointed state, and is disfigured by many repetitions. The writer himself disclaims any idea of presenting it as a detailed or finished history of cave exploration. It is in the more modest form of a faint outline of a new and vast area of research that he submits it to the verdict of the public. And the mass of information he has brought together, with the judicious use he has made of his materials, will be found to invest his book with much of new and singular value.

Cave-hunting on anything like a systematic scale in this country is to be laid to the credit of the late Dr. Buckland, whose researches in the natural hollows of the limestone quarry at Kirkdale, Yorkshire, in 1820, laid the foundations of the new science of cave exploration. Four years before this Mr. Whidbey's examination of the bone cave in the Devonian limestone at Oreston, near Plymouth, suggested by Sir Joseph Banks, had yielded remains identified by Sir Everard Home with those of the rhinoceros. As long ago as 1603 Gesner's *History of Animals* had amply discussed the fossil bones of the elephant or mastodon, known as unicorn's horn, and largely used for medical purposes, as well as those of the lion, hyæna, &c., from the caverns of the Hartz, and from those of Hungary and Franconia. What had been from time immemorial known as dragon's bones from the caves of the Carpathian ranges and elsewhere were shown by Cuvier to belong to the cave-bear. Towards the end of the last century explorations of this kind were carried on in Germany by Esper, Rosenmüller, and Goldfuss, the most important of them being those at Gailenreuth, in Franconia. The interest of these researches was at its height when the cave was visited in 1816 by Buckland, who acquired there that knowledge of cave-hunting which he turned shortly after to such good account in this country. His researches at Kirkdale supplied him with ample proof that the cave had been inhabited by hyænas, by whom the carcases of the rhinoceros, mammoth, stag, bison, and horse had been dragged in for food, their broken and gnawed bones strewing the floor. That those animals had lived in what is now Yorkshire in remote times was placed beyond doubt. But it was not for many years that the co-existence of man with this fauna of another epoch was established. As early as 1825 flint implements were met with by Rev. J. McEnery in Kent's Hole, Torquay, which he thought might be the handiwork of man of that age; but the scientific world, including Dr. Buckland himself, was not prepared to accept such evidences of man's antiquity, verified even as they were by the subsequent researches of Mr. Godwin Austin in 1840, and by those of the Torquay Natural History Society in 1846. These proofs were long held unworthy even of investigation. Though flint implements were accumulated by thousands, it was not till 1850 that the exploration of Brixham cave, under the supervision of Mr. Pengelly, disclosed the existence of such marks of man in association with the remains of the hyæna, woolly rhinoceros, and mammoth in undisturbed red loam as decisively proved man to have been living in that region at the same time as those animals. The discoveries of M. Boucher de Perthes in 1847 at Abbeville, and those of Rigollot at Amiens, were received with equal scepticism in France, until the visit of Dr. Falconer in 1858, in company with Mr. Prestwich and Mr. John Evans, resulted in his digging out with his own hands an implement from the undisturbed strata which finally disposed of the question. In the next year Mr. Boyd Dawkins entered, in association with the Rev. J. Williamson, upon the exploration of the hyæna den of Wookey Hole, near Wells, with the result of manifold and incontrovertible proofs of the contemporaneity of man with the extinct mammalia, and from that time to this he has carried on researches in caves in various parts of Great Britain. In 1869 it was his good fortune to light upon a group of sepulchral caves in Denbighshire, which he satisfied himself had been used by an Iberian or Basque race in the Neolithic era. A further class of evidences, combined with those yielded by the exploration of the Settle cave in Yorkshire, under Mr. Dawkins's advice, led him to the important conclusion that a series of caves extending over a wide area in the

centre and North of England was occupied by the Brit-Welsh in the interval which elapsed between the departure of the Roman legions and the English conquest. We have the testimony of Gildas to the fact of the caves in the Northern counties having afforded a refuge to the remnant of the Celtic inhabitants of Britain during the raids of the Picts and Scots. We have thus in one view the earliest and the latest stages of the habitation of natural earth dwellings by man in these islands.

From the history of cave exploration in Europe Mr. Dawkins proceeds to discuss the physical characteristics of caves; their formation by the action of water or of volcanic disturbances, and their relation to what are called "pot-holes," "cirques," and ravines, illustrating them by reference to the principal caverns in these islands. They are not generally found, he shows, in lines of faults, though they follow weak or soft lines in the deposition of strata. Wherever calcareous rocks, in particular, are sufficiently hard and compact to form a roof, there caves are to be found in greater or less abundance. They open for the most part on the abrupt sides of valleys and ravines at various levels, being arranged round the main axis of erosion in a way which our author likens to the arrangement of the branches round the trunk of a tree, as, for example, in Cheddar Pass. It is by the chemical action of the carbonic acid in the rain-water, and the mechanical friction of the sand and gravel set in motion by the water, that the formation of caves other than those hollowed out by the sea is to be explained. The limestone in which most of them occur, being composed in great part of pure carbonate of lime, is readily dissolved by the carbonic acid present in rain-water, having been taken up in the main from the decomposing vegetable matter which generally forms the surface soil on the limestone. Curious forms of honeycombed or acid-worn joints, like that from the Dove-holes, Derbyshire (Fig. 7.), testify to the force of this chemical agent. Those caverns which are now dry bear evidence of the same agency. Far from being the result of any subterranean convulsion—a theory amply disproved by the floor and roof of undisturbed rock which they display—they retain in their grooved, scratched, and polished surfaces marks of the mechanical action of the stones and sand carried along by water currents. To the same causes are due the ravines and valleys met with in limestone districts. A ravine was even termed by M. Desnoyers "caverne à ciel ouvert." Mr. Dawkins claims to have arrived independently at the same conclusion. The open valley, he says, passes insensibly into a ravine, and that into a cave. "The ravine is merely a cave which has lost its roof, and the valley is merely the result of the weathering of the sides of the ravine." It is the shelter afforded by caves that led to their becoming the haunt of animals and men, and hence the light they throw upon the history of life. Caves must have existed in all ages, and doubtless have had at all times their living denizens. Why then, it has to be asked, have we no traces of their tenancy by animals prior at least to the Pleistocene era? The Eocene palæotheres and anoplotheres must have met their death in the open pitfalls, just as the sheep and cattle do in our day. The hyænodon of the Miocene had probably the same cave-haunting tastes as his descendant the living hyæna, and the marsupials of the Miocene might as surely be preserved in caves as the fossil marsupials of Australia. The most reasonable explanation of the absence of such remains is that the ancient suites of caves and fissures which contained them, lying for the most part near the sea face of the rock, have been swept away by denudation in the course of the alterations of level which preceded the formation of the existing caves. The modes by which the filling up of caves has come to pass, by infiltration of deposits and the formation of stalagmite, are set forth by Mr. Dawkins by a fine series of examples, the most marked of which are the beautiful stalactitic deposit, from the Fairy Chamber in the Island of Caddy, opposite Tenby, and from the Black Rock Cave in the same neighbourhood; some of these singular varieties showing signs of having been moulded upon minute fungi, like those in the cave of Ingleborough. In some places the continuous drip results in the formation of small spheres of calcite, which become so beautifully polished by the friction of the agitated water as to be known by the name of cave pearls. Long stalactites forming a delicate canopy of tassels hang from the roof, forming as they grow downwards slender shafts no thicker than straws. Each of these is hollow, translucent, and more or less percolated by water. The calcareous drip ceaselessly running through them forms upon the crystalline pavement so many round bosses, either red or snowy white, which by degrees grow into shafts, and meet to form a continuous pillar from floor to roof. Mr. Dawkins dilates with enthusiasm upon the scene which met his eyes on penetrating the crystalline chamber of Caddy, the most beautiful cavern of this kind. As he broke his way into some of the unexplored recesses through the thickly planted strawshafts, and scene after scene of fairy beauty, unsullied by man, opened upon his eyes, the ringing of the fragments upon the crystalline floor at every movement he made caused him to feel like an intruder and sorry for the destruction. Experiments made by him in conjunction with Mr. James Farrar and Professor Phillips upon the rate of deposit or growth of stalagmite in the Ingleborough cave, given in detail in the appendix, lead to no general result, the conditions being to a great extent local only; the chief fact in the calculation is the ratio of carbonate of lime held in solution by the water. It seems probable that the stalagmites and stalactites in this case go no further back than the time of Edward III.

This cave contrasts strongly with others, like those at Settle

* Cave-hunting: Researches on the Evidence of Caves respecting the Early Inhabitants of Europe. By W. Boyd Dawkins, M.A., F.R.S., F.G.S., F.S.A., &c. Illustrated by Coloured Plate and Woodcuts. London: Macmillan & Co. 1874.

or Kirkdale, which carry us back to the primeval period of man's existence. Here, while well-known coins with Samian and other pottery met with near the surface furnish exact data as to their occupancy within the range of history, the disintegration of the lower strata has yielded evidences which enable our author to fill up a fairly complete and credible pedigree, if we may so say, of the cave to the Neolithic period at the least. The accumulation of angular fragments torn away from the cliff by the action of the water in the period between the Brit-Welsh occupation and the present time, extending over 1,200 years, is seen to amount to two feet or so. At this rate of weathering, the thickness of six feet of similar fragments between the Brit-Welsh deposit and the Neolithic strata beneath it would require a period thrice as long, or 3,600 years; and consequently the date of the earliest traceable occupation of the cave by man is approximately fixed at about 4,800 or 5,000 years ago. To an age far remote into the Palæolithic we may plausibly assign the man to whom belonged the fragment of a fibula disinterred in the stratum of grey clay many feet below this level, under the same mineral conditions as the rest of the Pleistocene bones of rhinoceros, reindeer, red-deer, bison, horse, and brown, grizzly, and great cave bears, dragged in thither and gnawed by the hyænas by which the cave was tenanted. Whether this primitive man was himself the prey of these voracious animals, or was one of a tribe who alternated with them as occupants of the cave, we have no means of judging. The fragment of bone has been pronounced by Professor Buxton an unusually massive human fibula by comparison with an abnormal specimen already in his possession. To the Neolithic date and race may be referred the human thigh-bone found in the small cave in King's Scar, two hundred yards distant, characterized by the great development of the muscular ridge known to anatomists as the *linea aspera*, denoting the peculiar flatness of shin which is termed by Mr. Buxton platycnemism, and which has been recognized in no other skeletons but those of the Neolithic age, as found in the tumuli of that period in Yorkshire, and in the caves and chambered tombs of Denbighshire, as well as in Neolithic deposits abroad. That this race is to be identified with the Basque or Iberian stock, and that from it are descended the small dark peoples of Derbyshire, Wales, and certain parts of Ireland, with more numerous and wider-spread descendants upon French, Belgian, and Spanish soil, is ably argued by Mr. Dawkins upon grounds of evidence resting upon anatomical measurement and delineation of the skulls and other remains, the vestiges of habits and workmanship, and what is to be gleaned from historical notices. His ethnological map, showing the distribution of these non-Aryan races, together with that of the Celtic and Belgic peoples at the dawn of history, receives confirmation from its correspondence with that of M. Broca, which did not come into the hands of Mr. Dawkins before his own map had been engraved. If, as we have remarked on a former occasion, Mr. Dawkins fails to appreciate the philological difficulties in the way of some of his conclusions, there is no doubt that, from his own special point of view, there is much to be said in support of his theory. A second map represents the physiography of Great Britain late in the Pleistocene age, prior to its depression by one hundred fathoms or thereabouts, distinguishing the area of land now submerged, the region inhabited by animals, and that occupied by glaciers. The great rivers are shown which, after traversing Europe from a remote parallel of latitude in the South, probably debouched at a point now far out under the German Ocean. We could have wished to see a line given which might have allowed this mighty subtropical stream to bring down the hippopotamus, whose remains have been found near Leeds. That the second, if not the first, great glacial sheet followed this tenancy of the land by the Pleistocene fauna is beyond much doubt. Nor can it well be questioned that man, as a contemporary with that fauna, witnessed the breaking up, and it may even be the gathering, of that ice-sheet. If England has failed to yield proof equally decisive, there is the unmistakable witness of the mammoth of Aquitaine, etched from life by an artist who must have been familiar with an animal extinct long before the range of European history. There is, however, evidence of a secondary or indirect kind, hardly less conclusive, as to the fact of the lower strata of the Kirkdale and Victoria caves, with their embedded Pleistocene remains, having been pre-glacial. And as a consequence the fragment of human bone found in the latter cave amongst such remains goes far towards establishing the truth that man lived in Yorkshire before the great Ice epoch. Had no other result than this attended the enterprise of cave-hunting, our toilers in this new department would no doubt have deemed themselves abundantly rewarded. But, reduced as it now has been to a science in itself, and stimulated by the zeal and ability of men like Mr. Dawkins, there is no saying what amount of new and valuable discoveries their labour may have in store for us.

THROUGH NORMANDY.*

THIS account of a tour "Through Normandy" possesses the great charm of being written in a cheerful spirit. Unlike many travellers and authors who have nothing but complaints and sneers for the districts through which they have journeyed, Mrs. Macquoid appears to have thoroughly enjoyed her holiday, to have

appreciated the scenery, the towns, and the people of Normandy as they deserve, and to be filled with an overflowing desire to send all her readers thither to enjoy themselves in like manner. Though there is really nothing very new or striking in her book, it leaves a bright and pleasant impression upon the mind; and while those who already know Normandy will recognize the truth of her descriptions, and sympathize with her in her enthusiasm, those who are yet in ignorance of its attractions may be stirred by Mrs. Macquoid's advocacy to the amendment of their education:—

In comparison with the travellers who go eastward and southward on their autumn holiday, very few stop to visit the picturesque old towns and charming scenery of the ancient and beautiful province so closely linked with English sympathies, so nearly resembling some of the loveliest landscape districts of England. . . . We can go to Normandy any day, and so the day is deferred, and we live on in ignorance of some of the most interesting and picturesque towns, and some of the most exquisite river-scenery in Europe—for Normandy possesses all the charms of our green Devonshire and Kentish landscapes, with the addition of being much better watered.

There is so much worth visiting in every part of the country, and it offers such a variety of interest in its world-famous cities, its churches, cathedrals, and old buildings, so closely linked to the history and domestic life of our Norman and Plantagenet kings; its lovely wooded valleys and castle-crowned hills; its silver-grey rivers, winding round lofty cotes, sometimes chalky, sometimes half clothed with graceful beech or birch trees, or taking a straighter course through bright green meadows and orchards full of fruit-jewelled trees; its charming villages, where the vines cluster round the windows and climb even to the many-coloured thatched roof above, that one wonders at the absence of English travellers, in out-of-the-way nooks and corners.

To the other merits of Normandy may be added that it is no exertion to travel there. Of course there are vigorous people to whom this fact is no recommendation. The devotees of Alpine passes and mountains look down upon the unadventurous souls who only go to France, as De Wilton, after his severe course of pilgrimaging in Arabia, Palestine, and other outlandish places, might have looked down upon the easy-going folk who contented themselves with the pious recreation of a ride to the shrine of St. Thomas of Canterbury. But for the modern representatives of the Canterbury pilgrims—for people who have no love for climbing, or for getting up early in the morning, or for toiling in any other manner over their pleasure—Normandy is a very pleasant land. There is enough to see in the towns, and not too much; the distances from place to place are short and easy, and though the trains, as in other French provinces, are not remarkable for speed, at any rate the slow pace and the long halts give the intelligent traveller better opportunities for observing the features of the country and the manners of the natives. One of the few complaints Mrs. Macquoid permits herself to make is against railway unpunctuality; but, after all, though French trains may not be exemplary, we do not know that English trains in these days have much to boast of in that respect. The chief difference is that the French are late in a slow, deliberate, placid way, which makes you feel how much time you are losing; whereas the English are late in a hurried scrambling fashion which leaves one no room for reflection. Then Normandy, albeit far from commonplace, and possessing a marked individuality, is sufficiently civilized to afford the traveller good lodging and good fare—base considerations perhaps, but which nevertheless go a long way towards the enjoyment of a tour. Mrs. Macquoid has an eye to the practical as well as to the poetical, and does not confine herself to the antiquities and scenery of the country she has passed through. Her book is intended to be of real use as a guide to the towns best worth visiting, and accordingly she sketches out for her readers a line of route, with suggestions as to the means of locomotion, and gives them distances and prices, and, in some cases, the names of the hotels to be preferred; upon which last subject, by the way, we can fully join with her in her praise of the Hôtel de France at Rouen.

As a literary performance, the book is strongest in descriptions of the scenery and the people of the province. Little incidents of travel, trivial dialogues with cicerones, drivers, farmers, or peasant folk, are touched with the practised hand of the novelist, but yet with an air of reality. "Word-painting," of which we have here a great deal, always labours under the disadvantage that, unlike the art to which it is metaphorically likened, it has little meaning to any but those who already know the subject of description. All the talk in the world about green-grey stones, and deep blue seas, and tender purple mists, and loose fleecy clouds, and lights and shades, does not really convey any distinct idea to those who have never looked on the scene which the writer is striving to bring before them; but, on the other hand, it may call up pleasant pictures before the mind's eye of those who have the requisite experience. And Mrs. Macquoid's descriptions are executed with skill, full of artistic feeling, and not running to unreasonable length. There is, it must be admitted, next to nothing in these pretty descriptions and trifling incidents, but that nothing is pleasantly told. Her book has the further advantage of being illustrated by numerous drawings by Mr. Macquoid. They have the air of genuine sketches, and like genuine sketches, sometimes rather want pictorial interest. For example, three bunches of beans drying under the eaves hardly make a picture worth putting into a book. But when Mr. Macquoid has something that deserves to be called a subject, he generally treats it well, and many of the illustrations might be mentioned with praise. Perhaps among the best are some street scenes in Caudebec and a view of the Church of St. Jean near Avranches, in which there is a very good effect of evening light. On the other hand, the views of Dieppe Castle and of Mont St. Michel strike us as unsuccessful, particularly the latter, in which there is too much church

* *Through Normandy*. By Katharine S. Macquoid. Illustrated by Thomas R. Macquoid. London: Isbister & Co. 1874.

and too little mount. Of course, without standing on the actual spot from whence the sketch was taken, it is impossible to say positively that Mont St. Michel may not in some position look like the illustration before us, but this is at any rate not a characteristic representation of it. To return to the text, a description of the market women at Dieppe will bear quotation, partly as a specimen of Mrs. Macquoid's style, and partly for the sake of the criticism it contains upon pictorial peasants, who are often as unreal as their counterparts of the stage. We presume she refers to English artists who, perhaps to console themselves for the lack of picturesqueness in the agricultural population at home, insist on arraying their foreign peasants in impossibly fine new clothes. Continental painters are generally content with the sober hues of reality:—

We go from the Grande Rue to the Place Royale, or Place du Marché. It is market-day, and there is a most picturesque array of countrywomen, who look as if they all belonged to the sea, they are so coarse and hard-featured. Their dress is wonderfully full of low-toned colour, with perhaps bright-coloured cotton handkerchiefs tied over their heads, and blue and one or two black and scarlet striped skirts. One wonders where painters have seen the gaudy hues in which they sometimes depict Norman peasant-women. Black, dark blue, and a sort of greenish grey are almost the universal colours seen in skirts all over the province; the aprons black, grey, lilac, or blue. In La Haute Normandie the short loose jacket is worn by all, and this is always of black or dark grey stuff. The colour lies in the aprons, or where a bright-coloured square of cotton is tied over the cap. In La Basse Normandie, specially in Calvados and La Manche, where the neckerchief is still worn across the shoulders in place of the jacket, this is usually bright-coloured scarlet or orange mingled with black. The "indiennes" they wear for this purpose cost often 5s. or 6s., and are treasured for years, and worn only on market-days and festivals; but a scarlet petticoat is not often seen. The Normans are much too thrifty to wear any but dark-coloured gowns, unless indeed it be a lavender cotton, and this is always of a pale, subdued tint. It is the wonderful neatness and jauntness which pervade the whole costume of even the poorest, from the black wooden sabots to the snowy *bonnet de coton*, with its tassel a little on one side, that make the Norman peasant so admirably suited as contrast and relief to the quaint rickety wooden houses and mouldering grey stone wonders of past times, among which she lives, the colours of her dress always in harmony with the surroundings; and the men with their blue blouses and trousers, often faded to greenish hues, with many patches of the same colour, but of different tint, are just as harmonious objects as the women are. Their skins, too, warm as if the sun had burned his own reflection into them, their vivacious intelligent eyes and ready smile, and the intensely brightening effect of the pure atmosphere, make them quite salient enough against the ancient, sombre backgrounds of these picturesque old towns—the artist need not dress them up in colours which their natural sense of the fitness of things would repudiate.

When, however, we are told that the Norman peasant-woman's instinctive "feeling for fitness of colour" displays itself not only in her dress, but in the manner in which she piles up her fruit and vegetables on a market day, and that "it is pitiful, in the way of taste, to visit Covent Garden when we come home, and picture to ourselves the effect which a handful of Norman peasants would have produced with such a wealth of material," we feel rather disposed to smile at the enthusiasm of the author. The darkness and dinginess of Covent Garden, contrasted with that "pure atmosphere" which, as Mrs. Macquoid has herself remarked, has such an "intensely brightening effect," is, we suspect, the true cause of the difference, rather than any special faculty which the Norman woman possesses for setting off "golden carrots"—an inappropriate epithet, by the way, good French carrots being of a brilliant orange-red—with "snowy turnips," and "the rich crimson of cabbages and radish," and so forth. Mrs. Macquoid moreover is evidently of an enthusiastic nature, as is shown, for instance, when she denies that the drawing of the figures of the Bayeux Tapestry is, as Mrs. Stothard asserts, "rude and barbarous." No admiration for King William or for Queen Matilda, supposing her to have been the artist, could bring us to think that the drawing of the wooden horses and disjointed warriors of the Tapestry was highly executed and civilized; and all that Mrs. Macquoid can find to say in its behalf is that "it may be incorrect, but it is full of spirit," as if spirit and rudeness were not perfectly compatible. William the Conqueror himself—we mean the real man, not his counterfeit presentment in the Tapestry—receives almost awe-stricken admiration from our author. "We had been living so long," she tells us, "in an atmosphere of 'Guillaume le Conquerant,' as the Normans call him, we had visited so many of the places made famous by his exploits, that he had become, especially in his own city of Caen, a hero to us, and we approached the scene of his birth with both enthusiasm and reverence." Hero-worship in moderation may be tolerated, but still we protest against Mrs. Macquoid preparing her readers for "an atmosphere of 'Guillaume le Conquerant,'" whatever that may be, and a visit to Falaise, by filling eight pages with a character of the hero extracted from the *History of the Norman Conquest*. It would surely have been enough for her to direct intending visitors to Falaise to prepare themselves by reading the *Norman Conquest*, without lengthening out her own book in this paste-and-scissors fashion. Not content with this, she proceeds to give another extract on the same subject—happily a much briefer one—re-translated from "a French translation of an old English chronicle," and remarks, "It is curious to read this pendant to Mr. Freeman's opinion." To us it seems more curious that she should apparently know only through the medium of a French translation one of the most often quoted, not to say hackneyed, bits of the *Chronicles*—the famous passage summing up William's good and evil qualities, how wise and rich he was, how "stark" and stiff, and how "he loved the high deer as though he were their father." It is still more curious that she should not have discovered that her

extract from the *Norman Conquest* is in part founded on this very passage. While visitors to Falaise are made to enter into a needlessly deep analysis of the character of the mighty Duke, those who go to Dieppe are told nothing about the local hero whose statue stands in the market-place, beyond his name and the bare statement that he was "a famous sailor of Dieppe." Duquesne no doubt was a much smaller man than William the Conqueror; but still he is worth knowing about, and as he is not, like the Norman Duke, to be found in every history-book, readers and tourists would probably have received some information about him with more gratitude. In the account of Arques and its battle, the author quotes undoubtingly the lively epistle said to have been written by Henry IV. to Crillon:—"Hang thyself, brave Crillon, for we have fought Arques without thee." At Falaise Mrs. Macquoid owns to feeling "indignation against the wise disturbers of the beliefs of a lifetime," who deny that Duke William was born in the present Castle, and refuse to believe in the window out of which Robert saw Arlette washing linen in the beck. We fear that it will be equally distressing to her to learn that Mr. Hayward asserts that Henry's real letter to "brave Crillon" is of a later date than the affair at Arques, and that the version to be found in the notes to the *Henriade*, which is the one she gives, is almost as much an improvement upon the letter quoted by Mr. Hayward as the famous "Tout est perdu fors l'honneur" is upon Francis I.'s genuine letter to his mother.

Of local legends and myths, which are always acceptable in a guide-book, if only because they may serve somewhat to beguile the dreariness of a wet day in an hotel, Mrs. Macquoid gives a fair number, most of which will probably be new to her readers. We extract the tale of the fairy of Argouges because, though the legend is in various forms common enough, there is a certain ingenuity and observation of everyday life in the device by which, in this version, the mortal man and his fairy bride are severed:—

The château [of Argouges] is very picturesque, with its quaintly shaped towers and its mount still full of water. One of the rooms is called "the chamber of the Lady," and there is still a tradition that sometimes the famous "fée d'Argouges" appears dressed in a white and shining robe, hovering about her ancient abode. . . . Robert d'Argouges had wooed a beautiful fairy, who became his wife; she warned him, however, that if he ever spoke of death in her presence she should be obliged to leave him. One day he was going to take a ride with her, and she was so long getting ready that he lost patience, and forgot her words.

"Belle dame," he called from the foot of the stairs, "thou wouldst be a good messenger to send in search of death, for thou wouldst take so long on the journey."

There came in answer one long despairing wail, and the fairy disappeared. It is said that, when she has been seen she cries out, "Death, death!" just before she fades out of sight.

Whether the legend-maker intended to point the moral that wives should not spend too much time over the putting on of apparel, or that husbands should refrain from sarcastic remarks, does not appear. We should like also to give the fine, though rather awful, legend of Odo Rignault, Archbishop of Rouen, and his covetous desire for the King's castle of Gaillon; but it is too long for quotation, and we must therefore leave our readers to find it for themselves in Mrs. Macquoid's book, where it is told with great effect.

QUEENIE.*

IF good wine needs no bush, does a scrubby branch necessarily symbolize a bad brew? Taking our stand on the proverbial Foot of Hercules and the Brick from Babylon, is it absurd to look for a satisfactory delivery when the sample is amiss? or is it that names are not expressive of the reality of things, and that a bad beginning may make a good ending? There are always these two ways of looking at matters, but the experience of mankind is mostly on the side that pronounces on the temple from the brick, and judges of the worth of the whole by the value of the sample. Applying this rule to the work in hand, the very title, *Queenie*, presages weakness and sentimentality. We know something of where we are when we have to do with a young lady whom all her friends conspire to call by a certain pet name, not naturally and by mere habit, but with that silly simper of intentional appropriateness which makes each reiteration a label and an offence. We know that we have to part company with life as it is, and with all that sweetness which comes from true simplicity and unconsciousness, when we get into such society as this. Our heroine is sure to be eaten through and through with affectation. She is for ever attitudinizing before a mental looking-glass, and always deprecating, now the admiration of her friends, and now her own virtues. If she tells her own story, as Queenie does, she is even more offensive, letting the reader know that she is beautiful, charming, admired, amiable, and so forth, with a mock appearance of simplicity which is both irritating and unnatural; never confessing her charms with the frank avowal of an honest girl who knows her own value yet is not spoiled by the knowledge, nor yet letting them be inferred by such artistic treatment of her subject as would carry grace and loveliness as a necessary sequence. This, then, we should say, is the initial fault of *Queenie*, the intense affectation and pretentiousness of the heroine in her very assumption of modesty and simplicity.

A second fault is the want of clearness and concentration of purpose in the characters, whereby we are always more or less in a haze as to their feelings, and groping blindly after their motives. The treatment is what artists call woolly, and the outlines are not for the most part sufficiently distinct. And where

* *Queenie*. A Novel. 3 vols. London: Hurst & Blackett. 1874.

there is an attempt to make them specially distinct, where there has been some amount of stippling bestowed, then the result is disastrous, as in the case of Nellie Demeric, the birdlike, port, and unpleasant little person—called Jenny Wren for love—who is, however, meant to be a bright and sparkling kind of pocket Venus, playful rather than impudent, and amusing but not ridiculous. We have no special love for the “long and lazy” Captain Kingston—“Beauty,” as he is called by his friends—who is one of the most insufferable fops that ever developed into a decent fellow at the end of all things; but we scarcely know that he deserved so severe a punishment as that of having this impudent and underbred little lady fastened to him for life.

Nor, though we highly approve of young ladies understanding the art and mystery of cooking, and hold that “floury hands” and “sleeves rolled up above the elbow” have a value of their own in no sense despicable, do we think it desirable that young officers should be allowed to stray from the drawing-room into the kitchen for the purpose of surprising the young ladies at their cake-making. And if they did so far transgress such ordinary rules of good breeding as would obtain in a tradesman’s house, we should certainly not think the girls who presented one of them with a mass of butter to beat up, and another with an apron to tie under his chin and a bowl of eggs to “whisk,” exactly the nicest things of their sort to be found by diligent search. We cannot understand how even a printer’s reader could let such a silly and vulgar scene as this in the kitchen pass unchallenged; or in what school of conventionalism, or unconventionalism, the author of *Queenie* can have graduated to imagine a social absurdity so monstrous possible in any circumstances whatever. The whole of the chapter ought to be omitted. It is a farrago of silliness and vulgarity throughout; beginning with the slightly ill-natured episode of sister Sophia’s essay, the reading of which is somewhat marred by the presence of little Davie, young enough to be pinched on his “scarlet legs,” to call bother “boser,” thing “sing,” and to play at making a nest and laying eggs in a tree, but old enough to wink with his left eye and to say to his sister Queenie, “Ha! ha! my lady! Then, next time, do you leave a fellow’s culves alone”; going on to this impossible scene in the kitchen, where two young officers, scarcely known, come down to surprise the young ladies of the house, and are received as Dickens would not have made even *Jemima Evans* receive her accepted young man; and ending in the all but acknowledged love of Queenie and Harvey Graham on what cannot have been more than the fourth time of meeting. But this is perhaps not to be wondered at, seeing that on the first introduction he squeezes her hand when he wishes her good-night, in consequence of which she falls a deep “with feelings of pleasure for what the day had brought forth, mixed with doubtful self-dissatisfaction, yet shy gladness”; on the second she shows her jealousy of a young married woman, and “the corners of her mouth droop” as she sees him carried off by this “man-eater” to a safe distance; while on the third they shake hands over their compact to be always “friends”—which means lovers—and he tells her that his sisters don’t care “a rap” for him, and that he is poor, which makes “a cold white mist” to seem “to creep up from the horizon of her mind, hiding out and veiling the gay, golden pinnacles of an airy castle, which was never built in her imagination and yet was there.”

We nowhere see the effects of the redundancy of women more strikingly than in certain novels. The facility with which the heroines fall in love, and the frankness of their self-surrender, is simply amazing to people whose ideal of maidenhood includes pride, and with whom reticence is one of the sweetest feminine charms. Here is Queenie, a tall girl with grey eyes, and a certain assumption of self-control as a quality to be encouraged and made much of, down at the feet of Harvey Graham on a first interview. And she has not even the poor excuse of tenacity to redeem her haste and make her sudden passion respectable in the retrospect. She falls in love with Harvey Graham, but she falls in love also with Dudley Wyverne, and is so confused and uncertain in her feelings that, when Dudley makes loves to her, she cannot say which she likes the better of the two, but only wishes that she had seen him first. We do not say that this is not human nature. We dare say it is—human nature of emphatically a very common type—but it is not what we expect from a heroine with the suggestive name of Queenie, one who might have been presumed at least to have known her own mind so much as to be able to say which man it was she loved and which of the two she desired to marry.

If Harvey Graham is only a blue-eyed, honest-hearted, sweet-voiced man, Dudley Wyverne is all this in his own way and something more. His guns are of heavier intellectual metal than his friend’s; very heavy metal indeed when he does “blaze away,” as coarse-natured Uncle Alick calls it. Once the conversation drifts into the very depths of speculation, when Dudley asserts that all animals will have another existence to compensate them for the misery they undergo through man’s sin in this. But when he is pinned to the example of mites in cheese, he makes, we think, a scarcely honest retreat by saying, “Oh! their creation is the effect of civilization. In our future state I should imagine no cheese, no mites.” We extract Queenie Demeric’s answer, premising, however, that this is not the way in which the young lady usually talks, and that her bold dive into deep waters comes upon us therefore with a sense of strain and incongruity by no means advantageous to the artistic merit of the book:—

“If you admit that any form of animal life has had its distinct origin since the creation, you open a door at once to the supposition that there may also

have been several, instead of one single, great primal centre of creation.” I rejoin, in perplexity, transfixing him sternly with my grey eyes. “And since fossils show marks of disease and death ages before man’s creation, why should later animals alone be recompensed?”

As the conversation proceeds, we come upon the following playful badinage, which we give as a specimen of the humour and descriptive powers of the author:—

“Women always are so fearful of stepping out of the beaten track in these matters,” remarks Sophy.

“Might get into a quagmire,” interrupts the audacious Dudley. “They distrust their own powers—and quite rightly too.”

“While men are overweeningly self-confident,” I retort, “and ‘fools rush in where women fear to tread.’”

“Oh! angels, angels. You may have the full benefit of the quotation,” exclaim all the male sex in full cry, with the most impertinently patronizing tone.

“What an uncomfortable idea of future happiness you all seem to entertain,” observes Gerald Forbes, like Agag, delicately. He is seated stiffly upon his pocket-handkerchief, with outstretched legs, and an air of extreme discomfort—this useful article being so placed to protect his nether garments from chance injury, and his own precious person from any possible harm arising from the damp of his lately wave-washed seat. “Be off, animal!” he exclaims, all of a sudden, with such force that we all start. “Dog, may you never be resurrected!” he continues rapidly, addressing Shot, the old red setter, who is comfortably scratching and shaking himself on a rock beside our much distressed friend; or, if you are, at least come alone, and don’t—don’t, I beseech of you, invite any of your small friends on a visit.” Here his vehement utterance drops into one of painful entreaty, as he struggles with apparent exertion to remove himself from his uncomfortable position.

Among the characteristics of style to which we would take exception, we find, in the first place, an unnecessary amount of current slang; in the second, a habit of calling names not of a choice or complimentary description. One worthy says, “He has got some brains in his head, not mere drawing-room balderdash, like those other two grinning nincompoops,” which may be middle-class English, but is not Parliamentary. August, too, as “synonymous (*sic*) with grouse,” may be a correct tabulation of men’s thoughts, but we think we have a right to object to the spelling, and to ask that writers shall not make their own dictionaries. A gentleman making love spitefully rather than tenderly, comparing his fair enslaver to “Ninon de l’Enclos, who could love truly for two months, which to her was an age,” “a sneer spoiling his handsome face” as he speaks, while the lady, who is no other than Queenie herself, thus bandying doubtful phrases with Dudley Wyverne, “flashes back a look as disdainful as his own,” and gives as her “mocking answer, delivered with all the cool raillery she can muster,

‘Le plus souvent, le plus souvent,
Je ne suis pas pour le sentiment,’”

seems to us to make a scene more than questionable on the score of true refinement. Also an officer asking a lady if she does not think a certain race “rather a rotten affair?” and further confiding to her that when he “saw Ida coming to the front he rushed down and shot a book-maker for a pony,” answering her bewildered look with “Oh! you’re not up to the dodge,” with more to the same purpose, are surely strange words for the ordinary English gentleman to use when addressing the ordinary English gentlewoman. But we are quite ready to admit that novelists have possession of a class of creatures not to be found out of their pages, and that what would be outrageous in a real drawing-room passes muster readily in a fictitious one.

As for the story of *Queenie*, nothing can well be thinner. It is simply the history of how a girl falls in love with one man at one time and with another man at another time, heedless of the good old adage about being off with the old love before being on with the new; how the first man dies so that the course may be left clear for the second, and how we are to suppose that the marriage did really take place “to-morrow,” hoping that Dudley never afterwards reproached his Queenie with that episode of Harvey Graham, but, knowing what men are, afraid that he would do so when bilious and cross. We cannot but think that it must have taken up a good deal of time which might have been better employed, and that it must have cost a sum of money for which it might have been possible to find better uses, to write all this in three volumes, and, having written it, to present it printed to the public.

MINOR NOTICES.

AT this sombre season the thoughts of many persons turn with instinctive longing to the bright skies and sunny warmth of the South, and there is a general flight thither from motives of pleasure, or too often of sad necessity. It would be difficult to find a more useful or agreeable companion on such an expedition, whether undertaken in reality or in fancy, than Dr. Bennet’s book*, which in the course of successive editions has grown from a little essay into a respectable volume embodying the experience of fifteen winters and springs passed on the shores of the Mediterranean. Dr. Bennet writes not merely as a doctor, but as a traveller and man of the world, and his scientific observations are varied by picturesque glimpses of the country and the people as he moves about. Gratitude compels him to give the palm to Mentone above all other sanitary stations, for its delightful climate restored him to health at a very critical time, and he always feels better there than anywhere else. He still adheres to his opinion that there is no better winter climate than that of the more shel-

* *Winter and Spring on the Shores of the Mediterranean.* By J. H. Bennet, M.D. London: J. & A. Churchill.

tered regions of the Western Riviera, but his personal preference need not be accepted as an absolute dogma, and he takes care to give an equally full account of the other resorts of invalids. He finds that there are two kinds of winter climate in the Mediterranean; one mild and dry, on its north shores generally, and more especially the Western Genoese Riviera, and the East coast of Spain; and the other, mild and moist, on the West and South. Palermo, though its mean winter temperature is higher by some degrees than that of the Riviera, is pronounced to be rather moist and relaxing. In Algeria also, though the winter nights are warmer than on the Northern coast of the Mediterranean, and the summer heat intense, there is more rain and more atmospheric moisture. Of course where invalids are concerned other considerations besides those of climate must be seriously considered. It is necessary that they should be provided with the sort of accommodation which is essential to their requirements, and in this respect the older and more matured settlements have naturally an important advantage. The expense of living at Mentone has quite doubled since Dr. Bennet first went there, and is now as high as at Nice or Cannes. The reason of this is, however, that the markets are now much better supplied and the standard of living more luxurious. On the other hand, Corsica, though described as a most enjoyable and fascinating country, is still somewhat backward in regard to comfort. The condition of Ajaccio, however, seems to be improving, and those who go there get at least as good a climate—it is of the same mild, moist kind—as that of Algeria, without having to go so far for it. Dr. Bennet, we observe, has a good word to say for Biarritz, the character of which is perhaps scarcely understood. Persons who visit it in the glare of summer naturally find the heat oppressive, but during the winter the atmosphere is very agreeable, and the place has then also the further recommendation of being comparatively cheap. Biarritz, from its exposed situation, is obviously not suited for cases of severe disease; but there must, Dr. Bennet thinks, be many cases in which the sunshine and mild temperature of the South-Western coast of France may be sufficient. At Arcachon the pine woods of course add to the beauty of the scene, and supply a more sheltered situation.

We have seldom met with so vivid and interesting a picture of a settler's life in a wild country as that which Mr. Kennaway has given us in this little volume.* He has not attempted to write a connected narrative, but has just jotted down remarkable incidents and experiences in a plain, business-like way, without any effort at literary effect, if we except some snatches of verse with which he cheered his solitude. Perhaps the highest praise that can be bestowed on the work is to say that it often reminds us of *Robinson Crusoe* by its graphic simplicity of detail. Indeed Mr. Kennaway would seem to have a good deal of the character of the famous explorer in his own composition. It must not be supposed that *Crusta* is full of terrible and exciting adventures. The writer and his brother went out in 1851 to the Middle Island of New Zealand to try their fortune in sheep-farming, in which they appear to have been very successful; and their solitary and laborious life, the shifts they were put to, and the hardships they had to undergo, their reverses and triumphs, are told in a plain, straightforward, and unpretending manner. There is no attempt to disguise the hard prose of colonial existence, or to invest sheep-driving with an air of romantic interest. We are made to feel the weariness and monotony of the life, its coarse drudgery, and incessant anxieties; and at the same time we catch the spirit of the settlers, and can understand the sense of satisfaction and even exhilaration which goes with such sturdy, earnest work. What is involved in driving a flock of a thousand sheep for three weeks across a broken and unknown country may be gathered from the chapter entitled "On the Road." Colonial sheep, we have to be reminded, are not as English sheep. Though tolerably well bred, they are half wild, unmanageable animals, accustomed to roam over great tracts of open country, allowing no one to approach them within half a mile, and breaking away at full gallop, and trying the mettle of good dogs to head them. And these are the sort of animals which have to be got somehow or other over steep hills, through long stretches of plains, and across foaming torrents. A case is mentioned in which three days were spent in trying to get three hundred sheep across a rapid river, the two shepherds in charge having finally to carry the sheep over bodily in pairs, on horseback. On one occasion the author's party had their hut burnt and nearly all their provisions destroyed while camping out with sheep, and, while the rest went off for fresh stores, he and a companion had to pass forty-six days on the spot by themselves, sleeping on the ground in bitter winter weather, in hail, frost, and snow, with short rations of bread, weak tea, and mutton, and all the while distracted by the perverse wanderings of the sheep. Towards the end of this time even the flour and tea failed, and they had to drink a nauseous concoction from the twigs of a small shrub, manuka, to wash down the scraps of frozen mutton, firewood being also very scarce. Perhaps the most stirring passage in the book is the description of "Fire against Fire." The parched grass of the neighbouring country had caught fire, and the wave of flame could be seen rapidly rolling towards their sheep-runs. The only chance of escape was to cut off the fire by burning off a belt of grass between two rivers, which, however, involved the risk of their own fire getting beyond their control among the jungle, and devouring the flocks it was intended to protect. The attempt, however, was successful. This

* *Crusta: a Settler's Fare 'dus South*, By Laurence J. Kennaway. London: Sampson Low & Co.

and other incidents of sheep-farming and sheep-driving, together with long exploring rides, are described in a simple, animated way that brings the kind of life distinctly before us. It should be added that Mr. Kennaway gives a cheerful account of the present condition of the part of New Zealand with which he is best acquainted.

Mr. Blair, who is an Executive Engineer in the Indian Public Works Department, is anxious that people in this country should clearly understand the very serious and complicated difficulties which surround the problem of dealing with Indian famines.* These disastrous events, as he points out, are not mere exceptional and isolated phenomena. The causes which bring them about are always more or less actively in operation; and it is consequently necessary to take especial care that, in providing a remedy for the evils of the moment, nothing is done to sow the seed of worse evils in the future. Mr. Blair gives a brief and useful review of the great famines which have at different times occurred in India, and also some statistical tables, in which the results are exhibited in a distinct and impressive form. His general conclusion is that while direct relief to the starving people during a famine is indispensable, the great object should be to push on preventive works, so that the necessity for direct relief may be gradually diminished—a conclusion which, though not particularly original, is none the less sound. Mr. Blair makes one remark which certainly deserves attention, and that is that there is an obvious danger in trusting to the operation of the laws of political economy in a country where the customs and prejudices of the people tend to neutralize or counteract them.

Mr. Eassie has reprinted from the *British Medical Journal* a series of papers† which present a very clear and concise view of the chief sanitary requirements of a wholesome dwelling. The work, we are told, is intended for the use of officers of health, architects, builders, and householders. It need hardly be said, however, that it will not enable a householder to dispense with professional assistance, and to take upon himself the direction of the operations which may be necessary to set his house to rights. Its chief use as far as the householder is concerned will be to make him supremely uncomfortable, and to impress upon him a melancholy sense of his own utter helplessness. It will teach him that mysterious and unseen dangers lurk on every side; that, for anything he knows, the drainage of his house may be so contrived as to poison the air and taint the water, that pipes and traps and cisterns are all conspiring against the health and lives of his family, and that scamped walls and rotten foundations are also doing their part to generate damp and fever. What can an ordinary householder know about the hidden arrangements of his house? As a rule, he takes them on trust, on the assurance of the landlord or builder that everything is all right, and learns only by sad experience the perils to which he is exposed. Such works as Mr. Eassie's will at least do good service in creating an active and resolute public opinion on the subject. The only way in which householders can protect themselves is by insisting on the production of detailed plans, and getting them checked by a competent professional person; but before people will take this trouble they must be thoroughly alarmed.

The frog has suffered so much in the interests of science that it is only fair that science should make some return to the frog. Accordingly, in an interesting little treatise‡, Mr. St. George Mivart exalts the common frog as one of the most wonderful of animals; and so undoubtedly it is, since, beginning existence with the organization of a fish, it undergoes a remarkable metamorphosis and becomes an air-breathing quadruped, capable of easy and rapid movement over the ground. The structure of man himself may almost be said to be simple and commonplace compared with that of the frog, which presents relationships of analogy or affinity to very different animals, such as fishes, serpents, tortoises, and crocodiles, as well as to the human system. Mr. Mivart is therefore justified in saying that there is probably no other existing animal which is so replete with scientific interest of the highest kind. Mr. Mivart's views on the various biological problems which are incidentally presented in the course of this study may be anticipated from the side he has already taken on such questions. He suggests that if new forms of life, new species, arise from time to time through congenital variations, such forms may have arisen through the evolutions of implanted potentialities definite in nature, or, in other words, by "specific genesis." The illustrations of this little volume are profuse and excellent.

Mr. Kaufmann's *Socialism* § is in more ways than one an unsatisfactory work. In the first place it is impossible to know how far it is his own composition and how far it is borrowed from the German work by Dr. Schaffle on which it is honestly enough acknowledged on the title-page to be founded. It is described in the preface as "a popularized epitome" of the latter, "with additions and alterations to adapt it for English readers," but, as the "additions and alterations" are not specified, there is a constant uncertainty as to what is Mr.

* *Indian Famines; their Historical, Financial, and other Aspects*. By Charles Blair. London: Blackwood & Sons.

§ *Socialism: its Nature, its Dangers, and its Remedies Considered*. By the Rev. M. Kaufmann, B.A. Founded on the German work "Kapitalismus und Socialismus." By Dr. A. E. F. Schaffle. London: Henry S. King & Co.

Kaufmann's and what is Dr. Schaffle's. Unfortunately, too, the process of adaptation for English readers does not include translation into smooth and intelligible English. The work is disfigured by the absurd bastard jargon of "Continental charlatans and fanatics." We read of "conglutinated labour," "capitalism," "individualism," "mercantilists," "solidarity," "economic federalism." And what is to be said of such a sentence as this:—"You have not yet been able to point to a modern positive socialism which would under a system of oecumenical commerce dispense altogether with capitalism." A conspicuous weakness in the book is the extravagant importance attached to the wild rhapsodies of the Lassalles and Marxes; but it must not be supposed that their opinions are adopted. The general tone in which the rights of property are discussed is sensible enough. The result of a tiresome examination of a great amount of wordy rubbish is to establish in the main the familiar conventional conclusions. It is a relief at last to find that "the way to a true social reform does not lead over the ruins of existing capitalism."

Mr. Richard Lewis, the Secretary of the Royal National Lifeboat Institution, has compiled from the ample materials at his command an interesting and useful history* of the lifeboat and of the measures which have been taken to extend its use along our coasts. It is a curious circumstance that the first lifeboat should have been invented by a landsman who had always lived away from the sea, and had had no personal experience of the perils against which he was anxious to provide a safeguard. This was Lionel Lukin, a native of Dunmow, and afterwards a coach-builder in Long Acre. The buoyancy of his boat was secured by a projecting gunwale of cork which was added to its upper frame, and a hollow, water-tight compartment at the bottom of the boat. The design was patented in 1755, but attracted little attention. Four years afterwards a ship was wrecked at the mouth of the Tyne in the presence of thousands of people, who saw the crew drop off one by one from the rigging, and yet were unable to afford them any assistance from the want of a boat that could live on such a rough sea. This distressing spectacle naturally made a deep impression, and it was resolved to offer premiums for the best model of a lifeboat. Mr. Greathhead, a local boat-builder, won the prize with a boat the keel of which was curved instead of straight, and which was made buoyant with cork. She had no means of freeing herself of water or of self-righting if upset. Greathhead's boat rendered useful service, and he was rewarded by a Parliamentary grant of £1,200, but somehow the interest in lifeboats languished. Even when the subject was taken up by the National Lifeboat Institute, which was established in 1824, the stimulus which was then applied had only a temporary effect, and for many years lifeboat work was carried on in a very feeble and fitful way in consequence of the want of funds. The late Duke of Northumberland seems to have inspired new life into the Institution, and its recent history has been one of great activity and success. Along the seaboard of England and Wales, 2,000 miles in extent, the Institution has now 181 lifeboats; on the Scotch coast, 1,500 miles, 30 boats; and on the Irish coast, 1,400 miles, 31 boats. Great improvements have also been made in the character of the boats, in regard to self-discharge of water, stability, self-righting, and so on. Only a small minority of the Institution's boats do not possess the quality of self-righting. Mr. Lewis discusses the question of the practicability of using steam in lifeboats, but fears that the difficulties are insurmountable. A lifeboat has often to be conveyed over a flat shore, covered with heavy surf, forming perhaps a continuous mass of broken water for a mile or so from shore, and in deeper water it is liable to extremely violent motion, being sometimes thrown into an almost vertical position. Under these circumstances, it would be scarcely possible to afford sufficient protection to the fire of the steam-engine to prevent it from being extinguished, while at the same time preserving the necessary draught of air and convenient access to the fire by the engineer. Mr. Lewis's conclusion is that an open boat with stout oars is the safest form that can be adopted. His work, it should be mentioned, is illustrated with woodcuts of a superior character and diagrams.

Mr. Zeller† was one of Strauss's pupils, lived for several years under the same roof with him, and afterwards kept up an intimacy with him to the time of his death. He has also had the opportunity of examining his friend's correspondence and private records of his life. From these materials he apparently intends to write a complete life of Strauss. The present volume is offered, not as "a finished picture, but as a preliminary sketch"; and it is, in fact, chiefly devoted to an analysis of Strauss's published works. The information which it affords as to his personal history and character is rather meagre and disappointing; but perhaps there was little in the external circumstances of the philosopher to excite interest. His father was a retail shopkeeper, with a taste for mysticism and poetry, who neglected his business, and was often rather rude to his customers. The mother was a shrewd, cheerful, practical woman, and strongly inclined to rationalism on religious subjects; and the son took chiefly after his mother. One of his earliest teachers was Professor Baur, the founder of the Tübingen School, who exercised a deep and permanent influence on his mind. It appears also that he passed through the school of Schleiermacher before he found his centre of gravity in that of Hegel. After distinguishing himself at the University, Strauss was appointed

deputy to a country minister not far from his native town, Ludwigsburg. He is said to have been popular as a preacher, but in a very short time he was recalled to academical duties. Soon, however, he discontinued this kind of work too, in order to devote himself to his "Life of Jesus." It was published in 1835, and in a few years passed through numerous editions. This success led Strauss to devote himself henceforth exclusively to literature. Indeed the feelings excited by his during book rendered it hopeless for him to expect official employment. Even the free-thinking Government of Zürich, which in 1839 offered him the Professorship of Theology, was obliged by the excitement which was produced to cancel the appointment. At this period his outward appearance corresponded but little with the conception which most of his readers probably formed of him. The delicate lines of his youthful countenance, the slight bend of the head, and the contemplative downcast eye gave, we are told, an impression of almost girlish shyness. In 1848 Strauss was elected a member of the Würtemberg Diet, but soon found himself in conflict with popular views, and the attacks of the Radicals compelled him to resign. "If," he said, "I have only to choose between the despotism of the prince and that of the masses, I am unhesitatingly in favour of the former." Strauss was married in 1842 to a well-known singer and actress, by whom he had two children; but the marriage did not turn out happily, and a separation took place at the end of five years.

It appears from the preface to the "Romance of Acadia" * that during the enforced leisure which he himself was accustomed to call his "twilight," Mr. Charles Knight amused himself by collecting materials for a tale founded on the early history of Nova Scotia. He only went so far, however, as to sketch out the plot and the principal characters; and two members of his family, a daughter and grand-daughter, have now endeavoured to fill in the outlines and complete the narrative. A composition of this kind could scarcely be satisfactory, and it is evident that its publication has been dictated rather by love than discretion. It is impossible to imagine a more shadowy and uninteresting tale.

Mr. Quaritch's Catalogue † may be justly described as the great book of the season; indeed its only rival in greatness is the *Post Office Directory*. It contains some two thousand pages of closely printed matter, with a careful index; and, apart from the immediate purpose for which it is issued, it has a permanent value as a work of reference.

Mr. James Greenwood presents himself once more in the character of "one whose delight it is to do his humble endeavour towards exposing and extirpating social abuses and those hole-and-corner evils which afflict society." The *Wilder of London* is a reprint of articles which have appeared in various newspapers, and which Mr. Greenwood thinks have not received "the amount of consideration" which they deserved. As the account of the mysterious man-and-dog fight is not reproduced in this collection, it may be presumed that the author thinks it has already secured adequate attention. It is a pity, however, that it was not added in order to complete the book. The reader would then have had before him the natural climax of that highly artificial style of writing, persistent practice in which at last makes it impossible for the writer to distinguish in his own compositions between fact and fiction. In the present volume there is a paper called "At the Turnspit, Quaker's Alley," which may be regarded as a first sketch of the subject which was afterwards so powerfully developed by Mr. Greenwood's brooding imagination.

The reproduction of Lord Lytton's work on "England and the English" § is chiefly interesting, not so much for the light which it throws on the state of England at the time when it was written, as for the illustration it gives of the youthful opinions of the writer. The book was originally published in 1833, when the author was Mr. Bulwer, and a romantic and impetuous advocate of popular rights. He resented the haughtiness and exclusiveness of the aristocracy, and he was equally repelled by the vulgar coarseness of the mercantile middle class. In the masses alone he discovered real generosity and openness of mind, and he looked to their influence as a wholesome check on the corruptions of the State. It is significant, however, that Radical sentiment did not stand in the way of what were practically very Conservative conclusions. For instance, though the people are to have a large power in electing the Government, this is on the assumed condition that the Government is to be in advance of the people, and to pass laws for them, not to receive all law from them. Again, despicable and mischievous as the aristocracy may be, it is to be regarded as an unavoidable evil, which, if suppressed in one form, would be sure to spring up again in another, and the House of Lords is, therefore, to be left standing. On the whole, Mr. Bulwer's political criticisms strike one as rather crude and capricious, although there is undoubtedly a good deal of common sense mingled with epigram and paradox. The literary style of the book is loose and verbose, and the capital letters are grotesquely profuse. "Art," we are assured, "is the result of inquiry into the Beautiful, Science into that of the True," and the artist is warned that he must "image forth something beyond the Visible and Diurnal." The sketches of character which are interspersed

indicate satirical force; but, on the whole, it can hardly be wondered at that people did not discover from such a work that the writer was a great genius, or that in his lifetime it should have fallen into an oblivion from which he prudently abstained from rescuing it. Whether it was worth while to reprint it now may reasonably be doubted.

Many of those who are already familiar with Blake's poems will welcome a new edition*, and others will be glad of an opportunity of making acquaintance with them. Whatever may be thought as to Blake's sanity—and there can be no doubt that he had at least the taint of occasional madness—it is impossible not to admire the daring yet delicate imagination, the exquisite freshness and simplicity of expression, and the tender sympathy which mark his poems. Some of the pieces in this collection are published for the first time, and Mr. Rossetti's preface gives a minute account of Blake's personal history.

PROVINCE of ONTARIO.—CANADA MUNICIPAL BONDS.

FOR SALE, Debentures of Counties, Towns, and other Municipalities in the Province of Ontario, Dominion of Canada, at prices yielding between Six and Seven per Cent. Interest, and payable in sterling in London.

These Debts, which have all been incurred in aid of Railways and other public works, constitute in each case a first mortgage charge on the respective municipal revenues and assets. These revenues are ample in every case, and to the extent required by the obligations are administered for the Debenture-holders by the Province, which also guarantees the Holder's title.

The Debentures fall due over a term from December 31, 1880, to August 31, 1883. The price ranges from £100 for those of 1880, to £44 for the longest term, 1883. Of the total of £264,400, those falling due in 1880 amount to £219,400. The Interest is due half-yearly, on June 30 and December 31.

The Terms of Purchase are Ten per Cent. on application, and the balance on allotment and delivery of the Bonds.

The price are not at accrued Interest, which purchasers have to pay up from June 30 last.

All further particulars will be given on application at the Office of the Agents for the Province of Ontario.

COLONIAL TRUSTS CORPORATION, LIMITED.

31 Palmerston Buildings, Old Broad Street, London.

Deposits and other Payments are to be made to their Bankers, Messrs. GILF, MILLS, CURRIE, & CO., Lombard Street.

William Edwards, Esq.

Sir Walter Charles James, Bart.
Richard Twining, Esq.
John Walter, Esq., M.P.

The EQUITABLE is the oldest Life Office on the Mutual System in the world.

It has never allowed Commission or employed Agents.

By non-payment of the ordinary minimum Commission of 5 per Cent., more than TWO MILLIONS STERLING have been saved to the Policy-holders.

FINANCIAL POSITION.

Present Cash Assets more than	£1,000,000
Present Annual Income more than	350,000
Whole Working Expenses	7,500

All Policies taken out this year (1874) will participate in the next Division of Profits, which will take place on January 1, 1880.

The returns to the Board of Trade show that the aggregate working expenses of all the Life Offices in the United Kingdom give an average (including Commission, where paid) of more than 94 per Cent. on the sum of their gross incomes.

The whole Working Expenses of the EQUITABLE average about 21 per Cent. on its Annual Income.

J. W. STEPHENSON, Secretary.

LAW LIFE ASSURANCE SOCIETY, Fleet Street, London.

Invested assets on December 31, 1873	£3,467,714
Income for the past year	307,284
Amount paid on death to December last	9,850,739

Forms of proposal, &c., will be sent on application at the Office.

THE LONDON CO-OPERATIVE WINE ASSOCIATION, LIMITED.

STORES: 446 Strand opposite Charing Cross Railway Station.

The Association was established in October 1873 for the purpose of providing a Co-operative Store devoted exclusively to the supply of Mixed Spirits and Liqueurs, where there should be given that personal attention to the tastes and wants of customers which had hitherto been found only in the best conducted private establishments.

The Management is in the hands of a gentleman who retired from partnership in an old-established firm of wine merchants in order to undertake his present post, and who bestows the same attention upon the tastes of purchasers as can be done in a private business.

The Advantages of Co-operation are not unknown, but the reasons why a Co-operative Wine Store can compete favourably with old-established firms of wine merchants are less understood. They are—

1. The practice prevails of sending out travellers, who receive salary, commission, and travelling expenses, and also of giving a commission of from five to ten per cent. to salesmen (often gentlemen of good social position), all which must fall on the purchaser.

2. In a private business the loss from bad debts is heavy, whereas in a Co-operative Store payment is made before the purchaser takes possession, and there is absolutely no risk of loss on this score.

3. This prior payment provides to the Store an increasing working capital as the turnover increases; whereas every trader knows that, as his business grows, more and more capital is absorbed by his book debts, and a larger capital is needed. The goods are sold at a Store, and are never paid for until they are sold. In the ordinary course of trade the wholesale dealer receives payment and therefore the occasion of business provides its own needed capital.

4. The annual payment of 5s. for a ticket, although not felt in the wallet, amounts in the aggregate to as large a sum as to contribute substantially towards the payment of rent, salaries, &c. The Governing Council elects the Directors and the Public elects the members to purchase from the Association on the same terms as to prices and discounts as shareholders.

All Max Gieger's Hungarian Wines may be obtained by Ticket Holders at the Stores at 10 per cent. discount off list prices to the public.

Annual Tickets, 5s.

Tickets now issuing available till December 31, 1875.

Applications for Tickets, giving name in full, address, and usual signature, must be accompanied by a remittance for the amount of Ticket.

For Price Lists address JOHN GIER, Secretary.

Stores, 446 Strand, W.C.

THROAT IRRITATION.—The Throat and Windpipe are

especially liable to inflammation, causing soreness and dryness, tickling and irritation, including Cough and affecting the Voice. For these symptoms use Glycerine in the form of Lozenges. Glycerine in these agreeable combinations, being in proximity to the glands at the moment they are excited by the act of speaking, becomes actively healing. Packets 6d. and 1s. by post. Right of Red Seal and Pink Label. "JAMES EPES & CO., Homoeopathic Dispensary, 48 Threadneedle Street, and 170 Piccadilly."

WORMS in a TOY TERRIER.—"21 East View, Preston, Oct. 30, 1872.—I administered one-third of a 'MILBURN'S POWDER' to my toy terrier, and within half-an-hour he passed a good many worms, some upwards of a foot long."

By post, Right of Red Seal and Pink Label. "JAMES EPES & CO., Homoeopathic Dispensary, 48 Threadneedle Street, and 170 Piccadilly."

MR. DISRAELI AND GERMANY.

AS might have been expected, the German press considered itself entitled to find fault with Mr. DISRAELI's speech at Guildhall. It seemed as if the English PRIME MINISTER had made a very unnecessary and a very unfavourable reference to the conduct of the German Government in the ARNIM business; and it must be owned that, had Mr. DISRAELI done this, he would have fairly laid himself open to criticism. It seemed impossible to understand to what he could be referring, if not to Count ARNIM and his imprisonment, when he talked of arrests and domiciliary visits, to which in some foreign countries noblemen were exposed; and the German Government itself probably shared the opinion that it was being talked against sufficiently to inquire what Mr. DISRAELI had said and had meant to say. Mr. DISRAELI at once took frankly and heartily the most sensible line. He gave it to be understood once for all through a special communication to the *Times*, that he did not mean to refer in any way to the German Government, that his remarks had nothing to do with Count ARNIM, and that in what he said about arrests and domiciliary visits he had only before his mind the generally deplorable condition of all the Continental nobility. Of course the German Government, and Germans generally, have nothing to do but to accept this explanation and let the matter drop. It is not for them to look a gift horse in the mouth. But our French friends are not inclined to let off so easily either Mr. DISRAELI or England. They will have it that this disclaimer was only the polite and official manner of owning that a mistake had been made, and of correcting this mistake. Mr. DISRAELI, these French critics say, evidently did mean to use the boasted liberty of a Briton, and to denounce the tyranny of BISMARCK. Standing in Guildhall, and, as Mr. JOHN LEMOINNE expressly points out, having GOG and MAGOG to back him, he defied Germany, and said what he pleased. But after the fust came the reckoning. The great BISMARCK was angry and let it be known he was angry, and instantly Mr. DISRAELI's valour collapsed. He made what, although veiled in diplomatic language, amounted to a humble apology. He had to eat his words, and to own that the living BISMARCK was superior to the dead idol of Guildhall. This drives Paris wild with delight. Here is Albion, which once was as proud as it was perfidious, literally humbled in the dust. England, like the rest of the world, kotoos to the man of blood and iron. He holds up the rod, and she kisses it; he nods, and she trembles. This is not merely to reduce England to the present low level of France, although even that would have been a pleasant spectacle. It puts England far below France. The French Foreign Office is avowedly afraid of BISMARCK, and Duke DE CAMBRES would no more dare to refer in a public speech to Count ARNIM's arrest than a Danish or an Austrian Minister would dare. But then France at least fought hard against holding her present position. She has been brought to accept it by the sword and by famine. England, on the contrary, has never dared to strike a blow. Big words are enough to frighten her, and her PRIME MINISTER yields at discretion to the orders of Berlin. Do not you feel heartily ashamed of yourselves, you English? asks Mr. LEMOINNE. Does not your Gog bow down and your Magog stoop? Are you not burning with regret and mortification? and do you not in your hearts envy the gallant French, who at least did not cry out till they were hit? Such are the questions which, with their usual ingenuity, our French friends put to us;

and our only answer is, that although we are sorry to disappoint them, we must confess that we have no sense of shame whatever, that we are perfectly comfortable, and that, so far as we can see, GOG and MAGOG look exactly as they did a fortnight ago.

We will assume, merely for the purposes of argument, that the French are right in saying that Mr. DISRAELI's disclaimer is only a roundabout way of expressing a regret that he should have used indiscreet language. Let us suppose that he did make a mistake, that he subsequently saw his mistake, and took this method of correcting it. This is what Parisian journalists say really happened. They put the case at the worst, and this is the worst at which they put it. We may be quite content to meet them on their own ground, and on this ground the very different ways in which Englishmen and Frenchmen would view the matter are curiously striking. We have here none of the French susceptibility as to owning ourselves wrong. We do not think the very least the worse of ourselves for admitting that we have been mistaken. We even sometimes appear to enjoy the luxury of our own woe, and find a subtle pleasure in traversing the abysses of penitence. Probably no nation, having any pretence to greatness, ever ate so much dirt as we swallowed while the *Alabama* Arbitration business was going on; but we only smiled as we stuffed our mouths with mud, and stuttered out "Mi Yankee, non angit." If Mr. DISRAELI was wrong, we like him to say that he was wrong. Our pride in frankly confessing our faults fully equals the pride of the French in stoutly denying theirs. If Mr. DISRAELI had meant to refer to Count ARNIM, the German Government would have been quite right in resenting his indiscretion. This is enough for us. Our side was wrong, their side was right. We acknowledge this, and there is an end of the matter. The Parisians do not condescend to go into details of this kind. It is idle in their eyes to inquire whether what was supposed to have been said was the right thing to say. It had been said, and men of honour always stick to what they say. If they did not, may be the secret thought of the Parisian mind, what would become of duelling? It is these paltry explanations that play the very mischief with a quarrel. If a gentleman before he raps out his sword stops to inquire whether the language he may have happened to use is justifiable, what is the use of his being a gentleman and having a sword to rap out? From what may be termed the DUGALD DALGETTY point of view this reasoning is certainly very cogent; but those who care more for getting through the business of life satisfactorily than for the laws of the duello may comfort themselves by observing that to own a mistake, when made, not only seems somehow more right than to brazen it out, but greatly conduces to the commodious transaction of affairs. Some day, perhaps, we shall be anxious to obtain explanations from the German Government. It will do something, or say something, or threaten something, that we should like to understand a little more clearly. If such a case arises, we shall at least now be able to feel that we start fair, that we are only asking to be done by as we have done, and that we can discuss the topic in which we shall then be interested on the basis of its being recognized that to give proper explanations, to recede from false positions, and to repair indiscretions carries with it no necessary humiliation.

If there is anything in our way of looking at such a matter which will astonish our French critics, they might

be still more astonished if they could be brought to understand that such an indiscretion as that which they assume Mr. DISRAELI to have made and owned would not injure him in any way in English opinion. He would be thought just as much of after it as before. His opponents would naturally make what little gain they could out of a trifle. They would point out that when he was in Opposition he was always making capital out of the indiscreet utterances of Liberals, and protesting that it was the first business of a statesman to measure his language; and they would be elated to find that he too could blunder when his time of office came. But they would not really think that they injured him, or that he had injured himself. He would be just as much above every man in his party as he had been. It is only of very eminent men that this can be said, but it can be said with perfect certainty of them. There never was a people that stuck to its men of the first rank with so much fidelity as the English do, and this national characteristic is one of the strongest incentives to exertion and rewards of merit which statesmen can have to animate and satisfy them. There are some men in each generation who, while constantly and keenly criticized, seem to have risen above criticism. They belong not only to Parliament and to their party, but to the nation, and the nation will not give them up. In the days of the greatest glories and successes of the GLADSTONE Ministry, when the Conservatives were crushed and powerless, and every one was warming himself by the blaze of some burning question, no one was so cheered whenever he appeared in public as Mr. DISRAELI. Now that the tables are turned, whatever Mr. GLADSTONE may do, whether he stays in Wales or comes to London, whether he moves resolutions or abandons them, whether he writes on Ritualists as if they were a quaint savage tribe whose customs he had not had time to understand before he sailed away, or whether he writes a pamphlet to show that he has found out what it would have been just as easy for him to have found out four years ago—he is equally the great, the glorious, the indispensable GLADSTONE. There are probably not ten men in all Flintshire who, when Mr. GLADSTONE cuts down a tree, would not like to be allowed to carry off a chip in their waistcoat pocket. If Mr. GLADSTONE made a speech in the House consisting of fifty lines from the First Iliad, and Mr. DISRAELI replied with fifty verses from the Lamentations of JEREMIAH, each would be thought to have spoken well in his own rather peculiar style. The *Times* would explain that they were both “artists,” and every one would be satisfied. This may be an odd state of things in the eyes of foreigners; but it is one which they should strive to realize and comprehend if they wish to understand England. They might find something exaggerated, something perhaps even childish, in the feeling which English statesmen of the first rank awaken in Englishmen; but they could scarcely come to the end of their meditations without arriving at the conclusion that it is in a great measure owing to the existence of this feeling that England possesses the peculiar type of statesmen of which it is most proud.

MR. GLADSTONE AND THE LIBERAL PARTY.

NOTWITHSTANDING the differences of opinion by which the Liberal party is at present divided, all sections are happily unanimous on one point of primary and immediate importance. Sir HENRY JAMES, Mr. LEATHAM, Mr. RICHARD, and Mr. FAWCETT agree that, for the promotion of the various or opposite public objects in which they are severally interested, it is indispensable to retain Mr. GLADSTONE as leader. Mr. CHAMBERLAIN indeed significantly remarked that Mr. GLADSTONE had earned a right to repose, if he chose to claim it, as the reward of his labours; but all members of Parliament who have lately addressed Liberal meetings insist, with more complimentary earnestness, on the continuance of Mr. GLADSTONE's services. Mr. RICHARD went out of his way to explain some incidental reasons for avoiding a change in the leadership of the party. It had been, he said, a pitiable spectacle to see the occupants of the front Opposition bench contending with one another for the allegiance of followers who regarded them all with distrust and indifference. On one occasion during the Indian campaign of 1857, when Sir COLIN CAMPBELL extricated a part of his forces from an embarrassing situation, it was observed that the cheer which greeted his arrival at the scene of

action was a vote of want of confidence in the commanding officer whom he superseded. In the same manner Mr. RICHARD's enthusiastic belief in Mr. GLADSTONE is partly intended as a censure on the colleagues who endeavour to represent him in his absence. There can be no doubt that the best argument for retaining a competent functionary is that it is difficult or impossible to replace him. It would be unfair both to Mr. GLADSTONE and to his enlogists to attribute their repeated offers of adhesion exclusively to negative causes. Fidelity and loyalty are among the best of political virtues; and it would be discreditable to those who shared and applauded Mr. GLADSTONE's triumphs to desert him in his temporary adversity. Whether he is in office or in opposition, it is evident that he cannot promote both the policy of Sir H. JAMES and the policy of Mr. LEATHAM; but either section of his followers may hope that he will take a longer or shorter time to think thrice before he denounces the institutions which they respectively cherish and dislike. The expectations of the advanced Liberals are more plausible, and they are probably more sincere, than the confidence of their unfriendly allies. It is scarcely probable that Mr. GLADSTONE will during the remainder of his political career sustain the part of PALMERSTON, who seldom defended an obstinate prejudice, and never permitted an organic change. His successor in the lead of the Liberal party is by a necessity of his own nature always deeply in earnest, and profoundly convinced of the importance of the measures which he may happen to advocate at the moment. It is difficult to feel violent excitement in the prospect of letting well alone. The human race has not been regenerated by the causes and motives which have hitherto operated; and perhaps the millennium may be attained by electoral districts, by subdivision of land, or by the abolition of the Established Church. Subversive politicians, when they express confidence in Mr. GLADSTONE, imply their disbelief in his permanent adhesion to any of his former convictions.

Although Mr. GLADSTONE in the early part of the last Session intimated a doubt whether he should hold his position after the present year, it may be conjectured that he has no intention of an abdication which would be premature and unnecessary. Whatever may be thought of his defects, he has no competitor in his party. It is evident that his interest in public affairs is unabated, for he is still prone to commit the error of intervening too frequently in political conflicts. Private friendship rather excused than justified his unnecessary interference in the late election at Wenlock. There was no entanglement which required to be removed by a superior power descending from the exalted regions in which Prime Ministers dwell. Some time since, Mr. DISRAELI, then in opposition, made a similar mistake with reference to a Bath election, and the result was not encouraging to statesmen who are tempted to be officious in petty matters. It is difficult to judge whether Mr. GLADSTONE's activity in another department of controversy is suggested by political or ecclesiastical motives. His Essay on Ritualism, though it contained no reference to the real principle in dispute, was still more remotely connected with politics than with theology; but his pamphlet on the policy of the Vatican purported to relate exclusively to the civil allegiance of Roman Catholics. Mr. RICHARD and one or two other Nonconformists have since expressed their approval of declarations which seem to alienate Mr. GLADSTONE from Roman Catholic sympathies. More careful and more impartial critics have not failed to observe that Mr. GLADSTONE either intrudes into an alien controversy or identifies himself to some extent with one of the disputants. In any case it was not the business of a great leader of a party to prove that any section of his countrymen ought to renounce either their theological belief or their civil allegiance. Politicians in general look at such questions rather from the point of view of a Parliamentary Whip than as students of canon law or of ecclesiastical history. When they inquire into the probable consequences of Mr. GLADSTONE's publication, they will not fail to apprehend that the quarrel which he has gratuitously fastened on the Roman Catholic clergy may hereafter not improbably impede his return to office. The Irish members, who are for the moment comparatively powerless in the House of Commons, are likely to form an indispensable part of a revived Liberal majority. As far as they are compelled to consult the prejudices of the priests, they will probably refuse their support to the assailant of the infallible Pope. Fortunately

for Mr. GLADSTONE, Mr. DISRAELI also has lately thought fit to assume the character of a Protestant champion; but the Irish hierarchy will justly calculate that the PRIME MINISTER is more open to a possible negotiation than his serious and conscientious adversary. If the pamphlet on the Vatican Decrees permanently deprives Mr. GLADSTONE of the votes of twenty Irish members, it will have done more harm to the Liberal party than to the Ultramontanists. There can be little doubt that, if he had consulted his followers, they would have deprecated the publication of the pamphlet.

It is well known that the Moderate Liberals, though they prudently profess confidence in Mr. GLADSTONE, have no desire to accelerate his return to office. They are perfectly aware that for some time to come their party must be in a minority, unless it should profit by some unforeseen popular excitement, of which they would themselves disapprove. In the occasional contests which have occurred since the general election there has hitherto been no sign of a reaction against the Conservative movement. Even the expression by the Scotch University students of their political preferences, though in itself unimportant, is probably a reflection of the prevailing opinion of the middle classes. Mr. DISRAELI and Lord DERBY are preferred to their opponents because the Government of which they are principal members is for the present popular. Liberal members in their addresses to their constituents either confine themselves to barren criticism on the details of business in the last Session, or expound, in the spirit of Mr. CHAMBERLAIN and Mr. LEATHAM, doctrines which may perhaps be adopted by the country in the distant future. When they invite the patronage of Mr. GLADSTONE for democratic or revolutionary projects, they justify to the utmost of their power the impression which produced the overthrow of his Government. There is no reason to suppose that the constituencies are better inclined at the end of the year than they were at the beginning to tolerate a policy of recklessness and disturbance. Mr. GLADSTONE will not at present be recalled to power merely for the purpose of making all classes anxious, and all interests insecure. If Mr. GLADSTONE possessed either the steadiness of PEEL or the solid common sense of PALMERSTON, he would receive a large share of the support which is now unwillingly accorded to Mr. DISRAELI. If the prevailing opinion is Conservative, it is also Liberal, and it only inclines to the party now in office as the alternative of the supremacy of an extreme faction. In his unseasonable letter to the unsuccessful candidate for Wenlock Mr. GLADSTONE expounded with sufficient accuracy the true creed of a Liberal party which would both correct abuses and respect existing institutions. He would be more fully trusted if he were not claimed as a leader by those who would spare no existing institution. It is true that he has not yet declared his conversion to revolutionary theories, but there can be no doubt that the violent faction have plausible grounds for a confidence which is founded, not on his professions, but on his temperament and on his recent history. Old-fashioned Liberals, on the other hand, hope to exercise a certain control over the leader of a party which can only be saved from disruption by prudence and moderation. If Mr. GLADSTONE were to retire from the House of Commons, or from his responsible position as leader, the Radicals would provide for themselves a successor more easily than the representatives of the former Whigs. In the meantime allies who are in principle irreconcilably hostile to one another have sufficient reasons for loyalty to the only leader who may perhaps prolong for a time their artificial union.

THE PROSPECTS OF BONAPARTISM.

THE change which has come over the prospects of the Imperialist party is the most striking feature in French politics. It is all the more striking because scarcely any part of it is attributable to the action of the Imperialists themselves. The stars in their course have fought for Bonapartism. The mistakes of its enemies and the progress of events have alike helped it. And now the difficulties which beset the establishment of the Republic are leading men to ask whether, after all, the restoration of the Empire would not be the best thing that could happen; whether France has not more to gain and less to lose by this settlement than by any other; whether the Empire, under the new conditions under which it would be tried, does not promise to secure the essentials of good govern-

ment with less risk of failure than the Republic; whether, in short, wise and patriotic Frenchmen ought not to ally themselves with the Bonapartists in the hope of guiding and purifying them, instead of, as hitherto, offering an opposition which has its origin in nothing better than prejudice—prejudice no doubt founded on experience, but which fails to make due allowance for the qualifications which experience needs when it comes to be applied to the future. The main consideration on which this reasoning rests is the absence of any necessary connexion between Imperialism and that band of adventurers who founded and worked the Second Empire. It is admitted that if the Court of NAPOLEON IV. were to be a mere reproduction of his father's, an Imperialist restoration would not count among the alternatives between which good men have to make their choice. But the services of the men who constituted and gave character to the Court of NAPOLEON III. will not, it is said, be indispensable, or even helpful, to his successor. NAPOLEON IV. will be able to choose his supporters from among honest men, and when he is seen to do so, many of the stern politicians who now suspect the Imperial system will be willing to take part in working it. They will be the more disposed to do this because the special danger of Bonapartism is less formidable than the special danger of Republicanism. The Empire may be corrupt, but the Republic is very likely to lead to anarchy, and corruption is at all events more easily controlled than anarchy. If the Empire can be kept decently pure—and with the adventurers weeded out there is no reason why this should not be managed—it will secure order better than the Republic, and it will give Frenchmen as much liberty as they care to have. In fact, it will be very like a superior edition of the Septennate—the Septennate, that is, organized and made perpetual, and having a NAPOLEON instead of a MACMAHON at its head. In this last comparison, it is said, lies another reason why moderate and reasonable Frenchmen are likely to favour the Empire. The present Government, with all its faults, has kept things going with fair success, and if it continues to do this for six years more, the country will have got so well used to personal government that the accession of a BONAPARTE will seem the most natural thing to follow.

With the assumption which underlies this reasoning we entirely agree. Forms of government are things indifferent, provided that the substance of good government is assured. France may be free, tranquil, and prosperous alike under an Empire, a Republic, or a Constitutional Monarchy. The question at any given moment is under which form, all things considered, she is most likely to enjoy these advantages. The great fault of French politicians has been their inability to believe this. They have wished for the right things, but they have refused to believe that they could attain them except in one particular way. The moderate Republican and the Orleanist have had their separate formulas, and they have clung to them, not because they stand for different ideas, but because each has refused to see that the other's formula and his own can stand for the same ideas. Now any change of government is open to the objection that it tends to perpetuate this exclusiveness. France is in name a Republic. If she once more becomes an Empire, this will be a fresh declaration that there is some occult connexion between the Empire and good government. Such an announcement will at once set the Republicans to work to prove that there is some occult incompatibility between the Empire and good government. Consequently the parties opposed to the Government, instead of considering how they can modify its policy and use the power it possesses for the promotion of their own views, will go on scheming how to supplant one Government by another. The change to which they look forward will still be a revolution. This reflection may well make prudent Frenchmen hesitate before they quarrel with the existing Government, whatever faults they may see in it.

Again, it is conceded that, if the Empire is to be set up again to any good purpose, it must be by the co-operation of a class of politicians who were not formerly friendly to it. Its original promoters having been got rid of, its affairs will be managed by a respectable set of directors. But why should these directors associate themselves with the Empire rather than with the competing Company? They have the game so far in their hands that neither rival can obtain lasting power except by their aid. This indeed is the one feature in which the present condition of France is superior to her condition at any former time. The mode-

rate party, by whatever name it is called, has a better knowledge of its own power. It will be said that the fact that it is the moderate party must necessarily indispose it to a form of government which, as has been admitted, may lead to anarchy. But the factions which threaten the Republic with anarchy will not be swept out of existence by the re-establishment of the Empire. They will still exist as an element of danger in the French political system, and their enthusiasm will be only increased by the renewed necessity of stifling all expression of it. Republican fanaticism under a strong Republic is like an explosion in the open air. Republican fanaticism under any other form of government is like an explosion under cover. The force which may be harmlessly scattered in the one case is compressed and made destructive in the other. Some at least of this fanaticism has more to do with names than with things. There are many Republicans probably who would never quite lay aside the conspirator's cloak under an Empire, but would be perfectly content provided that the form of the Government were Republican. Of course this worship of particular phrases is a political error. But what French politicians have to consider is, how this political error may be best deprived of its sting. To take a single instance; there can be no question that M. CARRUTHERS has of late exercised very great influence over the extreme Republicans in the direction of self-restraint; and his youth, character, and antecedents make it probable that, under any circumstances, he will continue to be a powerful factor in French politics. But there will be an immense difference between his position under a Republic and under an Empire. In the latter case his occupation will be gone. He cannot play any conspicuous part without either defying the established order of things or abandoning all the convictions with which his name is associated. In other words, his choice will lie between making himself an instrument of dissension, and consequently of weakness, and losing all power over his followers. He must be either a dangerous agitator or a despised renegade.

There is another consideration which, though it rests at present upon no trustworthy data, ought still not to be altogether disregarded. It is assumed, and very possibly correctly assumed, that there will be nothing to prevent NAPOLEON IV. from playing the part of a quiet and respectable sovereign of a fairly constitutional type. If so, he will certainly have many advantages over any other ruler who is likely to be set up in France. His name will be popular with the army and with a large section of the peasantry; and the very greatness of his father's reverse will invest his son with a romantic interest that is not to be despised even in politics. But hereditary character will sometimes override all the warnings of prudence, and it is yet to be seen whether NAPOLEON IV. will be so little of a BONAPARTE as to rest satisfied with the useful but humdrum part which this calculation of the future assigns to him. If his father could have been thus commonplace in his aspirations, he might have died in the purple. But NAPOLEON III. seems to have had a genuine disbelief in Parliamentary government and constitutional forms which made it impossible for him to work by them so long as he saw a chance of working by any other means. He was as little fitted for the post of constitutional King as Mr. CARLYLE would be for the post of constitutional Minister. This unfitness may not have descended to his son. But the BONAPARTES are not an ordinary family, and speculations which assume that in the next generation they are to become so may after all be falsified by the event.

THE REFORM CONFERENCE.

A LITTLE knot of agitators has lately held a little Reform Conference with the result, if not for the purpose, of showing how little interest is at present taken in schemes for remodelling the Constitution. The commonplaces of electoral reform are too hackneyed to admit of any show of novelty, and the only curiosity which is aroused by notices of reform meetings relates to the names of the promoters, and not to their arguments. Of the late meeting at the Freemasons' Hall it is enough to say that it was assembled at the invitation, and was to have been held under the presidency, of Mr. BEAL. That indefatigable patriot has not enough to do in creating a new Municipality in London and in pro-

pounding to the Board of Trade the principles on which gas is to be supplied. In concert with Captain MAXSE and a few other zealous democrats Mr. BEAL has found time to conduct an agitation for Parliamentary Reform through all its conventional stages. In such cases the first step is for the managers of the movement to call themselves a preliminary meeting, at which, after laying down certain propositions, they appoint themselves a Committee to draw up a Report, which is, like a House of Commons Address, an echo of the original programme. On his third or fourth appearance the principal promoter takes the chair in an assemblage which is in all cases composed of the same elements. At a second or afternoon meeting it is customary, if possible, to procure the attendance of some member of Parliament, and on the late occasion Mr. BROGDEN accepted the invitation of Mr. BEAL. Mr. HOWELL and Mr. ODGER were of course not absent from a democratic gathering; and no celebration of the kind is thought satisfactory without the attendance of Mr. ARCH. It is not the fault of speakers on such occasions that they take for granted the only proposition which is seriously in dispute. The figures which they glibly manipulate clearly prove that electoral representation is not at present equally distributed. So many small boroughs return so many members, while Liverpool and Manchester and Birmingham, with a population many times larger, only return so many more. From time to time a careless speaker or journalist of another order has described the existing inequalities as anomalies, and the assembled reformers eagerly quote his admission. If, in truth, it is desirable that the numerical majority of the population should exercise absolute power, the English Constitution, with all its recent democratic modifications, is wholly indefensible. Mr. BEAL's figures are probably accurate, and the main objection to the adoption of his doctrines is not that symmetry has been already attained, but that the exclusion from political power of the upper and middle classes would probably not conduce to good government. The Electoral Reform Association, having informally appealed to public opinion, finds that its strength is represented by an active local politician, by two or three obscure members of Parliament, and by the extreme revolutionists who, like Mr. ODGER, would equalize property as well as electoral districts. The rest of the community is either opposed or indifferent to the proposed changes.

The petty club which under many names employs itself in the business of agitation is itself divided on questions of expediency, if not of principle. The gentleman from Birmingham who acted as Mr. BEAL's substitute took credit in his opening address for the moderation of his proposals, while he at the same time appealed to the sympathies of his audience by hinting that he would not be satisfied with the concession of his immediate demands. Parliament and the country are gravely asked to make comparatively moderate concessions to demagogues who confidentially inform their followers that, having once obtained uniform suffrage and equal electoral districts, they will have no difficulty in enforcing the remainder of their claims. It is impossible to deny that they are logically in the right, but for rhetorical or persuasive purposes it might be more judicious to practise a politic reserve. It is precisely on the ground that equal electoral districts would paralyse resisting forces that prudent and moderate politicians close their ears to Mr. BEAL's seductive and plausible statistics. In the particular instance, the moderation of the managers of the Conference must have been assumed, not for the purpose of securing unanimity among the audience, but of quieting the imaginary alarms of an indifferent community. Captain MAXSE and Mr. ODGER are as far advanced in democratic convictions as Mr. BEAL or Mr. WRIGHT; and the meeting in general sympathized only with extreme opinions. Amendments to the principal resolutions were moved and carried, and Mr. BEAL and his Committee seem to have unnecessarily exposed themselves to a series of rebuffs. Their next mortifying defeat was inflicted by Miss LYDIA BECKER and some other spirited ladies. Although the Chairman ruled that a motion in favour of female suffrage was foreign to the objects of the meeting, Miss BECKER and her gallant associates successfully insisted on a share in the proposed dilution of the suffrage. Whatever may be thought of the so-called rights of women in general, it would be difficult to resist their claims on the principles of the Electoral Reform Association. When it is once assumed that the right of voting is a personal privilege, and

that any consideration of the purposes to which it may be applied ought not to affect constitutional legislation, it follows that no incapacity ought to exclude women from the franchise. In spite of the efforts of the managing Committee, the Association resolved that Mr. FORSYTH should be asked, in common with Mr. TREVELYAN and Sir C. DILKE, to contribute his share to the deterioration of the electoral body. The power of Parliament and of the constituencies has been so firmly established during the long prevalence of a restricted suffrage, that democratic reformers have hitherto not foreseen the danger of transferring the centre of political gravity to some other kind of authority. In many parts of the Continent, including the German Empire, universal suffrage is found consistent with nearly absolute monarchy.

Politicians of higher rank than Mr. BEAL may perhaps learn from the failure of his agitation that they have been tempted to bid for popularity too hastily, and in a wrong direction. With the exception of a sensible speech by Captain MAXSE against the rights of women, the most plausible arguments used at the meeting consisted of references to speeches by Mr. DISRAELI and Mr. GLADSTONE. Flesh and blood are not admitted to the polling-booths in equal proportions; and Mr. TREVELYAN's Bill for household suffrage in counties would effect only a part of the objects of which Mr. GLADSTONE has from time to time approved. The countenance which Mr. DISRAELI has given to the Reform agitation is probably to be explained by the apparent and temporary success of his last experiment of the same kind. In the debate on Mr. TREVELYAN's Bill Mr. DISRAELI confined himself with ostentatious reserve to collateral or incidental objections to the immediate concession of household suffrage in counties. It is not certain whether he was at the time preparing the way for a future change of policy, or only covering his retreat from a position which he had imprudently occupied. His appeal to the regard of the small boroughs for their own political privileges will not be forgotten by those concerned; and since the close of the Session the Government has received notice that the farmers are not prepared to acquiesce without resistance in virtual disfranchisement. Two months ago the official managers of elections imprudently adopted a candidate for Cambridgeshire who may probably have deserved the confidence of the Government. The tenant farmers had already elected Mr. RODWELL, because in the neighbouring county of Suffolk he had taken a leading part in resisting the dictation of the Labourers' Union. If Mr. DISRAELI should at any time attempt to carry Mr. TREVELYAN's Bill, he will encounter uncompromising resistance in Cambridgeshire, and probably in other counties. The ends for which Mr. ARCH and his adherents would use political power are fully understood by the objects of their hostility.

The noblemen and gentlemen who have followed Mr. BEAL in the promotion of the London Municipal Government Bill will perhaps begin to doubt the wisdom of their conduct when they learn that their leader is the political ally of Mr. OUGER and Mr. HOWELL. The modest proposal of handing over the corporate property to the outlying districts of the metropolis is perfectly consistent with the principles of the chief members of the Electoral Reform Association. If the precedent of seizing corporate estates were once established by Parliament, a heavy blow would have been struck against the security of private property. Some enthusiastic democrats may perhaps hope that a municipal government elected by household or universal suffrage would, like the Commune of Paris, sometimes protect and sometimes overawe a House of Commons which would derive its commission from a similar constituency. Thus far Mr. BEAL has succeeded better as a corporation reformer than as a political agitator. No Conservative peers attended his meeting at the Freemasons' Tavern, nor would Lord ELCHO be inclined to introduce a Bill for the establishment of equal electoral districts. The very newspapers which welcomed the project of the Municipal Bill with inconsiderate applause scarcely allow one or two columns in the dead season of the year to the report of the proceedings of the Electoral Association.

THE POPULATION OF FRANCE.

THE volumes of elaborate statistics on France as compared with other countries which M. BLOCK has recently published, give, among other things, some very curious information on the population of France. The

wealth which France has recently been discovered to possess has taken many persons by surprise. There must have been a vast amount of wealth accumulated, by Frenchmen of all ranks to enable them to collect in two or three years so many millions sterling for investment in their new Rentes; and that the vast proportion of these new Rentes is held in France is made obvious by the very small amount of coupons for which France has now to make provision in foreign countries. When the issue was first made by M. THIERS, it was largely by foreigners, and particularly by Englishmen and Germans, that the loan was taken. But gradually the French have bought their own stocks, and now the proportion of the French debt which is held out of France is very inconsiderable. What is interesting to notice is that the wealth and the accumulation of wealth which these facts indicate are the acquisitions of a population which, if not stationary, increases very slowly indeed. M. BLOCK is proud of this, and sees in it a proof of the enlightenment and good sense of the nation to which he belongs. Political economists for a long time taught the doctrine that the road to prosperity was to keep the population within the limits of comfortable subsistence. M. BLOCK says that what MALTHUS preached the French have practised. But he says that the process is not due to a sudden and violent conquest of human nature, but simply to the gradual perception of what is fitting and necessary, which goes with increasing civilization and intelligence. Overpopulation is, according to this view, only possible where the people are degraded, ignorant, and without hope or ambition. Civilized people will be guided in the matter by the most obvious attention to what their own interests demand. In England a different mode of looking at things prevails. The population of England has doubled within a period in which the population of France has remained almost stationary, and with this rapidly increasing population we associate many things which we prize highly—our very great wealth, our colonial Empire, our habits of independence, our love marriages, our trust that the crumbs will be provided for the sparrows. If we were to argue for ever, Englishmen would rest persuaded that their way is best, and Frenchmen would rest persuaded that their way is best, and it is no use to argue under such circumstances. What is worth noticing is that the French have unconsciously walked in the paths of Malthusian philosophy, and they have reaped the reward which the prophets of political economy assured them would be theirs. They have got wealth; their wealth is diffused through their population; and their wealth is at once the consequence and the cause of the spread through the country of thrifty, industrious, and sober habits.

Since 1801 a census has been taken of the population of France every five years. In 1801 the population was 27,000,000, and in 1806 it was 29,000,000; but the census in its early days was taken so imperfectly that the probability is, not that the population had augmented by 2,000,000 during the wars of NAPOLEON, but that the second census was more accurate than the first. In 1821 the 29,000,000 of 1806 had only become 30,000,000, and at that date the population of England and Wales was only 12,000,000. In 1871 the 30,000,000 of France had become 36,000,000, while the 12,000,000 of England had become 22,000,000. To the 36,000,000 of France we have, in order to estimate the growth of the population, to add 2,000,000 for the lost provinces of Alsace and Lorraine, and then we must deduct 700,000 for the annexed provinces of Savoy and Nice. The real increase of the French population was therefore in fifty years 7,300,000. This is a very inconsiderable proportional increase as compared with that of England. The French gain is almost exactly one-fourth additional, or 25 per cent.; the English gain is five-sixths or 80 per cent. Still seven millions increase is in itself not an insignificant one; but the curious fact revealed by M. BLOCK's statistics is that the augmentation, such as it was, arose, not from any increase in the number of births, but from the fact that those born live longer. The number of births in France has remained almost stationary for seventy years. In 1806 the number was 916,000. In 1870 it was 943,000. This shows that, as time has gone on and the habits of the people have become more formed, or, in the language of M. BLOCK, as enlightenment has increased, there are fewer births in proportion to the population. It also shows that the average duration of life has increased, more people being alive at the later date, with only the same number of babies to replace them. If people live longer,

this, as M. BLOCK justly argues, shows that the conditions of life are more favourable. There is more comfort, better nourishment, risks in dangerous occupations are better guarded against, medical skill mitigates the ravages of disease. France is thus proved to be better off indirectly, just as the production of so much money to take up the new loans proves the same thing directly. And the same result is arrived at in another way still more indirect. Nature in France, as all over the world, gives the struggling race of man a slight—it is but a very slight—lift, by ordering that the proportion of men born shall be greater than that of women, which, as men are used up faster under the pressure of life than women, is a trifling gain to start with. In France, however, as in almost every other country, there are at any one moment more women alive than men, because the pressure of life more than counterbalances the superiority in number of male births. But what delights M. Block is that his tables show that the numbers of the men and the women alive in France at any one moment tend to become more and more equal. In 1801 there were 48 and a fraction men to every 51 and a fraction women in France, whereas in 1871 there was almost the same figure on each side of the account. There were 49.81 men as against 50.19 women. This result can only be attributed to one cause, and that is that the pressure of life is not so great on men as it used to be. Men live longer because they are not so soon killed off by dangerous occupations, disease, and want. Their numbers accordingly come nearer to those of women, and thus the general condition of the country is again in this way shown to be continually more flourishing.

These statistics suggest what, from the ladies' point of view, may be termed a pleasing picture of the future of humanity. We have often heard of late years in England feminine lamentations over the existence of what was supposed to be in the nature of things an excess of women who on no hypothesis could be married, as there were not the men at command to marry them. What, it has been piteously asked, is to become of this unhappy residuum? and it was answered that they should nobly front their fate, and, by acquiring early habits of industry, learn to gain their own bread, and so be independent of the short-coming sex. But M. Block comes to the rescue, and shows that something much more delightful than this is possible—namely, that by extending civilization, by inspiring prudence and sobriety, by insisting on precautions in dangerous trades, and by avoiding wars, a larger number of men may be kept alive, the sexes balanced, the melancholy residuum eliminated, and a theoretical husband found for every one. Even as things are, it may be observed that more women are married than men, for the French tables show that every one in six of the men who marry once marries twice, while only one in twelve of women forms a second marriage. Nor is it true that the example of France must be taken to show that the secret of French prosperity lies in any disinclination to marriage, or in not marrying. On the contrary, the French do marry very generally indeed. Of Frenchmen between the ages of thirty-five and forty 80 per cent. are married; and as to disinclination to marriage, M. Block scorns the imputation. He goes into calculations on the subject which are not, indeed, fortified by any actual statistics, for that was from the nature of the case impossible, but which at least show the habitual thoughts and beliefs of an intelligent Frenchman who is familiar with computations of the kind. M. Block estimates that if a hundred Frenchmen were taken, unmarried, but of an age to marry, about 40 per cent. would be found to be prevented by ill health or some similar obstacle from marrying; one, or at most two, would not wish to be married if they could; and all the rest would be longing to be married if they could afford it. This is a most romantic picture of a hundred Frenchmen, and all that can be said of it is that, if it is true, the most determined lady could not find a word to say against France on this score. What then is the secret of French prosperity? It is, according to M. Block, merely that French people are sensible enough to wait. They marry, but they do not marry early. They do not think much of the romance of young lovers. They regard marriage as a pleasant arrangement to enjoy which they must wait and work. The average age at which Frenchmen marry is thirty-one in Paris and thirty in the rest of France. The average age at which Frenchwomen marry is twenty-six in Paris and twenty-five in the rest of France. These ages indicate that marriage is deferred to a date decidedly later

than is customary in England, and the result is that married couples are in France more assured of what answers to the French standard of comfort. It is not, we may repeat, a question of imitating the French, for nations cannot easily imitate one another; but it explains much about France, with its hidden wealth and recuperative powers, which might not otherwise be understood, when these statistics have led us to see that the primary basis of this prosperity is that the average of the women in France are willing or are forced to wait till they are twenty-five to be married.

THE RAILWAY WAR.

IT was of course foreseen that, if the Midland Company persisted in carrying out the changes which had been announced in the working of its passenger traffic, other Companies would be compelled either to follow its example or to devise some other means of meeting the threatened competition. And this is what has now occurred. On Tuesday the policy of the Directors of the Midland was formally approved by a large majority of shareholders, and next day the representatives of the London and North-Western, Great Northern, North-Eastern, Lancashire and Yorkshire, Great Western, and Manchester, Sheffield, and Lincolnshire Companies had a meeting, at which they resolved to recommend their Boards to follow any reduction of prices made by the Midland Company anywhere, to continue second-class carriages at reduced fares, and generally to co-operate in the interests of railway property. It remains to be seen whether this course will be adopted by the various Boards, and sanctioned by the shareholders; but in the meantime it is not surprising that the prospect of bitter, relentless, and probably ruinous, competition which is thus opened up should inspire the holders of railway property with very uncomfortable apprehensions. Whatever might be the ultimate result of such a struggle, it must in the first instance inevitably involve heavy sacrifices and some very serious risks. It would be a mistake to suppose that the vote of the Midland meeting implies serious approval of the resolution of the Board. It is obvious that in such a case the shareholders are necessarily very much in the hands of the Directors. They may have their own views as to what ought to be done, but they have to count the cost of enforcing them, and it is only natural that they should prefer to run the risk even of a dangerous experiment rather than create a revolution at the Board. It is perhaps unnecessary to speculate on the probable results of changes which will immediately be tested by actual experience; but the manner in which, as it now appears, the Directors plunged into their new policy is certainly by no means hopeful. The Chairman in his Circular indignantly repudiated the suggestion that it had been hastily adopted; but it is now explained that, in point of fact, the plan had long ago been before the Board, and had been repeatedly rejected, until at last it was adopted "somewhat suddenly." Before the Directors left the room their decision was in type, and it was instantly published. The refusal to postpone the proposed changes until the other Railway Companies had had time to consider them and to see whether some uniform system could not be arranged also points in the same direction. This nervous precipitancy is an unmistakable symptom which speaks for itself. Everybody knows the state of mind in which people who have for a long period consistently distrusted a particular project suddenly adopt it, and hasten to pledge themselves to it on the instant, lest cooler consideration should again revive their doubts. People who are firm in their conclusions are not afraid of reconsideration and discussion.

There is perhaps no mood in which more fatal errors are committed than that in which there is a disposition to assume that "something must be done" without reference to whether the something is really a wise thing in itself. It seems that the Midland Board has long been dissatisfied with the position of its system. It originally formed part of the route from London to Leeds, York, and Scotland, via Rugby and Normanton, and it has never recovered from its discomfiture when a more direct and convenient route was opened. It was hoped that the Settle and Carlisle extension would make the Midland a complete system, independent of its neighbours; but the mere making of a new line is not enough. It must be pushed and advertised; something must be done to call attention to

it and to tempt traffic to come that way. The reference in the Chairman's Circular to the cultivation of commercial traffic is now made clear. Mr. BASS stated on Tuesday that the adhesion of that "important class of the community," commercial travellers, had been secured. It had been ascertained that, if these gentlemen were allowed to ride first class, they "would exercise considerable influence as to the way in which the goods they sold should be sent to their destination," that is to say, they would take care to send all they could by the Midland. It must be admitted that this is a great lift for the bagmen, who are thus elevated into a sort of balance of power in the railway system. It is unnecessary to suppose that the Midland Directors have really been foolish enough to be influenced by expectations of this kind, but the fact that they should be put forward for the encouragement of shareholders would seem to indicate at least a significant deficiency in more solid argument. It is characteristic of the spirit in which the Midland Directors have acted throughout the whole of this business that they should have refused to consult with the other Companies as to the best course to be adopted. It is naturally the duty of the Midland to consider its own interests before those of other people, but it is absurd to suppose that it would have been in danger of being persuaded to sacrifice itself for the benefit of the London and North-Western or the Great Northern, or that any number of Companies in combination could compel it to adopt a particular system of working against its will. If the Midland had agreed to a conference, it would still have been perfectly free either to hold to its own policy or to join in the resolutions which might be passed; but it would have had the advantage of hearing all that could be said on the subject, and of considering whether the objects which it has in view could not be attained by some plan which might be generally adopted. All sorts of subjects relating to railway management are constantly brought under discussion in this way; and it is childish to describe a familiar and useful practice as "submitting the policy of a Company to the determination of its rivals."

It is possible that the disastrous warfare which is apparently impending may be averted; but it must be admitted that the obstinate perversity of the Midland Company in refusing to agree either to discussion or delay is necessarily extremely embarrassing to other Companies. It may be doubted whether in the long run the Midland Company will really increase its revenues by the changes which it is going to make; but it is probable that in the outset it will at least augment what will then be its first-class traffic; and in that respect Companies which continued to adhere to the old tariff would be placed at a disadvantage. If, however, the other Companies, as is proposed, reduce both their first and second class fares, they will give all who care to ride first class accommodation equal to that of the Midland, while a great many third-class passengers will be tempted to avail themselves of the cheapened second class. It must be remembered that the recent extension of facilities for third-class traffic has affected all railways more or less. The second class has, as it were, had the bottom knocked out of it, and the traffic has dropped into the class below. The natural way to recover this traffic would seem to be, not to abolish the second class, but to make it more tempting by a reduction of fares, the existing tariff being altogether excessive in proportion to the very meagre difference in accommodation between second and third class carriages. There are a great many people who either cannot afford, or do not think it worth while, to pay the present high second-class fare, but who would gladly pay something over the third-class fare for the sake of avoiding the roughest kind of company; and we should imagine that it would pay very well to cultivate this class. Under the Midland scheme, these people will be left in the third class, and the extra fares which might otherwise be got out of them will be lost, for they will certainly not go first class. It may be said that the Companies which keep up three classes will lose the advantages to be obtained by the Midland in the way of faster trains and reduced working expenses; but these economies are of a somewhat doubtful kind. It will always pay to run well-filled carriages. As to the first class, there is no reason why other Companies should not in some degree follow the example of the Midland in making passengers understand that, if they want to be sure of privacy or extra room, they must expect to have to pay for it. The abolition on the Midland of reduced fares for return tickets neutralizes the boon conferred by the removal of re-

strictions as to the date of return; but much popularity would be secured by any Company which offered those advantages together. There are undoubtedly various changes which the Companies might make in order to attract passengers, and to place themselves in a favourable position for competing with the new system of the Midland; but the test of the soundness of all measures of this kind should be, not whether they will hurt the Midland, but whether they will actually do good to the Companies by whom they are introduced. The bitter experience of the past should supply a sufficient warning against a war of reckless retaliation and revenge. Some way might surely be found of roasting the pig without burning the house.

THE LONDON GAS QUESTION.

THE letter which Mr. FARRER has written in Sir C. ADDERLEY's name to the indefatigable Mr. BEAL will discourage the promoters of the Corporation and Metropolitan Board Gas Bills. Mr. BEAL himself had suggested, in his interview with the PRESIDENT of the BOARD of TRADE, that it was not advisable to revive competition, to break up the streets for the introduction of double sets of mains and of distributing apparatus, and, as he might have added, to throw away hundreds of thousands of pounds in pursuit of an object which is already attained. It was not to be expected that Mr. BEAL and his friends would remonstrate against a violation of the principles hitherto adopted by Parliament, and a wanton destruction of the property of the shareholders. When he remarked that the Corporations would undersell the Companies, or *vice versa*, he involuntarily extenuated the injustice of the proposed measure. Private traders are entirely incapable of competing with public bodies, which can make good their trade losses by means of taxation. Sir C. ADDERLEY is equally silent with Mr. BEAL on the protection which is due to property acquired in reliance on the faith of Parliament. He may ascertain, if he inquires into the question, that Parliamentary Committees have uniformly refused to sanction the competition of corporate bodies with existing Companies for the supply of gas and water; but perhaps in his answer to the deputation he may have intentionally confined himself to the task of stating the objections to Mr. BEAL's proposals. As Sir C. ADDERLEY justly remarks, the history of past legislation is not favourable to any attempt on the part of Government to enforce amalgamation as a step to further measures. In substance the Board of Trade seems to agree with Mr. BEAL in the questionable proposition that large savings in the cost of supply and administration might be effected by the reduction in the number of Companies; but Sir C. ADDERLEY and his advisers deserve credit for a desire to promote economy by enlisting the interest of the Companies in the promotion of improvements.

It is not improbable that, in the presence of a more formidable agitation, the City of London and even the Metropolitan Board of Works may reconsider their intention of attacking the Gas Companies. The owners of private and corporate property too often connive at isolated attacks on the rights of their neighbours; but when they are themselves simultaneously assailed, they may be expected to feel a certain regard for vested interests. When the deputation for abolishing the privileges of the City of London waited upon Mr. CROSS, Mr. HENRY COLE urged as one of the reasons for constituting a metropolitan municipality the advantage of obtaining gas at cost price. If an advocate of the Corporation had objected that one element of cost ought to be the purchase at a fair value of the property of the Companies, Mr. COLE might have replied that the City itself had given notice of a Bill for the establishment of a subsidized competition. The susceptibilities of the Corporation may perhaps be quickened by the knowledge that it has a common enemy with its own proposed victims in the person of Mr. BEAL. The professed hope that the Corporation would be, by Mr. BEAL's blandishments, tempted to commit suicide was probably from the first but a diplomatic fiction. If any illusion prevailed on the subject, Lord Mayors, Aldermen, and Liverymen have lost no time in disabusing the minds of their opponents. When Lord ELCHO brings forward his Bill for transferring the corporate property to strangers, the City of London will do well, instead of discussing the comparative utility of the present system and the proposed substitute, to take its stand on the simple ground of unquestioned possession,

and to deny the expediency or justice in any circumstances of compulsory expropriation. Mr. BEAL and Mr. COLE may not inconsistently demand on behalf of their future municipality the exclusive control of the gas and water supply of London. The Corporation will greatly weaken its own position if it is at the same time defending itself and attacking Joint-Stock Companies.

If the gas consumers or their representatives satisfy themselves that unnecessary expenses are at present incurred by the Companies, they may reasonably insist on the purchase of the property. The consumers are the beneficial owners of surplus profits after the payment of limited dividends; and Sir C. ADDERLEY is justified in his belief that the Companies, having attained their maximum receipts, have no strong interest in the further improvement of the property. The simplest mode of escaping from the consequences of former legislation would be to transfer the supply of gas on equitable terms to some public body. In the answer of the PRESIDENT of the BOARD of TRADE to the deputation a more complicated plan is recommended. "It deserves serious consideration whether, the terms of the ultimate purchase being first determined, the Companies should not be allowed on complete amalgamation to increase their dividend beyond the present fixed limit in some fixed proportion to any reduction they may thus effect in the price of gas." If all Sir C. ADDERLEY'S assumptions proved to be correct, much might be said in favour of the principle which he adopts; but it is doubtful whether any considerable expense would be saved by amalgamation, inasmuch as the productive resources of the larger Companies are required for their present use. Within a few years the Companies and their customers have suffered extreme inconvenience from delays interposed by the Legislature in the way of their providing additional premises and works. Vast sums have been since expended on the purchase of land and the construction of works; and the Board of Trade greatly exaggerates the alleged waste under the present system. It may perhaps be true that a smaller number of places of manufacture would be sufficient if the works were now all to be constructed for the first time; but if the Companies were amalgamated, they would find it cheaper to maintain the present sources of supply than to abandon them for larger works. The Board of Trade cannot be supposed to have investigated the complicated reasons which have determined the choice of sites for the manufacture of gas. The necessity of avoiding as far as possible populous neighbourhoods accounts for some of the apparent anomalies which may be discerned on the face of the map. In other respects no considerable saving would result from a diminution in the actual number of Companies. The cost of the Boards themselves is insignificant, and it would seldom be practicable after amalgamation materially to reduce the staff. If the present dividends were increased, even after a diminution of price, the agitation to which the Companies have long been exposed would probably become more violent. It is difficult to understand how the terms of purchase could be settled beforehand if the dividends which might be earned were uncertain.

It is, as Sir C. ADDERLEY says, improbable that any large increase in the value of the property, and therefore in the consideration to be hereafter paid for it, will be sanctioned by Parliament; and yet the possible purchaser would be in no way injured by any increase in the purchase-money, provided it only represented the additional value of the property. It is evident that a dividend of 12 or 9 per cent. in the place of 10 or 7 per cent. would increase the value of the property of the Gas Companies; and they would be grievously injured if they were compelled to sell their undertaking at a sacrifice of income. It might indeed be possible to enact prospectively that a specified public body should be empowered to purchase the property at any time on the basis of the dividend which might have been earned during a certain period; but as the option would probably be exercised as soon as the dividend exceeded the present limit, the Companies would have no object in saving expense or in acquiring additional custom. If a change is required, or if it is conducive to the public interest, there can be no sufficient reason for delaying it. It is indeed doubtful whether the consumers would derive any advantage from a transfer of the power of supply; but at present they are assured by agitators that they have reason to complain, and, on the other hand, the shareholders are disquieted by periodical attacks on their property. It would, on the

whole, be desirable to complete the legislation of former years by securing to the proprietors their legal dividends and relieving them from the duty of managing the gas supply. The Corporation and the Metropolitan Board of Works would lose nothing by a purchase, and it is barely possible that the consumers might ultimately gain.

SCOTLAND AND CHURCH ESTABLISHMENTS.

THE meeting of the Commission of the Free Church General Assembly disposes of one of the arguments used last Session against the Scotch Church Patronage Bill. It was said, notably by Mr. GLADSTONE, that the Bill was faulty because it made no overtures to the Presbyterian communions outside the Established Church. The Free Church especially had seceded rather than submit to the law which it was proposed to alter, and if, after an interval of thirty years, the cause of this secession was to be removed, it was only decent that something should be done at the same time towards undoing a result so much to be regretted. It is now evident that, if the Church Patronage Bill had been made to depend upon any willingness on the part of the Free Church to be reunited to the Established Church, it would never have become law. On Wednesday the Commission, by 116 votes against 33, adopted a Resolution which is absolutely inconsistent with the principle of religious establishments as it has been understood in recent times. It is true that the Resolution makes the Free Church maintain steadfastly "the duty of a national recognition and promotion of Scriptural truth." But it altogether disavows the notion that, in return for this recognition and promotion, the State is to exercise any control over the Church. To hold that the Church is bound to obey the directions of the civil court relating to the civil rights of her members or to the statutory duties of the ecclesiastical authorities is to encroach upon the Scriptural liberty of Christians. Consequently the State is to give all and to receive nothing. It is to spend its substance in recognizing and promoting Scriptural truth, but if it so much as hints that a Church which consents to take its money is bound to obey its laws, it is warned off the holy ground, and forbidden to interfere with the Church's "peculiar and incumbent duties." Nothing in the nature of a Church Establishment is possible on such a basis as this. A community composed of men of all creeds does not set up a State religion because it desires a national recognition of Scriptural truth. It does so because there are many advantages in placing a matter of so much importance as religion under the control and supervision for certain purposes of the Civil Courts. If this control is to be repudiated by the authorities of the religious body which is distinguished by special privileges, there are but two possible courses for the State to take. It may enforce the supremacy of its own courts, or it may disestablish the Church which denies this supremacy. Supposing that the Free Church were now established by law, one or other of these courses would certainly have to be taken. The Resolution of the Commission of the General Assembly asserts that when Scriptural truth is subsidized by the State, no control must be exercised over its ministers by the law courts even in matters relating to civil rights or statutory duties. This is a pretension which would be incompatible with the retention of the position of an Established Church, and it is equally fatal to any proposal for a restoration to that position. The Resolution goes on to declare, with much consistency, that the Patronage Act, instead of rejecting the control of the temporal courts in temporal matters, tends rather to confirm it; and on this ground it denounces the existing connexion between Church and State in Scotland as unscriptural and inequitable. "Consequently its termination is an essential preliminary towards a beneficial readjustment of Scottish ecclesiastical arrangements." It follows from this that, if any proposal for bringing back the Free Church into the fold of the Establishment had been incorporated into the Church Patronage Bill, the Government would have had its offers flung back in its face. It was necessary that the measure should stand on its own merits, and be known to be, as it was, a mere Bill for effecting a particular change in the law relating to the Established Church.

It must be admitted, however, that, though the attitude of the Free Church invalidates this particular objection to the Patronage Act, it raises doubts as to the wisdom of passing any Act on the subject. The text of the Resolu-

tion and the speech in which its adoption was moved point unmistakably to a more or less active agitation in favour of disestablishment on the part of the Free Church. Dr. RAINY distinctly said that it was time for the members of the Free Church to make it clear which way their faces were set. Dr. BEGG, who opposed the Resolution, did so on the ground that its adoption would commit the Commission to a crusade against the Established Church. The Resolution was not passed, therefore, in ignorance of its true character. Its nature and operation were made abundantly clear to the Commission, both by those who liked it and by those who disliked it. Yet, after all this, the division showed a majority of more than three to one in its favour. It may be some time before the Free Church gives any practical effect to the decision of its representatives, but when once religious bodies take to making it clear which way their faces are set upon any question, they are apt to quicken their pace very soon after they have begun moving. The Free Church is strong in numbers, in influence, and in zeal, and the last words of the Resolution indicate a determination to summon the United Presbyterians to make common cause with them. Hitherto it has been supposed that the United Presbyterians are more hostile to the Established Church than the Free Church is, and if this relation between the two bodies is maintained, the crusade which the minority of the Commission deprecate will be organized without much delay. The Scotch Establishment stands in a different position from that in which the English Establishment stands. It is not the Church, it is known not to be the Church, of more than a minority of the people of Scotland. Whenever the Free Church and the United Presbyterians choose to unite their forces, they can largely outnumber it. It is probable, at all events in the first instance, that a proposal to disestablish the Church of Scotland would not be left to be settled, as most Scotch questions are settled, by the votes of the Scotch members. It would be resisted by the whole Conservative party in Parliament, irrespectively of nationality or creed. But it is difficult to believe that, if a majority of Scotchmen made up their minds that Presbyterianism after the manner of the Established Church should enjoy no more privileges than Presbyterianism after any other fashion, they would be very long in getting their own way.

There seems to be a sort of fatality attending Conservative Governments in their dealing with ecclesiastical questions. Here is a reasonable and Liberal measure, designed to widen the basis of the Established Church and to give her a stronger hold upon the Scottish people, which threatens by way of result to create a new and formidable outcry against the very institution which the authors of the Bill wish to protect and strengthen. It would not be difficult to suggest a parallel in the case of the Church of England. The fact is that a Conservative Government is to an Established Church what a new and friendly landlord sometimes is to the tenant of an old house. For many years, perhaps, the tenant has tried in vain to get any repairs done, but except that there is a hole or two in the roof, that the walls show some cracks, and that the foundation has a slight tendency to settle, the house has served his purpose fairly well. By and by there comes in a fresh landlord, who has something of the new broom in his composition, and who is perfectly willing to do anything in the way of repairs that his tenant can reasonably ask for. The occupier of the house is delighted, builders are called in, plans and estimates are prepared, and the workmen are put on without the loss of a moment. For a little time all goes well, but there comes a day when the landlord comes to see the tenant, and tells him, after much beating about the bush, that the more the workmen have done the more they have found to do, that the walls cannot be touched without bringing down the roof, that the foundations cannot be strengthened without peril to the walls, and that he has come to the conclusion that it will save money in the end to pull down the house altogether. The present Government are as yet in an early stage of this process. They have succeeded to power in the character of friends of the Church Establishment, and what can be more natural than that they should justify their reputation by removing abuses and supplying defects? The time is yet to come when they will find out that what looks like a mere unsightly block of wood may prove to be the beam on which all the timbers of the house depend. There is no putting new cloth into old garments. Established Churches that have gone on without material change for centuries cannot

be altered and refaced without being in danger of coming down altogether. There is much wisdom in the warning which Mr. KNATCHBULL-HUGESSEN has just given in his speech at Deal, and it is to be hoped that it will be seriously considered. If the Ministry do not promptly recognize the wisdom of letting things alone, they are likely to have the lesson impressed on them by a revival of ecclesiastical agitations which they may find it hard either to appease or to guide.

RECRUITING.

SOME political cynic observed that he never felt certain of the truth of any statement until he saw it officially contradicted. The newspapers have this week contained two communications from high authority which the public seem disposed to accept in the same sense as they did the celebrated declaration that certain clauses in the Endowed Schools Act Amendment Bill were among those things which no Prime Minister could understand. One of these officially authorized statements was, that "the establishment of the army has been complete during the year, and the recruits, though young, are of a good stamp, and more than meet the requirements of the recruiters as regards standard." This may be literally true, and yet it would be far from supporting the more general statement which precedes it, that recruiting is satisfactory. Assume for the moment the "good stamp," and take it that the only fault of the recruits is that of youth, which time and good food and training will correct. The very gist of the warnings which have proceeded from every experienced officer who has written on this subject is that, under our present system, these young recruits will have no opportunity to grow into mature soldiers. Those who are old enough to remember the Crimean war will not disregard the lesson which it conveys. The army which fought at Alma and Inkermann was as fine an army as ever stepped. Sir JOHN BURGOYNE, who was not a boastful man, has recorded the admissions of French officers that their army could not have done what ours did. But that army perished by sword, sickness, and privation, and we have never had another like it. When our men had fallen before Sebastopol, we sent boys to take their places, and the result was such as might have been expected. One regiment, consisting chiefly of recruits, "though young, of a good stamp," was sent to the Crimea by way of reinforcement to the main army, and almost the whole perished. The operations of 1855, however we may view them, are scarcely matter of exultation; and it is at least possible that the failure at the Rodan was partly due to the rawness of the troops engaged. In no other serious business should we set a boy to do a man's work, and even the great NAPOLEON failed when he attempted this in war. It may be true that he gained victories with boys, but he did not prevail on the whole campaign; and besides he was a general on whom soldiers might depend, whereas British generals are apt to depend upon their soldiers. This country is bound by treaties under which it might become necessary to send and to keep an army on the Continent, and this, as matters stand, could not be done. There are at most a few thousand men of the "stamp" of those that fought at Inkermann, and when these are expended, we must fall back upon recruits whose only fault we may admit would be youth and inexperience. We should enlist boys at vast expense, and send them abroad to die. No statements on authority can prevent experienced officers from drawing conclusions from what they see, or rather do not see, in the existing army; and if we could deceive ourselves, we could not deceive our neighbours. German and French journalists sometimes comment on the communications of authority to English newspapers, and it would be interesting to learn what they think of this particular utterance of the oracle. Assume that "the establishment of the army has been complete during the year," still the question remains whether that establishment is adequate to the necessities of the case, and upon this the oracle is silent. It is better to know the truth, however unpleasant, and we content ourselves with saying that, if there be any army of men in the country, we should like to see it. The utmost that can be reasonably inferred from the statement of authority is that the recruits of this year are rather better samples than those of last year, whose "stamp" largely was, or ought to have been, the letter "D." The mind of the Inspector of

Military Prisons was lately exercised on the question, What is the use of reclaiming a deserter whose delicate frame cannot support hard labour? It was perhaps a hasty generalization to infer from this officer's Report that the bulk of recruits had neither health nor honesty. We are now informed on authority that they "more than meet" the requirements of the recruiters as regards standard, but unfortunately a boy's perpendicular measurement affords no test either of his principles or constitution. There is further the vague assurance that these recruits are of a "good stamp," though young, and it is added that they have been raised without any unusual exertions. If we asked whether unusual exertions had been required to keep our recruits when we had got them, the answer might perhaps be unsatisfactory.

But, whatever may be the precise meaning of this official communication, there is to be set against it "the universal testimony of every officer one meets from the highest to the lowest." Colonel ANSON, writing in the *Times* on the very day on which the statement by authority appeared, uses these words, and adds that that testimony is to the effect that the quality of our recruits has sensibly deteriorated; that insubordination is increasing, and dissatisfaction exists to an extent unknown in former days; that the class of men we now obtain creates an utterly untrustworthy reserve, and in case of need we should not be able to lay our hands on ten per cent. of them; and that, as in 1876 some 25,000 men will be able to claim their discharge, we must go from bad to worse to supply their place. The controversy which has arisen between Colonel Anson and the *Times* would be amusing if the subject of it were not so vitally important. The apologists for the system or no-system which exists complain of Colonel Anson's declaration that it is "beneath contempt," and insist that it cannot be judged until the year 1876 arrives. Perhaps we may have an army in that year, and perhaps we may not. Colonel Anson is certain that we shall not, and his opponents are not very certain that we shall. He mentions one officer as an exception to the general consent of experienced opinion; and that officer likes to get boys because he can train them as he pleases, "forgetting that, if short service were really adopted, he would not have an able-bodied man in his regiment." It is probably in reference to this and similar passages in Colonel Anson's letters that the *Times* observes that the public know how to discount the grumbling which is a privilege of the service. If the public do know this, they are wiser than we take them to be. To us the grumbling appears general and only too reasonable. All that we see and hear points to the opposite conclusion to that to which the *Times* would lead us. There is of course the "authorized paragraph" already discussed. The *Times* founds an article on it, and *ex nihilo nihil fit*. It would not be worth while to criticize these articles if they were not, so far as we know, the only considerable exception to the general chorus of complaint. We examine them to see what can be said to quiet the public mind, and the result is seriously alarming. The Inspector-General of Recruiting is quoted by the *Times* as saying that "on the whole a satisfactory number of eligible recruits are being obtained," though it remains to be proved whether the number will increase sufficiently to supply the want which will be created when the short-service men begin to be draughted into the Reserve. This, being translated out of official language into plain English, comes to what we have already said, that perhaps the country may have an army in 1876 and perhaps it may not. If this be "on the whole" satisfactory to the Inspector-General, he must be a comfortable officer to be under. "It remains to be proved," probably, whether the country could lay hand on the men who had gone into this Reserve. The only thing certain is that they will have gone out of the army. The *Times* tells us that this opinion of the Inspector-General is founded on "full returns from the whole army," and we may be sure that the returns are full, although the regiments may be undermanned or the men undersized. If a country could be saved by any application of pens and paper, Britain might defy the world. Colonel Anson has put the matter shortly, and it is to be feared truly, thus:—"We do not pay the market price, and we do not get men; but we pay an inferior price for an inferior article, which would be useless in time of war." The only answer that the *Times* suggests to this disquieting statement is a reference to the Report of the Inspector-General of Recruiting, and to the "authorized

"paragraph" of last Wednesday, and this is no answer at all. The recruit, "though young, of a good stamp," would be useless in time of war, and even if we get the number that is wanted now, it is very doubtful whether we shall get the number that will be wanted two years hence. It is easy to realize Colonel ANSON's meaning by supposing that the duties of the Guards in London were undertaken by these recruits, "though young, of a good stamp." We know that they would be deficient in the qualities necessary to deal with a London mob, and yet we would match them against a foreign army. If boys could do the work of men, Lord CARDWELL was as competent as anybody to arrange how they should do it. But it is idle to plead for further trial of a plan which is manifestly inadequate. No plan can evade the necessity of choosing between largely increased estimates and compulsory service. "To this complexion we must come at last."

FURTHER REPLIES TO MR. GLADSTONE.

IF Mr. Gladstone's Expostulation has produced no other effect, it has at least brought out to the surface the wide division of opinion among Roman Catholics as to the nature and binding force of the Vatican Decrees. While Mgr. Capel insists that all who reject them "make shipwreck of the faith, and *ipso facto* separate themselves from the communion of the Church," the correspondence in the *Times* during the last fortnight abundantly illustrates the statement of "A Roman Catholic" on Wednesday last, that there are many Catholics who, on Mgr. Capel's hypothesis, have, like himself and Lord Camoys, "*ipso facto* separated themselves from the Church," while they continue in the regular practice of their religious duties in common with their infallibilist coreligionists, "treating the new dogma as a dead letter, and considering themselves quite as orthodox as the Pope himself." The fact, indeed, was tolerably notorious before, but it had not been so prominently obtruded on the notice at least of the Protestant public. We may add that Italian ecclesiastics, and even prelates in Rome itself, do not scruple, in conversation with each other and with Protestants, to speak of the Vatican dogmas as not being "*de fide*," because the Council is only adjourned, and is not over; and no doubt all ecclesiastical precedent is in favour of their view. Meanwhile the net result of the controversy evoked by Mr. Gladstone has thus far been very decidedly to confirm the opinion we expressed last week, that while, on the one hand, no practical ground for the publication of the pamphlet has been established—in other words, no reason has been shown for doubting the loyalty and patriotism of the English Catholic body—all attempts to answer the theoretical argument of the writer only tend to prove more clearly that it is unanswerable. Spunking broadly—for there are exceptions on both sides to be noted presently—Mr. Gladstone's clerical critics have chiefly addressed themselves to the latter point, and have conspicuously failed; his lay commentators, beginning with Lord Acton, have convincingly proved the former, which Mr. Gladstone himself did not profess to doubt. Certainly, if it is important to remember that Pius V. excommunicated and deposed Queen Elizabeth, and even commissioned an assassin to murder her, there is more practical significance in the fact, of which Mr. Stourton reminds us, that the Armada, blessed and partly equipped by one of his successors for her destruction, was defeated by a fleet under command of the Roman Catholic Lord Howard of Effingham, while the Catholic nobility generally armed their tenants, and many of the gentry volunteered to serve as privates against the common foe. It is true that Sixtus V., who had a sincere admiration for Elizabeth and detested Philip II. and his policy, had been constrained solely against his will to give a tardy sanction to the enterprise, but this could not be known in England at the time, while his official approval was matter of public notoriety. And a good deal of light is thrown on the present attitude of English Roman Catholics, as loyal and contented subjects, by Canon Oakley, who does not, like his Archbishop and Mgr. Capel, mount the high horse, but addresses his letter to Mr. Gladstone directly, as an old friend, and writes, as indeed he always does, with perfect temper, good feeling, and good taste. Nor have we much fault to find with his studiously moderate interpretation of the Syllabus, except that it is only his interpretation; and even he, if we rightly understand him, feels bound to regard toleration of heresy as "abstractedly opposed to the Catholic theory," though he has no desire to restore the practice of persecution. But he is hardly more happy than his brother clerics, as will presently appear, in grappling with Mr. Gladstone's argument on the real nature and force of the Vatican Decrees.

Why Mgr. Capel should have been commissioned to take up the cudgels in reply to Lord Acton and Lord Camoys is not obvious, unless Archbishop Manning shrank from pronouncing an explicit censure on those "excellent peers" in his own person; though he did not hesitate to go far out of his way to hurl an angry and irrelevant charge, which turns out also to be a wholly unfounded one, at the head of Dr. Döllinger. At all events, Mgr. Capel, though his language is so rash and unguarded as to draw on him a rebuke even from Sir G. Bowyer, adds little or nothing beyond personal comments to what had been said the week before by the Arch-

bishop, unless we are to reckon his implied repudiation of the subtle distinction which infallibilists have been fond of drawing, between the "personal" and "official" infallibility of the Pope, as a fresh contribution to the discussion. We have pointed out ourselves before now that it is a distinction without a difference, and Mr. Capel evidently agrees with us. As to Lord Acton's "atrocious charges against the Holy See," or rather against several Popes, the acts charged are no doubt atrocious enough, but the Rector of a University ought to have known that many of them are familiar to every educated man, and that few living Englishmen are better able to give "the authorities" for any historical facts they may allege than Lord Acton. And, as he called his letter to the *Times* a "preliminary" answer, we presume that he intends to do so. It so happened that the same paper which contained Lord Oamoy's letter contained also a second letter of Dr. Manning's, reprinted from the *New York Herald*, which is more defiantly outspoken than the first. For the Archbishop commits himself to the startling paradox—which, by the way, is implicitly contradicted by Mr. Capel—that Papal infallibility was equally "a doctrine of Divine Faith before the Vatican Council," and "therefore the position of Catholics in respect to civil allegiance, since the Council, is precisely what it was before it." The conclusion is logical enough, but what is to be said of the premises? If Papal infallibility was an article of faith before the Council, it is rather strange that nobody but Dr. Manning should have known it, or should even seem to know it now. Mr. Capel states just the contrary; Lord Oamoy's, Mr. Henry Petre, and Mr. Stourton, names representing three of the oldest Roman Catholic families in England, agree in asserting that they were educated in a different belief, and Mr. Petre is careful to explain that his anti-infallibilist teachers were "the staunchest and most learned bulwarks of the Church"—namely, the Jesuits. To which we may add, without dwelling here on the well-known teaching of Bossuet and the great Church in whose name he spoke, that fifty years ago the entire Roman Catholic hierarchy of England and Ireland, under the distinguished leadership of men like Archbishop Murray and Bishop Doyle, solemnly repudiated this "doctrine of Divine Faith," which is moreover characterized as "a Protestant Invention" in Keenan's *Controversial Catechism*—a work widely circulated under the highest ecclesiastical sanction in England and America, and which has only been adapted to the new state of belief since the Vatican Council by the simple expedient of cancelling the page which contained this statement, and reprinting it with the obnoxious Question and Answer omitted. We must leave Dr. Manning to settle his difference with these high authorities, and meanwhile, until he has done so, his proof of the unchanged nature of the civil allegiance of Catholics falls to the ground. Canon Oakley, who argues that the change from an infallible Church to an infallible Pope is of no practical consequence, sufficiently refutes himself when he insists on the "obvious convenience" of the new *regime*, because the Pope is always on the spot, whereas General Councils are events of rare occurrence, and, as he broadly hints, may be altogether dispensed with for the future. It may be an advantage to transform a constitutional into an absolute monarchy, but the change, whether for better or worse, is nothing short of a revolution. The mention of General Councils reminds us of Mr. Stourton's letter in last Tuesday's *Times*. We have nothing to say against his vindication of Catholic loyalty, or his estimate, which is fair enough, of the character and reign of "Bloody Mary." But he has had the singular indiscretion, alone of Mr. Gladstone's Roman Catholic critics, to raise the question of the moral claims of the Vatican Council as compared with former assemblies held to represent the universal Church. We must confess that we read the following wonderful sentence two or three times over before we could believe that our eyes had not deceived us:—"Never has the slightest suspicion of informality or absence of freedom in debate been raised against the Council of the Vatican." It was open of course to Mr. Stourton to maintain that such suspicions are unfounded, but the statement he has actually made is only intelligible on the supposition that for the last five years he has shared the repose of the Seven Sleepers of Ephesus, till Mr. Gladstone's trumpet-call roused him suddenly from his slumbers. Is it possible he can be unaware that these are precisely the two charges which have been reiterated *usque ad nauseam* against the Vatican Council from every side, by anticipation, during its sessions, and since its adjournment? Has he never heard, for instance, of *Jamus*, or of the *Letters of Quirinus*, both the works of Roman Catholics, or of the host of adverse pamphlets, chiefly emanating from ecclesiastics and members of the Council, published during 1870, or of the successive official protests presented during the Council, signed by nearly all the German and many of the French Bishops, and complaining expressly of the "informality" of its regulations and the violent interferences with "freedom in debate," or of the parting shot fired off by Archbishop Darboy before leaving Rome when the great *coup* had been achieved, *La Dernière Heure du Concile*? We are bound to believe that he knows none of these things, but he would certainly have been wiser to abstain from meddling with a question of all the details of which he is so profoundly ignorant.

We have already avowed our entire concurrence in the trust, expressed alike by the Ultramontane Lord Herries and the Liberal Lord Acton, in the firm and unchanged loyalty of their episcopionists as English citizens. But then we cannot escape the conclusion which Archbishop Manning is so anxious to disclaim, that "they are good citizens because they are at variance with

the Catholic Church," as represented by the Vatican Council. We do not believe that the Vatican Decrees will, in fact, make them one whit less loyal citizens, but to say that there is nothing in the claims authenticated by those Decrees to affect their civil allegiance is something beyond a paradox. To adopt Mr. Petre's very guarded statement, "the claims of the Vatican (that is of the Pope) to supreme and infallible authority over all things pertaining to faith and morals, the limits of which the Vatican alone is to decide, embrace so vast and immense a range, entering into every relation and branch of human life, that we may easily contemplate the power of the Church clashing with the civil authority." Curiously enough the current number of the *Dublin Review*, published just a month before Mr. Gladstone's pamphlet, supplies a striking illustration of the authority exercised in purely civil matters by the Pope in our own day, to which we may call the attention of Sir G. Bowyer, who denies the right of the ecclesiastical power to interfere in questions of civil government. We do not refer to the direct assertion of the deposing power, which the editor of the *Dublin Review* has somewhat qualified in a letter addressed to the *Tablet* since the appearance of Mr. Gladstone's pamphlet, but to passages of much greater practical interest which he has said nothing to modify or retract, though we may justly observe in passing that we cannot comprehend how any one who accepts the Syllabus as infallible can question the deposing power without heresy. In an article directed against the pretensions of the Comm. of Chambord, the reviewer, whom we gather from the letter mentioned above to be the editor himself, constructs an elaborate and forcible refutation of the theory of divine right, or, as he prefers rather quaintly to term it, "hereditism." His argument is quite strong enough to stand by itself, but he has nevertheless thought it necessary to clinch it by what he evidently, and perhaps rightly, assumes will be with his readers, as with himself, the turning-point of the whole controversy. We have taken the liberty of inserting a few italics. "It is to the Holy See of course that the eyes of a Catholic naturally turn, where there is a critical and pervasive question of morals to be solved." In morals, it will be remembered, the Pope has been declared to be infallible. And accordingly the act of Pius VII. in crowning Napoleon is appealed to as next door to "an *ex cathedra* decision against heresim." It finally disposed, for all good Catholics, of the hereditary pretensions of the Bourbons. However, the Bourbons were afterwards restored, and were again overthrown by the July Revolution of 1830, when Louis Philippe was called to the throne of France. And thus an anxious question was raised as to the lawfulness of the revolutionary Government. It was again decided by the Pope. "By the act of directing Catholics to take the new oath of allegiance he (Pius VIII.) declared that the new Government was the *de jure* Sovereign of France: the Sovereign to which all Frenchmen were bound to pay allegiance, under penalty of incurring the severe sentence pronounced by Scripture and the Church on those who rebel against existing powers." It is true that in this case the Pope decided in accordance with modern sentiment and sound sense; but he might have decided the other way, and it would, as the reviewer quite consistently implies, have been equally the duty of all good Catholics to obey him. It was a strictly political question, but it comes under the comprehensive head of morals, and therefore within the sphere of infallibility.

We see no way out of this dilemma except by adopting some such arbitrary delimitation of "*ex cathedra* decisions" as that recently put forward by Dr. Newman, which by limiting them to decrees promulgated "with solemnities parallel to those of a General Council," makes a clean sweep of all former Papal pronouncements except one. Mr. Gladstone has indeed justly styled Dr. Newman "the greatest living theologian of the Roman Catholic Church," but, if Lord Acton cannot be accepted as the "representative of Catholic thought or spokesman of the Catholic body," as little can Dr. Newman be considered the representative or spokesman of Catholic divines. There are at least a dozen other interpretations of "*ex cathedra*" current among them, all of which are more widely received than his, and any one of which of course it rests with the infallible Pope to select and authenticate, whenever he pleases, as alone adequate or permissible. It is very unlikely, as Lord Oamoy's observes, that Pius IX. will emulate the example of Pius V. and excommunicate or depose Queen Victoria, but still "there is no telling what edict might be issued by the author of the Syllabus," or his successors. And it is quite certain that, whatever edict they might choose to issue, every infallibilist would be bound in conscience to obey it. When the Ultramontane "Catholic Union" declares in the same breath its cordial acceptance of the Vatican Decrees and its unchanged attitude in regard to the civil power, it only confirms what we had always believed, that the loyalty of English Ultramontanes is sounder than their logic.

METRICAL TESTS.

THE new Shakspeare Society has lately produced the first fruits of its labours in a volume of *Transactions* containing some excellent criticism and many good promises of future results. One of its most conspicuous features is the application of certain mechanical tests by which it is thought that much greater accuracy may be obtained in some critical inquiries. Enthusiasts like Mr. Fleay appear to hold that the change amounts to substituting a quantitative for a merely qualitative analysis, and, in short, that

criticism conducted by such methods will have some genuine claims to scientific accuracy. Dr. Newman, in the *Grammar of Assent*, draws an illustration with his usual felicity from the case of Shakspearian criticism. He shows how much delicate perception is required before a trustworthy opinion can be formed as to the authenticity of proposed emendations, and how little can be done by applying the coarse tests of formal syllogisms. The hope of some of our new critics appears to be that this difficulty will disappear, and that in a large class of questions the necessity for a fine critical sense will be superseded. Little more will be wanted for settling some perplexing questions than a capacity for counting syllables. Every member of the fraternity who excited Pope's contempt—

Each wight who reads not and but scans and spells,
Each word-catcher who lives on syllables—

will now have his day; and perhaps when the system has been carried into the allied arts, we shall find that the authenticity of pictures attributed to the old masters will no longer perplex the managers of the National Gallery. When Shakspeare's dramas can be judged by the help of simple scanning, we shall surely be able to decide upon Ruffalle by a foot-rule, or at least by some new application of spectrum analysis.

We are very far from denying that this mechanical device has its utility when confined within proper limits. The facts which it brings to light have a real bearing upon important questions, though, when they are known, it requires almost as much judgment to use them as to arrive at conclusions without their help. Mr. Furnivall, who has himself turned them to good account, says very truly that the taste of a highly cultivated and trained reader must always supply the best test; and that counting can never supersede criticism. Making this reservation, however, it is easy to admit that the industry of such gentlemen as Mr. Fleay has provided much useful material.

One application of the test, for example, is to determine the date of Shakspeare's plays. The gradual change of his style led to certain definite external changes in his versification, such as the disuse of rhyme, and the more frequent use of double endings and "unstopt" lines. The change might be recognized in a general way, but there is an advantage in having definite arithmetical statements of results which cannot be due to the fancy of the writer. When Mr. Fleay tells us that there are over one thousand rhyming lines in *Love's Labour's Lost*, and none in the *Winter's Tale*, we have a definite fact dependent only upon the accuracy of Mr. Fleay's counting. When he proceeds to say that the plays can be arranged in four periods, discriminated by the proportion of rhymes employed in each, we may suppose that his argument is not quite conclusive; but when corroborated by other independent tests, it certainly affords a strong presumption, which cannot be so easily rebutted as the simple record of a general impression. The best instance, however, of the application of the method is given in the attempt to discriminate the parts contributed by Shakspeare to *Henry VIII.* and the *Two Noble Kinsmen*. It is satisfactory to worshippers of the greater poet to hear that two very able critics, Mr. Spedding and the late Mr. Hickson, have authorized us to attribute the inferior parts of *Henry VIII.* to Fletcher, and, on the other hand, have claimed the best parts of the *Two Noble Kinsmen* for Shakspeare. The arguments which led them to this conclusion are repeated in this volume; and though it may be premature to pronounce them unanswerable, it may safely be said that they establish a very strong case. Each writer gives an exhaustive discussion, taking into account the style, the general character of the poetry, and the peculiarities of the construction, as well as the more definite peculiarities of versification. Mr. Fleay and Mr. Furnivall then confirm the results by showing that in each case the parts assigned to Shakspeare and Fletcher respectively satisfy their mechanical tests. In the scenes ascribed to Shakspeare in the *Two Noble Kinsmen* there are over forty unstopt lines in every hundred, whilst in the scenes ascribed to Fletcher there are less than nineteen. Conversely, the number of lines with a redundant syllable is much greater in the Fletcher than in the Shakspeare scenes; the percentage of such lines being in the first case over forty-five, and in the second under twenty-nine. The only remark that we need make is that the tests are not entirely independent. The frequency of unstopt lines, for example, was one of the causes which led the first critics to identify certain scenes as belonging to Shakspeare, though they may have felt the result instead of analysing its cause. The case is not really strengthened when Mr. Furnivall assigns the precise numerical value of the argument. He is merely giving a more definite character to the reasoning. When an ordinary observer recognizes a particular handwriting, his judgment is determined by a vague and half-conscious observation of the very same characters which an expert describes in more mathematical language. He observes that one hand is more cramped than another, though he does not measure the size of the loops or the length of the tails of the letters. Mr. Spedding notices that the language of certain scenes is less confined by the mechanism of the verse; and Mr. Furnivall shows by actual counting that there are fewer pauses at the end of the lines. So far as this is the case they are both arguing from the same phenomenon, and should not be reckoned as independent witnesses. When, however, the reasoning is not pushed too far, and when several really independent tests bring out the same result, we may admit that an argument thus backed by reference to unquestionable figures acquires a great cumulative force, and may sometimes be conclusive.

In order to show what value should be attributed to such tests, it will be necessary to check them very carefully, not only by the results of higher criticism, but by such external evidence as can be obtained. The tests themselves must be tested. In the absence of external evidence we can only judge by the harmony of the results which they produce; and we need not say that the external evidence as to the dates of Shakspeare's plays is much less abundant than we could wish. We would suggest, therefore, that it would be worth while for some industrious members of the Society to apply a similar series of tests to some case where a complete check can be obtained, and see how far their conclusions will be satisfactory. We have had the curiosity to try such a plan on a small scale, with the results which we are about to give. It must be premised, however, that, as we cannot profess to be experts in the new method, and as we are still less inclined to boast of an industry comparable to Mr. Fleay's, our figures are given with a certain diffidence, and the investigation, if pushed further, might bring out a different result.

The most favourable subject for the experiment which we have tried is probably Mr. Tennyson. Few readers will dispute that, whatever his other qualities, he is the greatest living master of blank verse, we might probably add the greatest who has appeared since the days of Milton. No one has shown such perfect command of the instrument; and his poems have appeared at so wide intervals of time that we might fairly expect that some such change might be found in his versification as that which took place in Shakspeare's. We have taken ten of Mr. Tennyson's poems, pretty much at random, and will make the allowable hypothesis that this selection is placed before the Mr. Fleay of two or three centuries hence, and that he is required to arrange the poems in order of time, or to say whether they are all the work of one author. Perhaps at that period there might be a tradition that more than one poet had existed of the name of Tennyson, and it would naturally be a pleasing problem for the acute critics of that day to display their acuteness by splitting one man into two. Homer has been subdivided, and a modern author cannot claim to be exempt from the same fate. The only applicable test in this case is that of the stopt line, and we will give in each case the percentage of unstopt lines—that is, of lines where there is no pause at the end—which occurs in each of the poems. We find, then, that in the *Princess* there are 766 unstopt lines in a total of 2,725, or a percentage of 28 such lines. In the first book, however, the percentage is as low as 23.7, whilst in the fourth it rises to 32.6. We may add that we have omitted here and in the *Idylls* the peculiar lyrical blank verse of some of the songs. In *Aylmer's Field* 30 per cent. of 853 lines are unstopt; in the *Ulysses* 33 per cent. of 70 lines; in *Guinevere* 19 per cent. of 678 lines; in *Enoch Arden* 18.7 per cent. of 908 lines; in the *Morte d'Arthur* (in its earliest form) 20.6 per cent. of 354 lines; in the *Gardener's Daughter* 27.4 per cent. of 273 lines; in *Dora* 20.9 per cent. of 177 lines; in *Enid* 20.6 per cent. of 1,857 lines; and in *Lucretius* 31.7 per cent. of 280 lines. Starting from these figures, it may be at once observed that the poems fall into two classes, in one of which the proportion of unstopt lines is about 20 per cent., or 1 in 5, whilst in the other it is about 30 per cent., or 1 in 3.3. The difference, though not so great as that which divides Fletcher from Shakspeare in their joint work, is sufficiently marked to give a distinctive character to the verso. The acute critic might therefore identify the author of *Enid* and *Guinevere* with the author of the earlier *Morte d'Arthur*, where the proportion is identical with that in *Enid*; and would attribute to the same hand *Dora* and *Enoch Arden*. The *Gardener's Daughter*, *Ulysses*, *Aylmer's Field*, and *Lucretius* would, on the other hand, belong to the author of the *Princess*. The higher criticism would show that it was easy to detect a very different tone of sentiment in the two classes; and that a greater complexity of thought, corresponding to a more elaborate structure of sentence, distinguished the *Princess* from the Arthurian idylls. The resemblance, it might be argued, is great enough to indicate perhaps some family relation between the two Tennysons; but not to overpower the evidences of distinct authorship. If, on the other hand, it was admitted that the same hand had written both series, the difference would then correspond to different periods of the poet's development. An arrangement according to the test would give us the following order:—*Ulysses*, *Lucretius*, *Aylmer's Field*, the *Princess*, the *Gardener's Daughter*, *Dora*, *Enid*, the *Morte d'Arthur*, *Guinevere*, and *Enoch Arden*; or if, on the Shakspearian precedent, the simpler were supposed to precede the more complex structure, the order would be reversed. We need hardly point out that in either case the order would be entirely different from the actual order of publication; and that pieces which appeared in the earliest volume that contained blank verse would alternate in complete confusion with some of the poet's latest productions.

So far, then, it would seem that the result is purely nugatory, or, if anything, tends to discredit the efficacy of the method. It was not indeed to be expected that Mr. Tennyson's system of versification should go through a process of development analogous to that of Shakspeare's. All that we have proved, if our results are correct, is that Tennyson's change of manner does not lend itself to this particular mode of investigation. The varieties which he presents correspond to differences in the sentiment which he is expressing, and not to any progressive difference in the writer's system. When representing the passion of *Lucretius*, or writing with the comparative freedom of the *Princess*, his cadence is more broken and varied than when he adopts the rather constrained purism of the *Idylls*.

All that we appear to have shown is that the difference between these moods is capable of some sort of arithmetical expression, and thus a difference of which every one is sensible when reading can be made palpable to the senses by this rude kind of critical dissection. We can easily imagine cases in which this result would have some value; but it is also clear that it would be possible to press it into the service of very erroneous theories, and consequently that the method needs to be carefully checked by other faculties than the calculating

BRESCIA.

THE last strictly Italian city of which we spoke was Como. A roundabout, but highly attractive, journey by lake and railway will lead us thence, without passing through mightier Milan, to another city with whose place in Italian and general history that of Como may be compared and contrasted. As a city, Brescia ranks far higher than Como; it does so even now; much more so did it in the days when it was looked on as a rival to Milan. And the direct part which Brescia has played in history has been incomparably more important than that which has been played by Como. If its wrongs were not made the pretext of such mighty movements as those which sprang out of the earlier and the later wrongs of Como, the doings and the sufferings of the city itself are far more prominent and important. Brescia played her part as an important member of the Lombard League, and her name and the effigies of her citizens were set up by grateful Milan over the gate which recorded her rebuilding, partly by Brescian hands, after her overthrow by the later patron of Como. Prominent as Brescia thus was in opposition to the claims of Frederick, she appears as no less prominent in withstanding the last of his successors whose Imperial claims were other than a mockery. The city stood a siege at the hands of Henry of Luxemburg, and if her own chief Tobaldo Brusati died by what some called the cruelty and some the justice of the Emperor, his loss was avenged by the death of Henry's own brother Waleran, in the struggle beneath her walls. In later times, when Brescia, like so many of her sister cities, had passed under the dominion of St. Mark, we find her the centre of the strongest resistance to the powers which leagued together to wipe out the wise aristocracy from among the ruling elites of the world. The name of Brescia may be familiar to many who have but vague ideas of Frederick of Swabia and Henry of Luxemburg, because there the knight "without fear and without reproach" gained himself the praise of superhuman virtue by not playing what amongst honest men would be called the part of a superhuman scoundrel. That Brescia fell from her old place was largely due to the havoc and massacre of her French conquerors in a warfare as unprovoked and inexcusable as any in which French conquerors ever engaged. The blood of Avogaro, shed at the bidding of Gaston of Foix, could more rightly cry for vengeance than the blood of Brusati shed at the bidding of Henry the Seventh. What was, from his own point of view, a deed of stern justice at the hands of the lawful King of Italy sinks into simple murder when it was done simply to glut the pride of an unprovoked invader.

Brescia then is a city which has lived a life in the very thick of Italian history, while Como has, so to speak, lived only on its outskirts. The contrast is marked in the position of the two cities. Both lie on the northern frontier of Italy, at the foot of her great mountain bulwark. But they look different ways. Como, in her valley, by her lake, looks northward, as if opening her arms to welcome the Teutonic King who comes to her relief. Brescia, not lying in an Alpine valley, but with her citadel perched on a spur of the Alps themselves, instead of turning away her eyes from Italy to the north, looks down upon nothing short of Italy herself. The view from the castle of Brescia is indeed a noble one. And it is not a mere noble view; it is a view on which the characteristic history of Italy is legibly written. It may almost remind us of the famous letter of Sulpicius to Cicero. With a single glance of the eye we look down on a crowd of cities, each of which once was an independent commonwealth, with its name and place in history. On one side are the spurs of the Alps on which we are standing, reminding us that there is a land beyond, from which Emperors came down to demand the crowns of Italy and of Rome. To the far east we get a glimpse of smaller hills on the extreme horizon, suggesting that the natural ramparts of Verona are not beyond our sight. But to the south the eye ranges over the boundless plain of Lombardy, spreading like a sea, with a tall tower here and there, like the mast of a solitary vessel. Each of those towers marks a city, a city which once ranked alongside of princes, cities making war and peace, and containing within their walls the full life of a nation. The map seems to show that one of them is the mighty tower of Piacenza, and that another is the yet mightier tower of Cremona, the fellow-worker of Brescia in the great work of restoring Milan. But we look out on even more than this. We have vividly brought home to us how near the great cities of Northern Italy lie to the Alpine barrier, the barrier which was so often found helpless to shelter them against the Northern invader. We think of all the conquerors who have crossed the mountains from Hannibal to our own day. And we go back to times earlier still, when the land which became the truest Italy was not yet Italy at all, when the Po was as truly a Gaulish river as the Seine. If the Alps themselves proved so feeble a barrier for the shelter of Italy, how far more feeble was the barrier which sheltered Etruria and Rome, when what is now Northern Italy

was still Gaul within the Alps! From such a point we may well run over the shifting fates of the land before us from Brennus to either Buonaparte. And, as our thoughts flit on beyond Po and Macra and Arno to the seven hills by the Tiber, we may feel thankful that the dominion of the last invader has become as much a thing of the past as the dominion of the earliest.

Yet, though the great historic view of Brescia lies to the south, it may be well for him who stands on that height to turn his eyes to the north also. There is an aspect in the history, if not of Brescia, yet of the most renowned man of Brescia, which makes us look alike northward and southward, which makes us span the space which lies between the Tiber and the Limmat. If Como looks beyond the Alps for her own deliverer, Brescia too looks beyond the Alps, not for a deliverer for herself, but for a place of shelter from the citizen whom she sent forth to deliver others. In the life of the Brescian Arnold his native city seems like a halting-place between his city of refuge at Zurich and his city of glory and martyrdom at Rome. We need not be harsh on either Pope or Emperor, in whose eyes a republican reformer could hardly fail to bear the guise of a heretic and a traitor. On the heights of Brescia we feel, as we look Romeward, a regret that it was at Swabian and English hands that he met his doom. But, as we look northward, we may feel comfort that it was a Teutonic and Imperial city which sheltered the man who, if he took his memories for hopes, could yet call back for a moment the days when Rome had not to seek her master either in a German King or in an English Pontiff.

The view of the city itself on which we look down from the castle is hardly worthy of the general landscape of which it forms a part. Its look is indeed striking, but hardly more so than that of any city of decent antiquity must be when it is looked down on in such a way. But the view of Brescia does not send up any object on which the eye at once seizes as something specially to dwell on. There are towers and cupolas; but there is no tower or cupola which kindles any very strong desire for a further acquaintance. And, as we walk the streets, there are fewer attractive buildings, whether ecclesiastical or domestic, than in most Italian cities. Yet Brescia by no means lacks objects deserving study. Only the chief antiquities of the city lie somewhat hid, and have to be looked for. The most striking when we come near to it, though it necessarily makes no show in the general view, is the *duomo vecchio*, the old cathedral, the famous round church of Brescia. The new cathedral by its side is a building of no importance; but it is at least to the credit of its builders that they left the old one standing. Had the same discretion been shown in some other places, we should have many more monuments of early times than we have. But if the round church has not been destroyed, a vast deal of labour has been spent on the characteristic work of spoiling it. The upper round, the clerestory, has not been seriously meddled with, and it still keeps the majesty of its circular outline, having a far greater effect of spreading massiveness—the proper effect of a round building—than any of the round churches of England. But the lower range has been sadly tampered with, and the inside has suffered from the process which the English translation of Budeker calls "painting the pillars to resemble columns." This is not very clear to the English reader, but, as in some other English translations of German books, the meaning may be guessed by stopping to think what the German original must be. The round rests on massive square piers, in German *Pfeiler*, and the whole has been, like St. Vital at Ravenna, bedaubed to imitate Renaissance architecture. This makes the general look of the inside sadly disappointing. But the disappointment begins to vanish as soon as we make our way underground and see the spacious crypt, with the endless variety of its columns and capitals of all manner of forms, some of them clearly classical ones used up again. This crypt proves that the round church of Brescia had, as all our round English churches have at present, a choir projecting to the east, but the choir to which the crypt belonged has made way to a late building on a much larger scale. There is also in Brescia a Romanesque church of the basilican plan to match the round one, but this has emphatically to be looked for. Within the range of the extensive buildings which go by the common name of St. Julia—a suppressed monastery, now part, it would seem, to various uses military and municipal—are three churches. One of these, Santa Maria in Solario, a square Romanesque building with an octagon top, shows itself in the street, but, unlike the usual rule of Brescia, the inside, except the crypt, hardly fulfils the promise of the outside. In truth, a small building of this kind, where there can hardly be any columns, allows of but little scope for display within, unless, like the buildings of its class at Ravenna, it is covered with mosaics. Far more important than this is another of the same group, San Salvatore, attached at a lower level to the worthless church of St. Julia proper. Here, when we penetrate to it, we come to a genuine church of the basilican type, which to some travellers may chance to be their first specimen of that type. Two ranges of columns above and a crypt below exhibit the usual features of buildings of this class, columns with capitals of various kinds, classical and other, ranged as happened to be convenient. Every building of this kind has its interest, and to some it may happen to be the first foreshadowing of its more stately fellows at Ravenna, at Lucca, and at Rome.

But the chief attraction of Brescia is hardly to be found in its churches. Had it been left uninjured, the great *Broletto*, in much the same style as the smaller one at Como, and like that,

hard by the *duomo*, though not actually touching it, would doubtless have claimed the first place. And its historic interest is not small, as it was round this spot that the fight raged most fiercely when Brescia had thrown off the heavy bondage of the Gaul to return to the lighter yoke of the Serene Republic. But the building is sadly disfigured; its blocked windows merely peep through to show what they were. On the whole, the first place among the antiquities of Brescia must be given to the museum, formed out of an excavated temple. The remains of the building itself, the stately columns of its portico which still survive, are striking in themselves, and they supply one piece of detail which is interesting in the history of architectural forms. The columns do not form a continuous range, but the portico has projections in front. The angles have thus to be provided for, and they are provided for by forestalling, in the architecture of the days of Vespasian, the section of the mediæval clustered pillar. Within, in the restored triple *cella*, is a whole store of antiquities, classical and mediæval. The gem of the collection in an artistic point of view is doubtless the figure of Victory, of Greek workmanship; but more light is thrown on Brescian history by the long series of inscriptions ranging from the first Imperial days to Gratian and Theodosius, and by the other long series of architectural details, classical and Romanesque, from the destroyed buildings of the city. The library too is rich in treasures, though we cannot forbear the remark that almost too much liberality is shown in the ease with which strangers are allowed to examine them. Experience may perhaps have shown that only people with a praiseworthy object are likely to seek for them at all; otherwise an ill-disposed person might easily damage, or perhaps even carry off, some of the smaller objects. But there they are; precious manuscripts of various dates, jewelled crosses, carvings, and an object which, if we were right in our reading of it, is of surpassing interest. This is a consular diptych, bearing the name of Boetius. This is a relic indeed, though it would have had a more melancholy interest still, if it had been found at Pavia instead of at Brescia. At Ravenna we would fain not be reminded of the one crime of the reign of the prince under whom Rome and Italy were happy.

Such are a traveller's impressions of Brescia. It is a witness to the amazing historical wealth of the Italian cities that a place like this, which has so many memories and so much to show for them, can hardly, in an antiquarian point of view, claim a place above the third rank.

PLAIN COOKS.

WANTED, an industrious, thrifty, sensible woman, who has some idea of cookery, who will do a little housework, clean her knives, and be content with the wages of a governess. The servants who now apply for such situations in middle-class households are for the most part wholly unfit for them. Sometimes they are kitchenmaids who have been under good cooks, but have been too lazy or too stupid to learn from them, and, being generally without any ambition to rise in their profession, they have abandoned all hope of ever earning high wages. Sometimes, again, they belong to a class of which the young or inexperienced housekeeper must beware. Its representative is usually an elderly woman of many places, who is destined to be in many more; indeed she adds to their number almost every month, for drink, or laziness, or both, will account for any frequency in her migrations. A third and more numerous class is that of the young woman who has been a maid-of-all-work. She has been ignorantly brought up, and her home training has been worse than none. She has seen waste when money and provisions were plenty, alternating with starvation, begging, and dishonesty when scarcity of work and drunkenness have made times hard. She has inhabited a crowded room where tidiness was impossible; her dress has consisted chiefly of rags, garnished with artificial flowers; her highest ideal of amusement has been a fair or a music-hall; and her only preparation for entering domestic service a few months at nominal wages in a lodging-house. There she has learnt little but peculation, and has been accustomed often to lie down at night in her clothes too weary to undress, and to rise in the morning and go about her work unwashed and uncombed. When the maid-of-all-work obtains a place as plain cook she assumes the reins of office with perfect self-satisfaction. She proceeds without any hesitation to waste and destroy the materials entrusted to her for conversion into food. It need hardly be observed that her success is complete. She keeps her milk and cream in the hot kitchen and wonders that they turn sour. She puts the butter into the same small cupboard with the cheese, and is surprised that the sauce which she sends to the dinner-table has an unpleasant taste. She will not be at the trouble of cleaning out the oven-flues, and cannot imagine why the paste will not rise. She leaves the fish upon the kitchen-table from the time it is brought until she is ready to cook it, and stands by with a look of innocence while the fishmonger is scolded for sending stale fish. When she lays a fire she crams it with bundles of wood so that it will not light, and supplements her bad architecture with whole boxes of matches and very long candle-ends. She stirs the kitchen fire every time she passes it, and keeps it blazing even when there is no cooking to be done, and when the family is dining out. If the heat makes her ill, she blames the poor accommodation of the house, and talks as if she had come from a palace to enter service. If she has a gas stove the taps are constantly turned on,

and as to lowering the lights in the passages or scullery such an idea never crosses her mind even in dreams. She will send up the eggs either raw or hard boiled rather than use your sand-glass. She will give you bread and milk with roast chicken rather than beat and flavour the mixture into bread sauce. She will make tea with tepid water, will send up spinach that looks like cabbage rather than put it through a sieve, and will peel the potatoes an inch thick to save the trouble of picking out their eyes.

Now really refined cooking is the result of practice and teaching. But, short of this, the genius which consists of "an infinite capacity for taking trouble" will do much for the production of food which shall be wholesome and palatable as well. This is exactly the quality deficient in an ordinary cook. Flavouring, frying, and making puff-paste are not to be learnt in a day, though common sense and the will to use it are enough for the preparation of an ordinary dinner. But the contemporary cook has only one recipe for every dish—namely, quantity and waste. She asks for a dozen eggs and a pint of cream for the simplest cabinet pudding, and prefers isinglass to gelatine only because it is more expensive. A whole pot of jam must be consumed to make a single tartlet. A joint in the kitchen and another in the parlour is the allowance she prescribes for every day. She never keeps gravy; it is mean to boil down bones and scraps. If gravy is wanted, gravy beef should be ordered. The rind should be cut off the bacon at least an inch thick, and a crock of broken bread must always be kept to get mouldy for the honour of the house. Frying can only be done in lard in any respectable kitchen, and what number of oysters are required for a single patty we do not venture to estimate. Untidiness, too, the constant companion of wastefulness, she has reduced to a science. Her cupboards are an alarming mixture of scraps, sauces, forgotten whites of eggs, and pots of dripping, together with raisins and cornflour, furniture-polish and blacklead.

Her destruction of articles of food is well matched by her treatment of the crockery and kitchen utensils in her charge. She warns the best china dinner-plates to a white heat. The dishes she puts into the oven, until their surface resembles that of the crackle porcelain admired by collectors. If they are adorned with arms or monograms in colour and gilding, she early discovers the efficacy of strong soda and soft soap in the removal of such vanities. A few dexterous movements will chip the edges on a stone sink, and she thinks it well to remove such excrescences as the handles of dishes or the tops of their covers; her reasons for these measures may be sanitary, as handles only form recesses for grease and dust, and it is impossible to clean them without trouble. Pudding basins she consumes in large numbers, and uses butter-boats to feed the cat. The dishes she sends to table invariably soil the cloth, and are so full of gravy that they often spill on the way upstairs. The covers are smeared with greasy finger-marks, and it is well if the outside only is dirty. The kitchen is her fortress; from it drawing-room company is carefully and jealously excluded. In all families the children look upon the kitchen as a paradise of dainty devices. In some they are never allowed to enter it; but in others the little missy is sometimes privileged to make a bit of paste into ducks and drakes, or to knead some dough into a cake for the doll's birthday. Such frivolities a modern cook sternly represses. She supposes the young ladies will want to make puddings next or to come down and try recipes out of "them rubbishy books." She has no notion of encouraging such pranks. A favour has to be made of leave to use her bowls and spoons, and the young officer just home from his regiment dare not venture into the sacred precinct to concoct a red Indian curry or a Mulligatawny pillow unless he has first ascertained that cook is in a good humour. Even the lady of the house is informed very plainly that after her morning visit she is not expected to disturb the quiet of the lower regions. The trap is always missing from the kitchen sink, and things run into the drain which should never go there; the valve itself disappears among the ashes, and is carried away by the dust-cart, together with the stoppers of sauce bottles, the heads of pepper-casters, jam-pots, and half-burnt coals. Indeed one might think that the cook had a personal interest in the dustman, and wished to bestow as many useful articles upon him as possible; or perhaps her benevolent feelings are stirred by some tale of the poor sorters in the cinder yards to whom these things are perquisites, and she would be charitable by proxy. She has a kind heart for all sorts of tramps, and frequently has her fortune told. The woman whose babies seem endowed with a perpetual youth, the man who sells pencils, the various folk who seek out a precarious livelihood by hawking mittens, combs, and pen-wipers, find in her a sympathetic patron, and draw from her large supplies of her master's bread and meat. A carrier, whose pony was more sleek and well fed than carriers' ponies often are, confessed on one occasion that he obtained from the tramps in his neighbourhood their stores of crusts at one shilling a peck:—"Sometimes I am almost inclined to pick out the pieces of cheese and meat, but Jack here eats it all up as sweet as can be, and his coat's like satin."

Her personal habits accord with her domestic and social qualities. She labours under a chronic hydrophobia, for though her thirst is unquenchable she carefully avoids cold water. Copious draughts of beer, occasionally varied in the afternoon with tea, and in the evening with gin, assist her in her work and support her exhausted frame. Personal ablutions she does not affect, but wipes her hands usually on the tablecloth, or whatever else is within her reach. Pudding-cloths are convenient for the purpose, and become so saturated with various animal oils, butter, fat, and lard, that they are devoured by the mice which, with flies, kittens, and

blackbeetles, constitute the *fauna* of the kitchen. A small piece of broken looking-glass on the dresser enables her now and then to smooth her hair, the usual appearance of which suggests the occasional but scanty use of the blacking-brush. The chief efforts of her toilet upon week-days are made for the advent of the butcher's boy, but she is not given to wasting time in the decoration of her form. All her powers in this line are reserved for Sunday, when she turns out, as she confidently believes, quite the lady, her whole earnings being spent on the display, for she never saves out of her wages, and seems to live in the quiet expectation of a handsome legacy or a wealthy husband. Perhaps it is to this end that the hair, so untidy on Saturday, is now braided into shining rolls; the hands, yesterday so grimy, are covered with green leather gloves; the feet, which all the week have only worn slippers, are encased in tight and high-heeled boots, decorated with arabesques; and, to her great delight, she fondly thinks there is nothing of the cook about her. Those who have to submit to her professional shortcomings may think there is no more of the cook about her on week-days. She despises her occupation, and can hardly therefore be expected to succeed in it. She looks upon her mistress as an unreasonable being, full of whims and fancies, which it is her painful duty to evade and thwart as often as possible. She explains to her young man, for cooks are never without sweet-hearts, that her people are a mean lot, that they buy from the Civil Service, make soup of distracted meat, and cut irritated bread, and that she means to give warning immediately.

LAITY v. CLERGY.

THE division of Englishmen into clergy and laity has been of late brought somewhat prominently into view by the press. In the existing and impending deluge of vague ecclesiastical talk, which, disdaining and bursting its modest channel of the Sunday suburban midday dinner-table, now threatens to flood Parliament, and society for an undefined period, the division is no doubt convenient as a form of speech, and is likely to pass current as representing a form of thought. The terms are already used as absolute, and the division treated as exhaustive. That the surface of the globe, as we learnt at school, is divided into land and water; that the human race, as we were taught in our freshman's year, is made up exclusively of "men" and "cads," are not propositions more entirely expressing facts in the order of nature, it would seem, than the clerical and lay distinction.

It is not therefore in any spirit of cavilling or presumption, but simply with a desire for accuracy of thought and clearness of expression, that we venture to suggest the inquiry, What is a layman? Into the higher and more abstruse aspects of this question we are not now prepared to enter. That there is an ideal or type of the order known as "the average layman" is so commonly taken for granted that he must be presumed to exist; and it is further presumable that the gentlemen who speak and write so fluently about him know what or who he is. An average, it is commonly believed, requires in the first instance a sufficiently wide induction, and in the next a careful and scientific comparison. The "average layman" must thus be discovered by means of a classification of the individuals comprised under the term, followed up by the separation, weighing, and measurement of that special quality, element, nerve-force, or whatever it be in each which is essentially and exclusively lay. Thus, as Dr. Lynn tells his audience, "You see how it is done." But, apart from this anthropological mystery, a preliminary doubt may be raised, and deserves some attention, whether there really is any such organized existence as a layman absolute and *per se*. The notion of a layman *ad hoc*, or a relative layman, is perfectly intelligible and familiar. Such a doubt is clearly not to be solved or met by any mere etymological or archaic considerations. The term "laic" may have borne, and probably did bear, a distinct meaning in the fourth century A.D., just as the term "Liturgy" may have done at Athens in the fourth century B.C.; and the one may be as little to the purpose in any question of modern interpretation as the other. Without raising the point whether a Peer Spiritual could properly be described as a "lay lord," it is evident that the latter term does not mean the same thing as a Temporal Peer, and the opinion of a person in holy orders, episcopal or other, upon a point of law would correctly be described as a "lay" opinion. Independently, however, of such technical subtleties, and assuming any person outside the clerical order to be in theory a layman absolute, it may be also taken as admitted that no one in practice uses the term, any exhaustive division notwithstanding, without some very large limitations. Mr. Bright's residuum, although they be Mr. Gladstone's flesh and blood, may be taken at once as excluded. Peers, squires, churchwardens, and vestrymen are equally of course within the defining line. But then there is such a great intermediate class. Is a verger, or a railway guard, or the prophet of a sporting newspaper, a layman in the sense known to the *Times*, or not? Because, when we come to discussing the introduction of "the lay element" into Convocation, it is really desirable that we should know to some extent what we are talking about.

No such difficulty of definition attaches to the correlative term, or second branch of the exhaustive division, whichever we choose to call it. By the clergy, for all current purposes of ecclesiastical conference, disputation, or talk in general, is meant one distinct and separate body of men in England. And it is commonly

assumed by a good many of our public instructors in the press, and believed accordingly in a hazy kind of way by a considerable portion of their audience, that between this body and that other sound-hearted, intelligent, powerful, if slightly vague and indeterminate, whole known as the laity, there exists a pronounced divergence, not to say a direct opposition, of aims, motives, interests, and all the rest of it. Polished editorial periods in London, and the downright hammer-and-tongs articles which issue from Leamington for the moulding of the agricultural mind, come upon this head to very much the same thing in the end. Suppose for a moment that all this declamation were based on sound statistical evidence, and that the issue were about really to be fought out, after the modern English fashion, in a general campaign of public meetings, with each side turning out all its available forces on the stump. In a fair trial of free speech, for perception of points at issue, for calumnies in argument, for reasoning force and debating power, a comparison of the respective qualifications of the so-called lay and clerical minds would probably produce results both instructive and interesting. But society is likely to have some time to wait before any such results are published. The antagonism between the lay mind and the clerical mind cannot easily be marked and measured under the existing conditions of applied mental science, because, among other reasons, the method of comparison between things non-existent is a problem which has not yet been solved. The "lay mind," like the "average layman," is supposed popularly to exist in some sort of reference to the clerical mind and the average clergyman; and consequently, in the language of mathematics, if $x = 0$, y is impossible. If the "clerical mind" is an expression which conveys no sort of intelligible meaning, there can be no need to take much trouble in ascertaining what the "lay mind" may chance to be. That there may be in the higher ranks of the clergy a particular type of character and habit of thought is very possible. The episcopal type of mind is an expression which may be easily understood, and which may, for all we know, have a reality corresponding to the idea, existing possibly in less perfect development under decanal or capitular forms. But so, and in exactly the same way, there may exist a judicial type of mind; and perhaps a type representing the mind of permanent heads of Government offices. Any small and select body of men holding positions and exercising functions of exactly the same nature, and officially raised above the ordinary level of society, may very naturally fall into a sort of mental groove of similarity. Whether the possession of the office predisposes to the habit of mind, or the mental constitution has prepared and indicated the individual for the office, is a question which may be left to the philosophers. The existence of an episcopal type, if there be such, proves at any rate nothing about the existence of a clerical one.

There is, indeed, a type of mind which may be described generally as the ecclesiastical, and which admits of a good many varieties. It is very probably the confusion of the two distinct terms, ecclesiastical and clerical, joined to the familiar experience of divergence in the ecclesiastical varieties, which has prepared the way for most of the nonsense which we hear and read about the present and increasing antagonism between clergy and laity. Every one who is capable of thinking, and who has taken the trouble to think at all about the religious phenomena of this century, knows well that there is no variety of the ecclesiastical type of thought which has not exhibited its most pronounced, not to say exaggerated, forms in men not in holy orders at all. The half-pay officer who holds a Revival meeting in a watering-place occupies as a rule a far more advanced position in the "emotional" ranks than the Low-Church preacher of his choice; while in the opposite direction of the English Church Union it is well known that non-clerical partisan zeal often distances all clerical efforts to keep it within bounds. If anything further were wanting to exhibit the absurdity of confusing the ecclesiastical idea with the clerical, it would be shown by the fact that much of what is thus popularly described as clericalism is most conspicuously developed in the sex which is "not suffered to teach in the Church."

It is no doubt true that a good many clergymen both feel and manifest much intolerance of the presence of Nonconformists within their official radius; and as the squire, the doctor, and the colonel, to say nothing of the farmer or the retail tradesman, suffer no corresponding disturbance of mental equilibrium from this cause, such intolerance is constantly taken to be a "note" of the so-called clerical mind. It has obviously nothing to do with it. The squire has precisely the same kind of objection to a poacher, or, in a modified form, to the manufacturing parvenu who has made a sufficient fortune to flout him into the commission of the Peace; and if he and his brother the rector had chanced to change places in the order of their birth, each would have naturally adopted the antipathy which a similar habit of mind has directed to the object lying for each in his own special path of life. The colonel objects to civilian interference in military matters. The doctor has not much love for the unlicensed practitioner; and the retail tradesman has "no connexion with the establishment over the way." It would be easy to multiply illustrations to show, point by point, that what is so commonly described as the "clerical mind" has no sort of existence in fact, but that it is very often only a phantom constructed out of a confused generalization from misunderstood instances. More frequently indeed the process of reasoning, or what passes muster for reasoning, is of a very much simpler kind. An individual clergyman says or does something, or is reported in a newspaper to have said or done something, which somebody else, being concerned in the matter, or more probably having nothing

whatever to do with it, is pleased at the moment not to approve. The clergyman may be in the right or in the wrong as it happens; but the chance conflict of opinion between the two individuals, clerical and non-clerical, is quite enough to establish a case for the existence of the "clerical type" of mind, and to form the basis for some very large generalization about an essential antagonism between the clergy and the laity. Talk of this kind is not the less mischievous because it is nonsense, seeing that nonsense clothed in sounding verbiage goes a long way in the world. The only sort of real, existing, *bona fide* antagonism between the two classes of which any evidence that we are aware of has been produced in recent periodical literature is found—and thus much we must in honesty admit—under the heading "Clergy v. Laity" in the current number of the *Haileyburian*, where we read that "The laity kicked off, and proved much too strong for their opponents, driving them back in every scurramage"; but ultimately "the clergy had the military added to their side, and" from that time "had slightly the best of it." That is about the measure of class antagonism which exists between the "scurramagers'" fathers at present, or which is likely, when the boys have taken their fathers' places, to exist between themselves.

EPPING FOREST.

THE Master of the Rolls, in giving his decision on the question of the common lands of Epping Forest, expressed himself very plainly as to the conduct of the defendants. "What some of the defendants," he said, "had done was to take away other people's property without their consent, and to appropriate it to themselves." We are sufficiently familiar with this method of transferring property—"convey, the wise it call"—in the case of such things as purses and watches, but it is happily not every day that an attempt is made to appropriate three thousand acres of land in this simple and summary fashion. It is true that the defendants acted under the guidance of their legal advisers, and it may be assumed that they had persuaded themselves that they had somehow a right to what they seized upon. Delusions of this kind in regard to smaller and more portable articles are apt to lead to unpleasant personal consequences, but in this instance the persons who have been helping themselves to other people's property will suffer no further inconvenience than that of having to give up a part at least of their plunder. Twenty years being the limit within which restitution is demanded, appropriations made before 1851 will remain in the hands of those who hold them. The Master of the Rolls also made some strong remarks on the manner in which the defendants had conducted their case. The issue, he said, was a very simple one, and all the materials required by the Court for deciding it might have been furnished at a comparatively small cost. The defendants, however, had endeavoured to support their title "by a large mass of evidence which must be wholly discredited," and had added enormously to the expenses of the suit. It is satisfactory that the defendants are now to be compelled to surrender what they had illegally appropriated, but it is important to observe that they seem to have had every prospect of being left in peaceable possession of their plunder, and that it is only by a series of accidents that the Forest has been saved.

Mr. Lefevre's letter to the *Times* gives an interesting and instructive history of the progress of litigation in this case. For a long period there had been nibblings at the Forest, but it was not till about 1865 that the Lords of the Manors began their wholesale appropriations. A Committee of the House of Commons had just then been inquiring into the general question of the best means of preserving for the public use the forests and commons near London, and had come to the conclusion that the rights of commoners were amply sufficient to keep commons open and unenclosed. This rather alarmed the Lords of the Manors, and many of them took the opportunity of putting themselves in the advantageous position which is acquired by the actual possession of contested property. They had previously regarded the common lands as property which they might some day or other enclose when it suited their convenience; but they now thought to make themselves sure of it by enclosing it at once. Sir Thomas Wilson began his operations upon Hampstead Heath; the late Lord Brownlow added five hundred acres of Berkhamstead Common to his private park. Queen's College, Oxford, similarly, under the advice of its solicitors, seized upon two important commons and a smaller one in the South of London. Epping Forest was also pounced upon, and large parts of it enclosed. It was fortunate for the public that the Lords of the Manors did not show greater moderation and forbearance. If they had been content to go on gradually, taking in a little bit here and a little bit there, now insidiously advancing a fence in one quarter, or building a house in another, their depredations would perhaps have attracted little attention, except in the immediate neighbourhood of the places where they were committed; and from mere local opposition they had little to fear. When, however, it was seen that they were swooping down on open spaces in all directions, and that very soon, unless they were checked, London would be almost stripped of the noble belt of heaths and commons which had so long been her pride, and which in a sanitary point of view had now become a necessity to her inhabitants, a strong feeling of indignation was excited, and a number of persons had sufficient public spirit to come forward in defence of public rights. One night Mr. Augustus Smith

sent down a couple of hundred labourers from London in a special train to remove the strong iron fences with which Lord Brownlow had cut off part of Berkhamstead Common, and before morning the hurdles were all laid decently in a heap. In the suit which followed, the appropriations were declared to be illegal. After this Queen's College and other Lords of Manors deemed it prudent either to surrender claims which they could not enforce at law or to come to terms either with the residents adjoining the open spaces or with some public authority which would undertake the charge of them. In this way the commons at Plumstead, Bostall, Dartford, Tooting, Wandsworth, Wimbledon, and elsewhere have been preserved for the use of the public. Hampstead Heath was obtained only by a costly compromise, into which the inhabitants were driven by the prospect of protracted litigation.

In all these cases there was an important body of influential residents on the side of the public, and this naturally facilitated a settlement. At Epping, however, a large proportion of the resident landowners were in favour of enclosure. They had no relish for the wanderers from the East of London who came to spend their holidays in the Forest, and who did not always make themselves too agreeable during their stay; and, on the other hand, there was the temptation of getting a slice of the property, if it were divided. Accordingly, there seems to have been a general rush at the Forest pretty much in the spirit of the old saying, "Every man for himself, and the Devil take the hindmost." The Devil has indeed turned up in the form of the Court of Chancery, and those who were last in the race of spoliation will now have to disgorge; while those who were lucky enough to secure their share of the plunder before 1851 will be left to the enjoyment of it. It appears that in the course of the last twenty years 559 illegal enclosures have been made, and some of them have already been cut up for building ground, and are covered with houses. What it is important to observe is that all this property and more would have passed permanently into the possession of persons who had no legal right to it whatever, if it had not been for the accident that the Corporation of London happened to hold some ground within the limits of the Forest for the purpose of a cemetery. This gave the Corporation power to interfere on the ground that the enclosures were a violation of its rights of commonage; and the Corporation, being a rich and powerful body, has been able to make head against the Lords. At one time, it seems, before the intervention of the City, an old labouring man at Loughton was left alone to struggle against the Lord of the Manor. He had been in the habit of exercising an ancient customary privilege of lopping trees for firewood during the winter months, and when this was forbidden he refused to submit. He persisted in cutting wood, and urged his neighbours to do the same. Two of his sons and a nephew, who were found lepping, were summoned before the magistrates, one of whom had received a large share of the Forest, and were sent to prison for a week with hard labour. The old man obtained assistance to try the question at law, and, in spite of attempts made, now to buy him off, now to drive him out of the parish, so as to deprive him of his *locus standi*, the suit was kept going till it was interrupted by his death. Here the question would probably have ended if the Corporation had not been induced to take it up, and it was only through its being the owner of a cemetery in the Forest that it obtained a right to interpose. It is well that the Forest has been saved, but it is not comfortable to reflect that the chances were all the other way.

The whole subject of enclosures is one of great importance, and it is to be hoped that the Amending Bill of the Government, which is understood to be in preparation, will treat it in a thorough and comprehensive manner. The same sort of questions which have been raised during the last few years in the neighbourhood of London are also springing up in other parts of the country, and it is desirable that some distinct principle should be laid down by which the rights of proprietors on the one hand and of the public on the other may be equitably maintained. The difficulty of the matter is of course mainly due to the fact that the idea of a general public with any interest in the commons is entirely a modern invention. Formerly a common was an object of interest only to the people about it, who sent their cows, geese, and donkeys to graze there; and in recent years the exercise of this privilege has been gradually falling into disuse, simply because there is scarcely any one who cares to take advantage of it. On the other hand, the Lord of the Manor did not trouble his head about land which he did not see his way to turn to account, and was quite content to leave the commons open to anybody who chose to go upon them. The rapid growth of population, however, and especially the introduction of railways, have given a sudden value to these tracts of ground in the neighbourhood of large towns. The Lords of Manors are tempted by the high prices which are offered for "eligible building sites," and as the commoners are no longer represented by cattle, it is perhaps rather hastily assumed that they have ceased to exist. Another set of people now start up under the name of the public, but the Lords refuse to recognize their claim to have anything to do with the commons. It must be admitted that the rights of the public, as a public, have never assumed a legal form. It may be very necessary that all large towns should have open spaces close to them for the recreation of the inhabitants, but it is obvious that they cannot be allowed to take possession of any bits of ground that suit their purpose without reference to proprietary rights. On the other hand, it may be asked, whether the public ought not, under certain circum-

stances, to be recognized as having succeeded to the rights which the commoners have practically abandoned. Hardly anybody wants to turn out a sheep or a cow on the commons, but a great many people want to walk on them and enjoy them as open spaces; and whether the common is used by cattle or by people walking about cannot make any difference to the Lord of the Manor, as long as he is bound to keep it open. Mr. Lefevre proposes that all enclosures not authorized by Parliament should be *prima facie* illegal, and that any public body or public-spirited person should be allowed to represent the right of the commoners and to put the Lord to a strict proof of his claims. There may probably be some difficulty in regard to the latter part of this suggestion, but it is at least clear that some check ought to be put on such proceedings as the appropriations at Epping. It is monstrous that persons who have no sort of legal right to a particular property should be able to take possession of it offhand, and to maintain the misappropriation by the aid of a long purse and sharp lawyers. A Lord who wishes to enclose can hardly complain if he is required to give due notice of his intention to do so, and to justify his alleged right before he takes advantage of it.

PARTIES AND PARTY NAMES IN THE UNITED STATES.

THE extraordinary success which has just been gained by the Democrats in every part of the American Union, rendering it probable that at the next Presidential election they will be able to wrest from the Republicans the power now wielded by the latter for fourteen consecutive years, makes it of interest to inquire, What are the distinguishing principles of the two parties? The Democrats have been so hopelessly weak since the close of the Civil War that they have had no opportunity of showing what they would be likely to do, supposing them once more called to the administration of the country; and the "platforms" adopted by them in different States at the recent elections are so discordant that we get little information from a study of those documents. Thus in New York the principles of the Democrats have been summed up by their leading organ as "hard money, Free-trade, and Home Rule." In direct contradiction to this, the Democratic programme in Ohio and Indiana was inflation of the paper currency and payment of the National Debt in greenbacks; while in the South universally the demand was for non-intervention of the Federal authorities and a white man's government. If we turn from the platforms which have just carried everything before them to the names of the parties themselves, we obtain just as little enlightenment. It is true indeed that there is a very well-marked distinction between the terms Democratic and Republican. A man may be a thoroughpaced Democrat, and yet be a Monarchist, as we see in France at this very moment, where an audacious party is advocating the restoration of a "Democratic Empire." On the other hand, a man may be a Republican without being a Democrat, as again we see in France in the persons of many of the Conservative Republicans, or as was still better exemplified in Venice, in the Seven United Provinces, and in Switzerland. But these are not the distinctions that prevail between the Democratic and Republican parties in the United States. To understand the principles underlying their antagonism, it will be necessary to travel back to the years immediately following the Declaration of Independence.

When the War of Independence first broke out, the colonists, as is well known, did not contemplate separation from the mother country. They were Englishmen, settled in America, it is true, but not the less therefore entitled to all the rights and privileges of Englishmen, amongst them to the right of exemption from taxation when not accompanied by representation. Accordingly, the opponents of Lord North's measures called themselves Whigs, to indicate that they were members of the great party which had dethroned the House of Stuart and established English liberty. In like manner, the Loyalists, as supporters of the royal prerogative and the paramount authority of Parliament, were styled Tories. The term Tory continued to be employed to the end, but as the original object of the war was lost sight of, and the minds of the Americans came to be fixed upon independence, the name of Whig grew gradually out of use. But it is a curious instance of the force of old associations and of the influence which the habits of thought of colonial days continued to exercise, that, as we shall presently see, the name was revived more than half a century later. In the meantime the progress of the war made it quite plain that, if the league of the thirteen colonies, now become States, was to be perpetuated, a closer union was indispensable. By the Articles of Confederation, which formed the first Constitution of the United States, all effective sovereignty resided in the several States. Congress was simply an Assembly of delegates, competent to raise an army and navy and to negotiate with foreign nations, but with no real power to enforce its resolutions. It could not even levy taxes, except through the States, which practically contributed only as much as they chose. The several departments of the Government, until near the very close of the war, were presided over by Committees of Congress, not by Ministers, and there was no President. The Whig party, which had formed one body to resist England, became divided into two on the question whether the Articles of Confederation should be annulled or not. The Federalists advocated a closer union; the anti-Federalists were for maintaining things as they were. It has often been pointed out that these names ought to have been reversed. The Federalists, or at

least their most distinguished leaders, wished to form a Unitarian Republic; the anti-Federalists were struggling to preserve the Federation and the full rights of the several States. However, the Federalists succeeded in imposing these names on the two sections, and after a struggle of some years they proved successful also in their political agitation. A new Constitution was adopted, which divided the powers of government between a President elected for only four years, but clothed during his term of office with virtually regal powers, a Congress of two Chambers with greatly extended legislative competency, and a judiciary invested with extraordinary authority, and ramifying even through the States. The anti-Federalist party was broken up, and during the two administrations of Washington the Federalists governed the country. But, when once the object of drawing closer the union between the States had been attained, there was no real cohesion in the party. The experience of the war had convinced all thoughtful men of the necessity of an amendment of the Articles of Confederation. Hence Mr. Madison was as active as General Hamilton in advocating such amendment, and even Mr. Jefferson gave his approval. But Jefferson and Madison wished to invest the Federal Government only with such powers as were essential for the due protection of the Union against foreign aggression and for the perpetuation of the league between the States. They desired to limit both President and Congress to the authority delegated to them by the Constitution in express words, and to forbid absolutely all constructive powers. Mr. Hamilton, on the contrary, and the elder Adams, would have the Federal Government regarded as a real national Government, competent to employ the power of the whole Union for the development of its material resources. Mr. Jefferson retired from Washington's Cabinet, and under his leadership there grew up a new party, which was composed not only of the old anti-Federalists, but also of such of the Federalists as wished to confine within the narrowest limits the activity of the Federal Government. This party styled itself Republican, implying thereby that the Federalists were aristocrats at heart. Herein was another point of difference between the parties. Jefferson and his party heartily embraced the principles of the French Revolution, and proceeded to reduce to practice with as little delay as might be the doctrines of "Liberty, Equality, and Fraternity." Hamilton, on the other hand, was an ardent admirer of the English Constitution. An anecdote recorded by Jefferson will convey to the reader a better idea of the political opinions of the Federalist leader than any description. While Jefferson, Hamilton, and the elder Adams were members of Washington's Cabinet, they met at Jefferson's house to consult on an important matter of foreign policy. After the business had been transacted, and in the course of a general conversation, Adams remarked that, if its corruptions were removed, the British Constitution would be perfect. "Remove its corruptions," replied Hamilton, "and it would be impracticable. With all its supposed defects, it is the most perfect Constitution the world has ever seen." Thus it will be seen that Hamilton was a disciple of Burke, and desired to give the United States a strong central government, and freedom tempered by authority, after the English pattern. Jefferson, on the other hand, held the views, while reproaching the atrocities, of the extreme French revolutionists, and he considered the maintenance of States' Rights and the restriction of Federal authority essential to the preservation of American liberty.

Mr. Jefferson became third President of the United States, and his party, with but three breaks of no great length, governed the country for the following sixty years. The Federalist party lost ground year after year, and became finally discredited when it fell under the suspicion of sympathy with Great Britain in the war of 1812. It struggled on for some time longer, but ultimately broke up about 1820, only to reappear, however, under the name of National Republican—a name skillfully chosen to express disavowal of sympathy with aristocracy in any form, and at the same time to proclaim that it regarded the Union as "a nation," not a mere congeries of States. But the National Republicans suffered the same fate as the Federalists, falling into utter disorganization in the course of a few years. They formed themselves again in 1832, however, to oppose the second election of General Jackson to the Presidency, adopting the old historic name of Whig. The Whigs twice elected Presidents—General Harrison in 1840, and General Taylor in 1848—but they also broke up in 1852, when the old Federalist party in its various modifications may be said to have finally died out. In the meantime the Jeffersonian party had introduced manhood suffrage, had extended citizenship to foreigners on the easiest terms, and had made nearly all offices, even the State judgeships, elective. Partly on this account, and partly to distinguish itself from the National Republican party, its members dropped the name Republican, by which it was known in Jefferson's time, and adopted that of Democratic, just as among ourselves the Whig party has been merged in the Liberals. But while the Democrats were thus actively carrying into practice their ideas of popular sovereignty, they were becoming more and more committed to the maintenance of slavery. For reasons which it would take us too long to enter into here, the main strength of the Democratic party had always been in the South, whereas New England was the principal support of Federalists and Whigs. Even in this matter, it will be seen, the antagonism between North and South thus early showed itself. But this circumstance made it almost impossible for the Democrats as a party to declare against slavery. Further, the existence of slavery gave the slave-owners more leisure for

study and attention to politics, and consequently the leaders of the Democratic party have been almost always Southerners. Lastly, the cardinal Democratic doctrine—the doctrine of States' Rights—bound the party to uphold the right of the separate States to exclusive jurisdiction over the question of slavery, and consequently to resist as an encroachment and an impertinence all attempts on the part of the inhabitants of other States to intervene in a matter of strictly internal policy. In this way the party which was most deeply pledged to respect “the inalienable right of all men to life, liberty, and the pursuit of happiness,” became irrevocably committed to the refusal of every human right to millions of men, women, and children. Had the South been contented with the maintenance of slavery, it would unquestionably have succeeded, as nobody but a mere handful of uninfluential and unpopular Abolitionists denied the exclusive jurisdiction of the States over the question. But the South was not so satisfied. It endeavoured to extend slavery by conquests in Mexico and the West Indies, and by carrying it into the Territories. The Territories, it is hardly necessary to explain, are those portions of the public domain of the United States which have been formed by Act of Congress into distinct legal communities, with Governors, Legislatures, and courts of law. But, unlike the States, they are not sovereign commonwealths. Their legal and administrative officers are appointed by the President, and their Legislature may be overridden at any moment by Congress. Now, the Southerners contended, and, except by appeal to Mr. Seward's “higher law,” it is impossible to rebut the contention, that they had a right to settle in any part of the public domain they chose, and to take their property with them. In other words, they maintained that it was the duty of Congress to recognize slavery in the Territories by protecting the property of such slave-owners as should settle in them in the slaves they carried with them. To oppose the claim thus put forward the Republican party came into existence just twenty years ago. It was formed in the first place of the remnant of the Whigs, to which body belonged the late Mr. Greeley, President Lincoln, and Secretary Seward; and of Free-Soil Democrats, men who had acted with the Democrats, but revolted against the extension of slavery. In the course of the two following years the new party was joined by the majority of the “American,” or Know-Nothing, party—a party whose bond of union was hostility to foreigners and Roman Catholics. The Abolitionists were for a long time allies rather than members of the Republican party, though they also ultimately joined it. And, lastly, when secession took place, the party was largely reinforced by “War Democrats,” men who would have suffered the extension of slavery to the Territories, but would not allow the break-up of the Union. Thus it will be seen that the Republican party was rather a coalition of fractions of parties opposed to certain specific Democratic measures than a party in the strict sense of the word, with definite political principles of its own. At the same time, however, it had one principle—opposition to the extension of slavery—for which was afterwards substituted the resolve to maintain the Union, and it inherited from the Whigs the desire to stretch the Constitution so as to increase the authority of the Federal Government, and to develop the resources of the country by means of Protection and internal improvements. It was not, however, Abolitionist until the ill success of the military operations undertaken against the South prompted the Proclamation of Emancipation as a war measure.

CEMETERIES AT HOME AND ABROAD.

CHURCHYARDS and funerals are gloomy things at best, and they generally wear their most offensive aspects for those who live in the crowded centres of civilization. Deaths are frequent and land is scarce; and when the bulk of the population is poor, and the obligation of providing mortuary accommodation falls upon the rates, the feelings of the living must often be sacrificed to their interests. There have just been some unpleasant revelations with regard to the suburban graveyards of Battersea and Tooting, and those who are implicated have admitted themselves to blame, pleading their straitened means in extenuation. We have no intention of dwelling on disagreeable details. The long and the short of it is that houses have been springing up and population increasing around the fixed areas of these suburban cemeteries. The soil is drained to an average depth of eight feet, but the graves have generally been sunk to a much greater depth. Notwithstanding, space has often been economized by laying coffin upon coffin without interposing the foot of hard-rammed soil enjoined by the statute. Below the drains there is frequently a bed of holding clay. The consequence is that the rain stagnates instead of sinking away; noxious gases are disengaged without being deodorized; the mourners suffer with the officiating clergymen at the frequent funerals, while inhabitants in the immediate neighbourhood must be constantly inhaling vitiated air. Of course it is always rash to jump to general conclusions from particular instances, yet we may be sure we are pretty safe in assuming that Tooting and Battersea are not very exceptional cases. Both neighbourhoods are tolerably well-to-do, and by no means especially crowded. And it must be owned that cases of this kind furnish plausible arguments to those who advocate cremation for old and overcrowded communities. For ourselves, we do not care to pronounce an opinion in the matter; but it is certainly undesirable that preventable abuses should strengthen the hands of those who advocate a questionable innovation.

In interments, as in everything else which is a question of money, the rich must always have the best of it. They can afford to pay for the luxuries of sentiment, as they can command the leisure for indulging their grief. Of late our English *pompes funèbres* have offered them great advantages. Formerly wealthy families had their private vaults, either in the church in which they worshipped or in the yard that surrounded it. Visiting the tombs of the dead they had buried out of their sight, they could enjoy little of that peaceful seclusion which the bereaved mourner covets above everything. Sanitary considerations apart, nothing could have been more trying than having to ask the beadle for the keys of a church every time they came to pay a visit, or having to make their way to the grave in the populous churchyard, with crowds staring in through the railings from the thoroughfares. Now that great country cemeteries have been brought into fashion, natural feeling would have triumphed over family pride even without the interposition of the Legislature. The Cemetery Companies assured themselves the best chance of a financial success by offering mourners unrestrained liberty of indulging their sorrow. Londoners have been particularly fortunate in this respect. As it happens, the home counties are singularly rich in the possession of invaluable barren ground which will never repay reclaiming. On heaths like Woking, beyond the ordinary range of residence of business men, picturesque sites are to be had for a comparative trifle. Lying high and bare of timber, the fresh breezes circulate freely, giving an invigorating sense of health and life by way of antidote to dismal associations. The soil is a clean gravel, and very much drains itself. Yet there is peat in the neighbourhood to be had for the fetching, so that rhododendrons, azaleas, and flowering shrubs flourish amazingly. Shooting up to town from Southampton, through somewhat bleak scenery, that blooming oasis in the wastes has a singular attraction for those who would cherish the poetry of death. It enjoys as much sun and light as we ever have in England; there never need be crowding, and for all practical purposes there is always solitude enough. It is true that the family burying-ground may be far from the family residence. But railways nowadays annihilate space and time, and for those who make a religion of the memory of the departed, the very necessity which requires a kind of pilgrimage gives a certain impressive solemnity to periodical excursions to the tomb. In laying out these country cemeteries every town of any importance has followed the example of London, and in nothing perhaps has joint-stock enterprise done more for us. Had parishes and districts continued in all cases to provide graves for their ratepayers, they might possibly have paid some attention to sanitary considerations; but certainly they would have subordinated everything to economy. The most convenient piece of eligible land that the building speculators had neglected would have answered their purposes. As it is, the first idea of the promoters of a Cemetery Company is to invoke the aid of nature to advertise them. They lay themselves out to secure the most picturesque sites, and call the most eminent landscape gardeners into consultation. We say nothing of the ornaments in the way of statuary and sculpture, for these must necessarily be left to individual fancy, although even there we think we have improved upon the weeping angels bending over mus draped in palls. But now we can show provincial cemeteries that scarcely yield to any others in the world. Some of our readers may remember the romantic beauty of the necropolis at prosaic Greenock, with its broken hills embosomed in trees and blooming shrubs, commanding magnificent views of the Western Highlands beyond the widening expanse of the Firth of Clyde.

Foreigners had long anticipated us in this matter, although now we think we may flatter ourselves that we have passed them. Thanks very much to the tenets and practices of their religions, they have always had a regard for the poetry of the tomb. Roman Catholics keep the annual festival of All Souls in the cemeteries. Believing that the spirits of the departed are still within the reach of their prayers, they naturally seek to aid their devotions by kneeling over the graves. They pay their regular tributes to the memories they cherish with flowers and wreaths of *immortelles*, and these practices have their uses as well as their beauties. They secure the graves against neglect, and give them a general aspect of melancholy coquetry. At best, however, the coquetry is very much on the surface, and the disagreeables of the charnel-house will show through the garish coating of thin whitewash. Take Paris. Every visitor to it is familiar with Père la Chaise, and many people must have admired the cypress-covered slopes of Montmartre. But you cannot have visited them of an afternoon, and especially on a Sunday, without remarking how unceasingly the funerals pour into them. Spacious as they are, Paris has been extending itself out of all proportion to them. Let families increase and multiply and die as fast as they will, there is no room to strike out additions to those cramped little Grecian temples, the receptacles of their mortal remains. Those “concessions à perpétuité” engraved on their façades mean a great deal. For on the spaces devoted to the poor on the north and the east, the ground is perpetually being disturbed, and the dust shaken up in quicklime is always being stirred. It is not without reason that the question of rural burial-fields is exciting great attention among our neighbours, and we have only to read the articles in the Paris journals on the subject to be assured that the scenes which may be daily witnessed in early morning in those beautifully kept pleasure-grounds are utterly shocking to our sense of decency.

The “God's acres” in Germany are regarded with all the reverence which the name implies, yet for the most part they are quite as

much encumbered as burial-grounds elsewhere; and you may see the signs of it if you get a glimpse into the little dead-house in some obscure corner. Even where latterly they have extended their limits, as the cities to which they belong have burst out of the old fortifications, there too the sharp line is drawn between the rich and the poor, or even the moderately well-to-do. For example, there is the famous burying-ground at Nuremberg, devoted to its purpose, we fancy, by that famous Free City of the Empire, almost from time immemorial. At one end you see flowers and trees and broad walks in front of the chapels where the dead are laid out until the seal of death shall have become unmistakable. At the other is German organization carried out to the utmost; tombstones marshalled by line and rule in serried files, and regularly numbered up to thousands. In Switzerland, as might be expected, you come upon some of the most picturesque sites in the world for churches and burial-places. One remembers particularly the square churchyard at Thun, rich with creepers and flowers, and commanding from the seats under the stone summer houses at its angles the most magnificently panoramic views over the blue lake and the snowy mountains. Yet at Thun, beautiful as it is, there is less lying-room than in most other places. The ground sinks precipitously all around, and wherever there is not an almost perpendicular precipice, the graves come clambering up to the enclosures. In some Southern countries, where the lifeless clay is surrounded with ceremonies before interment, the people are often singularly heedless of what becomes of it when committed to the soil. There are tolerably thriving old cathedral towns where children and young girls are always being theatrically exhibited in *chappelles ardentes*, or paraded in procession along the streets in wreaths and gloves and ghastly draperies. You see funeral after funeral go by, when after a time it strikes you of a sudden that somehow you have never stumbled on the burial-ground. If you go in search of it, you find it in some remote nook, and are puzzled to conceive how it can possibly suffice for the population. The mystery may in a measure be solved if you have chanced to attend the afternoon interments at the old Campo Santo at Naples. There you will find three hundred and sixty-five pits; a pit is opened on each day of the year; the priest on duty performs the rites *en masse* over all the deceased of the day before; the contents of the surrounding biers are shot out down the office; there is a sprinkling of holy water and a shower of quicklime; the circular slab is replaced, and all is over. The Mussulman cemeteries in the East are as gloomy as may be. Every one must remember those great forests of cypress, casting their black shadows on the rough-hewn stones below, with the sculptured turbans and other emblems of the faithful; but with these cemeteries the infidels who may die in these parts have no concern. Not that the Christians, at least at Constantinople, need regret it, for their own resting-places are the most beautiful in the world. There is Scutari, on the crest of the heights, the pure white marble of its graceful monuments rising out of an Eastern garden against the cloudless blue of an Eastern sky. Even more attractive are some of those wild outlying enclosures, dating from the war-time, on which you light in the neighbourhood of Buyukdere or Therapia. Often, indeed, they are almost lost to sight in the rank undergrowth of tangled vegetation, till you can scarcely force your way to an examination of the epitaphs; but then they are sacred from intrusion or desecration. Yet, lovely as they are, the relatives of their tenants might think the romance of those half-forgotten resting-places but an indifferent compensation for their hopeless remoteness, and, remembering that England is the country of the rich, we may on the whole congratulate ourselves on surpassing the world in what may be called cemetery-gardening.

THE "RENTERS" OF DRURY LANE THEATRE.

THE history of Drury Lane Theatre has been told this week in the Court of Common Pleas. That history has been often told before both in prose and verse. Many poets compared the theatre when it was rebuilt, after burning, to a phoenix; and one of them supposed that this phoenix had been shot for the "pot" by Arabs, who resolved first to roast and then boil it:—

So Drury, first in roasting flames consumed,
Then by old renters to hot water doom'd,

rose out of conflagration and litigation,

By Wyatt's trowel patted, plump and sleek.

An Act of Parliament of 1810 recites that the existence of well-regulated theatres, substantially built, and capable of affording the best accommodation, has always been considered to be a matter worthy both of royal attention and legislative protection. The Act further recites that the Theatre Royal in Drury Lane had been rebuilt in 1794, and that "great sums" had been expended on it, and heavy claims incurred. "And whereas in the course of a successful progress towards the liquidation of the said claims the said Theatre Royal, with all its scenery, wardrobes, furniture, and other articles was wholly destroyed by the calamity of fire in the year 1809," the Act proceeded to incorporate a Company of Proprietors for rebuilding the same. The Company thus formed was managed by a Committee who understood business better than literature. When the theatre was finished, they incurred general ridicule by advertising for an opening address to be sealed and delivered like a tender for a con-

tract. We have all heard of tradesman who kept a poet, and there is a story of a British tourist who introduced himself to Canova, saying that he understood that like himself he was in the stone and marble line. These stories go some way to justify the reproach that we are a nation of shopkeepers, and certainly this step of the Committee of Drury Lane Theatre was a thoroughly huckstering proceeding. The addresses sent in answer to their advertisement were so execrable that the critics of the day wondered that the Committee did not choose one of them. The debates in the Committee-room were compared to the confusion of tongues at the Tower of Babel, and when they determined to reject all the tenders and apply to Lord Byron to write an address, they were likened to a firm which should advertise a lottery, and, after selling all the tickets, announce that there would be no drawing, as they intended to transfer the 20,000*l.* prize to a friend of their own.

But although this Committee deserved all the hard things that were said of them, they earned the gratitude of posterity by giving occasion for the composition of *Rejected Addresses*, which will be read as long as the poets whom it parodies. Scott did no more than justice to the description of the death of Higginbottom the fireman, when he said that he certainly must have written it himself, although he forgot on what occasion. Almost better than the "Addresses" themselves was the criticism upon them of a Leicestershire clergyman who did not see why they should have been rejected, as he thought some of them very good. The "Address" which introduced that "feathered incombustible," the phoenix, is still quoted for its happy ridicule of the extravagant anti-Bonapartism of the period. Wellington at Salamanca

Breaks through his lines, and leaves his boasted Marmont
Expiring on the plain without his arm on.

For twenty years after the *Rejected Addresses* appeared everybody knew them and understood allusions to them. Thus Mr. Greville in his Memoirs records a joke of Luttrell. Somebody quoted the first line of the parody of Coleridge, and Luttrell said the public was pensive and the King (George IV.) expensive. The lines will bear quoting now when they are less generally known:—

My pen-ive Public, wherefore look you sad?
I had a grandmother, she kept a donkey.

His face was sad, and you are sad, my Public.

But the public has cause for joy. The author had wept over the ruins of the theatre, and feared it would not be rebuilt, until one joyful Monday eve, walking along Charles Street, he heard a trowel tick against a brick, and saw that the work of reconstruction had begun. From that hour he watched the builders, and listened to the talk of others who also watched:—

While some believed it never would be finish'd,
Some, on the contrary, believed it would.

This is a grotesque poem, but not perhaps much of a parody of Coleridge. The gems of the collection are the imitations of Scott and Crabbe; an extract from the latter might have been read to the Court of Common Pleas by way of "inducement," as lawyers say, to the plaintiff's declaration for assault and battery:—

Now the full benches to late-comers doom
No room for standing, miscell'd "standing room."
Hark! the check-taken moody silence breaks,
And bawling "Pit full!" gives the check he takes;
Yet onward still the gathering numbers cram,
Contenting crowders about the frequent damn,
And all is bustle, squeeze, row, jabbering, and jam.

The parody of Southey is scarcely intelligible without notes. But perhaps we might have guessed that Veeshnoo was Mr. Whitbread, who had all the talents of a manager, and also that common weakness of fancying he could write himself. One of the "Addresses" actually rejected by the Committee of which Mr. Whitbread was a member is said to have been written by him. Sheridan declared that he had introduced a phoenix into his poem, and described it like a poulterer. He was one more instance of the desire of men to be that for which nature has not fitted them. But he also was the energetic man of business:—

He treats with men of all conditions,
Poets and players, tradesmen and musicians;
Nay, even ventures
To attack the renters,
Old and new;

just like a manager of the present time. We believe that both history and poetry agree in ascribing to Mr. Whitbread, or Veeshnoo, the merit of bringing about the compromise of the renters' rights on which the plaintiff's claim in the recent action was founded:—

Veeshnoo, now thy work proceeds;
The solicitor reads,
And, merit of merit!
Red wax and green ferret
Are fixed at the foot of the deeds.

It is not surprising that the popularity of these *Rejected Addresses* rather threw into the shade the Address which was actually delivered. Yet Byron's vigorous lines are still, after more than sixty years, only too applicable to the management of this theatre:—

If e'er frivolity has led to fame,
And made us blush that you forbear to blame;
Nay, lower still, the Drama yet deplores
That late she deigned to crawl upon all-fours.
When Richard roars in Bosworth for a horse,
If you command, the steed must come in course;
If you decree, the stage must condescend
To soothe the sickly taste we dare not mend.

The Committee, under the guidance of Mr. Whitbread, cut out some of these lines, much to the disgust of Byron, who implored "one lash at those accursed quadrupeds." A manager who has produced *Formosa* and got up a tournament in *Richard Cœur de Lion* may console himself under the censure of these bitter lines by observing that they applied almost equally to his predecessors, the contemporaries of Garrick and the Kembles. There was, however, this difference, that sixty years ago the "accursed quadrupeds" did not keep possession of the stage for many successive months. Indeed the "renter" who has lately come before the Court is a creature of a bygone age. When he stipulated for a free admission every night, he contemplated the acquisition of a valuable privilege. But any man who could willingly see *Richard Cœur de Lion* half a dozen times must have come out of a lunatic asylum or be on his way to one. When the "renters" acquired their rights the bill was changed every night, and many of these renters went as frequently to the theatre as subscribers now go to the opera. But we have changed all that, and the change is distinctly for the worse.

The question before the Court of Common Pleas was tolerably simple, and probably only a lawyer could have invented the defence which was set up to the plaintiff's claim. Under the arrangement made in 1810 each "new renter" is entitled to 1s. 3d. for each night of performance, and to free admission to the usual audience part of the house. When the theatre was opened in 1812 it contained fourteen private boxes, and all the rest of the house was confessedly accessible to the "new renters." The pit in those days extended to the orchestra, and it was not till thirty years afterwards that pit-stalls were introduced. The present manager claimed in substance to exclude the "new renters" from the pit-stalls, except on payment of the difference between the price of a dress-circle ticket, which is 5s., and that of a stall ticket, which is 7s. His notion was that a "new renter's" right was represented by 5s., but this seems to be a merely arbitrary assumption. Mr. Dauncey, the plaintiff in the case, claimed and received a ticket for the dress-circle, and, not finding a convenient place there, he then claimed to pass into the stalls. He received a ticket marked "dress-circle cross," and on presenting this at the entrance to the stalls two shillings was demanded of him, which he refused to pay. Being refused admittance, he proceeded to assert his right, and was then expelled by the defendant's servant, who, in the language of pleading, *molliter manus inposuit* for that purpose. There does not appear to have been more violence used on either side than was necessary to raise the question of right; and, looking to the character of the defence set up, we feel bound to say that the plaintiff deserves the thanks of his fellow "renters" for asserting his right by costly litigation. Very few of the class would be likely to show the courage and pertinacity to resist what appears to be a usurpation, and thus by lapse of time the large right which the Acts of Parliament professed to confer would become limited. The defendant contended that the plaintiff had exhausted his "renter's" right for the night by entering the dress-circle, and could only pass to the stalls like one of the public by paying the difference in price. But this is a mere unauthorized gloss on the statute, which enacts that the "new renters" shall be entitled to the "free liberty and privilege of admission into the usual audience part of the theatre before the curtain," except the private boxes. This right, however, must be exercised reasonably, and is subject to regulations properly made by the proprietors. It is conceded that the "new renter" cannot book his place beforehand except by payment, and the manager seems to be at liberty to turn the whole of the dress circle into private boxes, as is in fact done during the opera season. In this season also the whole of the pit is converted into stalls, and all these stalls might, we believe, be let beforehand. The manager has however hitherto set apart a certain number of stalls for the "new renters," and they have also access to the upper circle of boxes, which is called during the theatrical season the "first" circle. It can easily be conceived that these "new renters" are regarded by the managerial mind as a troublesome relic of antiquity. But the attempt to improve them out of the theatre by force of law does not seem hopeful. The defendant has, however, stated his intention to appeal against the adverse judgment.

REVIEWS.

SPEEDING'S BACON.—VOL. VII.*

IT is not easy to choose appropriate terms in which to congratulate Mr. Spedding on the completion of his labours. Of the length and variety of those labours few will need to be reminded; the publication of the *Life and Letters and Occasional Works* alone has now extended over thirteen years, and seventeen years have passed since Mr. Spedding and his associates put forth the first of the long series of volumes to which this standard edition and biography now extend. Yet Bacon's biographer and joint editor, if an author of many pages, is a man of few words. In this concluding volume itself, where the temptation to expand in the direction of comment might have proved irresistible even to many writers habituated to self-restraint, it would be difficult to point to

a paragraph which is, strictly speaking, superfluous, and it would certainly be impossible to find a sentence which is irrelevant. Mr. Spedding, with grave politeness, leaves to "the debating societies" the settlement of the question whether "the character of Bacon was deserving of the approbation of posterity." For himself, he is contented to achieve his endeavour of enabling posterity "to form a true conception of the kind of man Bacon was," and of effecting this by following him step by step through the "unusually full record of a more than unusually full life." The result is a biographical monument to which it would not be easy to find a parallel in English literature, least of all in that of our own generation. The works of Bacon, together with the Commentary, may now at last be deposited, as he wished his *De Augmentis* to be, in the great College by honouring whose most illustrious member three of her sons have likewise honoured her and themselves; and there, and wherever wisdom and patriotism are cherished, this endeavour to preserve the memory of their great exemplar may be left to produce its fruit—"tanquam in solo nativo."

On the present occasion our remarks must be confined to a few of the topics suggested by the volume before us. It begins with the close of the year 1618 (O.S.), so that it includes the last seven years of Bacon's life. In other words, we have here a view of two of the most active and important years of Bacon's official career, of its sharp and sudden termination, and of something less than five years of bitter adversity, tempered by little besides sustained intellectual effort and such hope as a self-consciousness rising above outward circumstances can give. We accompany Bacon from the days when the Favourite was importuning him with letters on behalf of his friends, and when the King was sending him, on the occasion of their simultaneous sickness, "great pledges and certainties of his love and favour," to those other days when, shut out from London, the fallen statesman was exclaiming in a rare moment of bitter irony that he was "no Jesuit nor no leper," and when, thinking his hour was near, he bequeathed his name and memory "to men's charitable speeches, and to foreign nations, and the next ages." Between these times lies the catastrophe itself. With reference to this, the chief value of Mr. Spedding's narrative is to be found in the fact that it fairly forces the reader to dismiss from his mind all hypotheses which have an imaginary Bacon for their basis. Even so, and notwithstanding the biographer's scrupulous care in distinguishing probable conjectures from established facts, and ethical theories from principles of law, it is not easy to guard against mistaking their relative weight in determining a final conclusion. Thus, in arguing (we think, very justly) that, astonishing as the supposition may seem, the charge against Bacon came upon him as a surprise, Mr. Spedding is most careful to explain the nature of the data on which he has arrived at this result; but the reader, though he may have no excuse for misapprehension, will not find himself relieved from the necessity of extreme caution. To the offer made by the Lord Chancellor as late as February 17th (Awbrey's petition was presented on March 14th) to the Committee for Courts of Justice, "that any man might speak freely anything concerning his Court," we should indeed hardly be inclined to attribute so much significance as Mr. Spedding seems to see in it. The letter to Matthew, which Mr. Spedding assigns with extreme probability to about the middle of March, may of course have been written at some earlier time; for "the Lord" mentioned in it can only conjecturally be identified with Digby; nor is there, we presume, any actual proof that Matthew was then at Brussels. But this letter and the other likewise (it cannot be doubted) addressed to Matthew, taken in conjunction with the offer made in February, and with the tone of the well-known letter to Buckingham ("Your Lordship spake of purgatory")—a tone of indignation rather than real despondency—will leave no reasonable doubt as to the correctness of Mr. Spedding's view, unless the reader has set out with the assurance that Bacon had been a conscious offender in his judicial administration. Now of course there is nothing easier than to assume this, if one wishes here as elsewhere to apply Macaulay's development of a paradoxical antithesis, or, like Kuno Fischer, to suit Bacon's conduct to a particular view of the man previously constructed out of a particular view of his works. But of evidence that Bacon had at any previous time been conscious of misconduct in his office, or that, up to almost the very last, he had anticipated any charge in this direction, there is no trace. Indeed the very statement that, in the beginning of March, Bacon had been warned of Awbrey's intention, and, though at first denying the imputation, had been so far disturbed as to take measures to cause Awbrey to retract or forbear it, appears to rest on a mere rumour, as will be manifest on referring to the authority quoted by Mr. Spedding. And the same is the case with reference to the similar story of Bacon's reception of the first tidings of the Egerton charge, a story to which we think Mr. Spedding does not refer. But, however this may be, the spirit of Mr. Spedding's view remains uncontradicted by what Bacon said or attempted to do so late as this, while there is abundant evidence to show what opinion Bacon consistently held as to the general course of his judicial administration. Even when he had come to regard his sentence as "just," and, again, as "the justest censure in Parliament that was these two hundred years," he continued to look back with conscious pride on his administration of his Chancellorship; described himself, when writing from the Tower to Buckingham, as "the justest Chancellor that hath been in the five changes since Sir Nicholas Bacon's time"; and, in a private assurance confidentially imparted to his secretary, and

* *Letters and Life of Francis Bacon.* By James Spedding. Vol. VII. London: Longmans & Co. 1874.

neither intended for publication nor indeed published by Rawley again spoke of himself as "the justest judge that was in England these fifty years." It would be a perverse view which should see in this a "St. Helena" confidence.

Into the merits of the whole case we cannot now enter. Mr. Spedding's discussion of the subject, however, makes it more manifest than ever that the real difficulty is not to be sought in the conduct of Bacon during the progress of the inquiry. This conduct was so far consistent that he never throughout the entire proceedings was false to the promise which he gave at their commencement to the Lords, that he would not "trick up an innocency with cavillations." On examining his case and preparing for an interview with the King, Bacon recognized that he had erred; but it was not till the eleventh hour that he recognized, or indeed could have recognized, to what extent he had erred. It was when the number and range of the charges first became known to him that he abandoned his position; and, instead of adhering to the hope of being able to reduce the offences of which he stood accused to cases of negligence, sought in a general submission and confession the best remaining prospect of lenient treatment. This change of attitude, so far from pointing to a consciousness of corruption, seems to us rather to support the view that negligence—culpable negligence—had been the wrong committed by Bacon, but that it was not till the charges became known to him that he recognized their overwhelming number. "The articles were," as Mr. Spedding says, "too many," though we should hesitate in subscribing to the words he adds—"and the mind of the House too manifestly made up." On the other hand, there can be no doubt that the method of verdict adopted by the House of Lords—namely, that of convicting the accused *super totam materiam*, instead of pronouncing his guilt or innocence on each of the twenty-eight charges *seriatim*—practically leaves the particular charges to be tried over again by posterity. But posterity is only very imperfectly able to do so, and must content itself with arriving at certain general conclusions which seem to amount to the establishment of much culpable negligence, yet not of that corruption which Bacon (in the note prepared by him for an interview with the King) defines as "bargain or contract for reward to pervert justice, *pendente lite*," and of which he (in the same note) declares his belief that he is "as innocent as any born upon St. Innocents' day." And here comes in the fact, urged with much force by Mr. Spedding in his summary at the end of this volume, that there are no traces to be found of an actual reversal of any of Bacon's decrees in Chancery.

We cannot follow Mr. Spedding into his argument on the question whether the taking of gifts (without corrupt intention) in itself constituted a legal offence in a Chancellor as it did in a Common Law Judge; and the evidence as to the practice of previous Chancellors confessedly reduces itself to a matter of conjecture. We should in any case be slow to agree with those who demand from a great man, even in those fields of action with which his greatness is associated, an immediate self-emancipation from evil practices or principles in vogue before him. We can believe in the elevation of Bacon's motives as a judge, though he took gifts, as we can believe in the progressive spirit of More, though he was a persecutor. But there was some force in a remark made in the course of the debate which arose in the Lords on the Chancellor's submission, that it was not becoming that he should throw the blame of his faults on the age rather than on himself. Only a moral pedant will fail to make allowance for the anguish of mind in which Bacon had written the confession at the close of which he asks their lordships not to "forget that there are *vitia temporis* as well as *vitia hominis*." But we may regret that he did not follow to the last the higher impulse which had prompted him, in the note already cited, to set down how "all this while, I do not fly to that, as to say" what he could not refrain from urging upon his judges. Such a plea ill consorts with a spirit born to advance his age, and befits a Bacon as little as that still lower plea befits common men which Cicero ironically advances when pretending by way of contrast to excuse some of the doings of Verres—"Forsitan aliquis aliquando ejusmodi quippiam fecerit." Yet what seems a poor apology in Bacon's mouth cannot be overlooked as an element in the consideration of his case by the dispassionate judgment of another age.

Though Mr. Spedding adheres to a rigid personal method which would prove an intolerable restriction to the "Life and Times" class of biographers, there is nothing of greater interest in this volume than the light thrown upon Bacon's aims and wishes in relation to the foreign policy of his country. In matters of home government not specially connected with his own office, there was more than one occasion during the last two years of his Chancellorship on which he manifested a striking political foresight. His advice to the King recommending the distribution of particular branches of Government business among standing commissions was followed in spirit, if not in detail, by later ages, and has in part survived into times to whose requirements it is not invariably so well adapted as to the conditions of Tudor and early Stuart constitutional life. His arguments, on the other hand, in favour of restoring the responsibility of the Treasury to a single officer have a wider and more enduring significance. His proposal of rules for the Star Chamber (though their spirit can be only indirectly gathered), made at a time when there was, so far as we know, no public feeling against the court, might, if realised, have remedied, as Mr. Spedding sagaciously suggests, the very defect which ultimately brought

the court to its fall. But of the general system of domestic government pursued in these years Bacon was after all a supple and intelligent agent and no more—willing to accommodate himself to courses over which he had no control, and upon which he never exercised a more than secondary influence. In proposing the commissions aforesaid, he begs the King not to be deterred by the fear that some will conceive such a step to be merely a preparation for a Parliament. Yet he only ventures to hint that such an impression would do no harm; he does not indicate any opinion on the subject of the summoning of a Parliament itself. When in 1620 this step had been determined upon, he dutifully set to work to expedite the preparations for it; but his draft of a Proclamation was treated by the superior powers after a very unceremonious fashion, and the Chancellor was swift to "approve his Majesty's judgment and foresight above his own." On the question (purely one of policy) as to the advisableness of revoking the most obnoxious patents *before* the assembling of Parliament, Bacon, who strongly urged this course of action, had to acquiesce in the contrary decision—a very unfortunate one, as it happened, for himself. In a word, the respect paid to his counsels fell far short both of their value and of his readiness in offering them, and his anxiety to advance the interests of the King, his Minister, and his subjects ("for I do not love the word People"), was much greater than his power to influence the policy of the Crown.

This was, of course, most emphatically the case in the domain of foreign affairs; but here, where Bacon's advice was least continuously able to exert any influence, his political views were perhaps most definite and most in accordance with the prevailing national sentiment. It does one's heart good to see how thoroughly, on the all-important topic of the relations between England and Spain, the wishes of so discreet and cautious a counsellor were in accordance with the healthiest current of public opinion (in which we do not for a moment deny that there was a great admixture of prejudice); and after following Mr. Spedding's record up to the very period preceding the declaration of war, one seems more fully to appreciate the feeling which moved Bacon, in the brief will drawn up by him at the most critical moment of his career, to express a particular wish for the publication of his eulogium *In felicem memoriam Regine Elizabethæ*. To James and his Government he might display the "morigeration" of a loyal servant, but his heart was with the old days. In the letters and tractates of this the greatest man of the age we meet with the same feeling—often of course guardedly expressed, but equally consistent and intense—as that which pervades the despised "popular" literature of the times. He firmly believed in the dangers to be apprehended from Spain; he longed for war with that Power; and the spirit in which he viewed the prospect of its immediate declaration may be gathered with sufficient clearness from the *Considerations* drawn up by him in 1624—one of the most patriotic and stirring papers in the whole range of our political literature.

Neither Bacon nor the "orators and pamphleteers" to whom Mr. Spedding refers in a superior way which he occasionally permits himself could of course penetrate the secrets of the Royal policy. Yet Bacon's instinct at least was often truer than the fulness of the King's knowledge. Early in 1619, to which period Mr. Spedding assigns the *Short View of Great Britain and Spain* attributed to Bacon, the author of this paper was already recommending war with Spain as both just and likely to prove successful. The King had, however, entered upon his attempts at mediation, begun by him as the dupe of Spain, which had already elsewhere expressed its readiness to support the House of Austria with money, and if necessary with men. Of the nature of Bacon's advice both immediately before and after the acceptance of the Bohemian Crown by the Elector Palatine, though we know it to have been sought at both times, it is peculiarly unfortunate that no evidence should remain. In the second stage of the history of the question, which may be dated from 1620, when it had become clear that the Palatinate was in danger, it is equally certain that James was once more the dupe of the Spaniards, and that Bacon was intent upon a vigorous course of action which the King was as yet unwilling to adopt. The Chancellor was most willing to promote the King's wish for the suppression of the "licentious course of talking and writing" among the public at large; but he advocated a clear exposition of the existing situation in the Proclamation to the Parliament now contemplated, including a declaration that "a concurrence of reasons and respects of religion, nature, honour, and estate," had determined the King to recover the Palatinate to "his son and his descendants." But this seemed to the King to be moving too fast. Two subscriptions were opened for the war in the Palatinate (Mr. Spedding's remarks on the latter of these seem to us open to criticism, especially as he has not, so far as we observe, mentioned the former, to which there was more reason to demur); but James was still indulging the hope of inducing Frederick to resign the Bohemian Crown, and thereby causing Spain to co-operate in the restoration of the Palatinate to its rightful owner. But there were those who, without the King's opportunities, saw more clearly into the policy of Spain than he; and if a paper (*For the freeing of the Palatinate, &c.*), probably belonging to the period, was, as seems very likely, written by Bacon, he perceived what had been the result of the King's trust in the upright intentions of the Spaniards. "The confidence," it is observed in this paper, "they (i.e. the Spaniards) had in his Majesty that he would not break with Spain, was the encouragement without which I think Spinola would never have set upon the Palatinate."

Of the proceedings in the Parliament of 1621 with regard to the Palatinate Mr. Spedding takes a view on which we should feel disposed to make some strictures were it not that Bacon no longer played any part in public life in connexion with these transactions. When Parliament separated with an enthusiastic general declaration of readiness to support the King in his determination to recover the Palatinate, Bacon was a fallen man, and could only signify in a brief letter to Buckingham his joy in this "day of very great honour to his Majesty." In his exile—for such it was to him—he continued to take a lively interest in the course of foreign policy, and to entertain the same views as to the direction which it should take. Oddly enough, he was the means (by information which he loyally forwarded to Buckingham) of stopping "a Papal aggression" in the shape of the appointment of one or more titular Catholic bishops in England; for Gondomar, who at that time was really in earnest about the Spanish match, and had some reason to believe that he really held the alliance of England in his hands, very speedily arrested the unseasonable project. When, on the return of Prince Charles and Buckingham from their famous visit to Madrid, the days of a decisive anti-Spanish policy seemed at last to have set in, Bacon, with unwonted eagerness, displayed his wish to be once more of active service. He offered most sagacious advice to Buckingham, to whom the public interest moved him to speak with remarkable frankness, and even volunteered to pay a visit to France, in order to help in the tying of a "strait league" with that country. He prepared notes for a speech concerning a war with Spain, to be delivered by a member of the House of Commons; and, finally, he composed a treatise addressed to the Prince, already referred to above. In once more directing the reader's attention to this masterly essay, we may point out that it contains, in addition to an historical summary of English struggles with Spain, which must still stir the heart of every Englishman, an argument on the justice and expediency of *preventive* wars specially worthy of the attention of some Englishmen of a later generation—"otherwise reverend men, yet fitter to guide penknives than swords." These *Considerations* are not the least noble of Bacon's legacies to his nation; and the spirit which they attest should not be forgotten among the causes which ought to make Englishmen at least careful of his fame.

THE VALLEYS OF TIROL.*

WE must say a word or two upon the title of this book. The Tirolese themselves, as Miss Busk remarks, always spell the name of their country Tirol, and there seems to be no good reason for the ordinary English change into Tyrol. We agree with her again that there is as little reason for prefixing the definite article. We might just as well say "the France" as "the Tyrol." So far we find ourselves in perfect agreement with Miss Busk, nor have we any great fault to find with the substance of her book. Such criticism as we have to make may as well be got over at once. In her title-page Miss Busk professes to describe the traditions and customs of the Tirolese valleys, and to tell us how to visit them. We cannot say that a lady who is prevented from crossing a good carriage pass by the enormous quantity of luggage belonging to her party is quite competent as a guide to a mountain country. She is unable to penetrate into the more primitive parts, though she contrives to see some of the most characteristic districts. In another respect the book is a little too ambitious. Miss Busk's primary object appears to have been to collect the popular legends of the country, as a contribution to the study of what is called folk-lore. This very praiseworthy design is, however, complicated by the intrusion of a great deal of purely guide-book information. We can read in Murray or in Ball the list of the statues on the Maximilian monument at Innsbruck; and we do not particularly care to have them over again in a book which does not aim at being a comprehensive guide. And, finally, we may say that we object to the style in which some of the legends are narrated. Miss Busk very properly criticizes a German author who, in collecting some Italian stories, has deprived them of their local colouring by translating the names of the mythological beings into those of the analogous persons in German legend. Perhaps it may not be equally misleading, but it certainly produces a sense of discord when we find a story professedly taken down from popular speech arrayed in the conventional trappings of literary English. The error is not carried to an offensive excess; but here and there it rather annoys us.

We have said enough, however, upon these points. The book, where it is devoted to its legitimate purpose, may help other travellers to interest themselves in the characteristics of one of the most remarkable populations in Europe. Nowhere else, it is probable, can we find so perfect a specimen of the survival of an ancient type amongst the discordant elements of modern Europe. The people of the Zillerthal, with their picturesque costumes, their national music, their passion for athletic exercises of all kinds, and their deep attachment to their old religion, are a race whom it is difficult to regard without some feeling of envy. If the democratic ploughshare could level the mountain-barriers which still keep the nineteenth century at a distance, it must be admitted that, whatever might be the material gain, there would be a heavy loss in the extinction of this characteristic type. It is natural to suppose that this conservative race, whose religious

ideas are still of the mediæval kind, must preserve popular legends with unusual fidelity. Miss Busk declares that one's whole surroundings are so religious in Tirol that the masses of frozen streams by the side of the railway "assumed in the half light such forms as Doré might give to prostrate spectres doing penance." An imagination full of crosses and chapels and votive offerings may easily turn any natural object into the resemblance of some religious symbol. A good many of the stories here collected belong to the general stock of Roman Catholic legend, and are marked at most by some superficial alteration to adapt them to local circumstances. Round every town there are shrines where some Saint was martyred or where some holy hermit lived in old days; and miracles of the usual kind assert the sanctity of the spot. They vary from stories of the most recent times to legends dating back to the early ages of Christianity; and, indeed, many of them are probably of earlier origin, and have merely received a Christian dress from their later narrators. The Virgin has appeared to lonely herdsmen or village maidens in the Eastern Alps as she has appeared to devout peasants in France. One of the most curious of the modern miracles happened in 1797. A girl was looking through the window of her father's cottage when she saw upon one of the panes an image of the Virgin. The neighbours were called in, and so much noise was made about the matter that a painter and two chemists were appointed as a committee of investigation. They said that the image had been originally painted on the glass and that the faded colours had been restored by the action of the atmosphere to which it was exposed. The people, however, stuck to the theory that it was of supernatural origin; and were confirmed in their belief by the disappearance of a pestilence and the retreat of the French army. Here we can trace a legend to its foundation. Elsewhere we have examples of a curious method in which an historical narrative becomes blended with older mythological elements. A legend tells how a peasant going home one night, after a convivial evening, found it convenient to sit down on a bank, and was surprised by the sight of the *Berchtl*, followed by a train of the souls of unbaptized children. One of these little ghosts was troubled by the length of its clothes, and the kindly peasant made a girdle for it out of one of his garters. The *Berchtl* promised him in return that his children should never come to want. Now this mysterious *Berchtl*, according to the Tirolese, is the wife of Pontius Pilate, who was pardoned for her intervention with her husband, but has to do penance till the last day by wandering over the earth. Sometimes, indeed, she is guilty of pitiful performances which are not in character with her supposed repentance. The comparative mythologists say that *Berchtl* is derived from a root meaning bright; and see in her the white goddess of winter. Now in 1651 a perfectly historical person, named Biener, who had held a high position in the government of the country, was executed owing to some very cruel treachery. His wife lost her senses in consequence, and escaping from her keepers wandered into the mountains. The people naturally say that she is wandering there still, proclaiming her husband's innocence; and as the *Berchtl* wanders about in the same kind of way, the two characters have become identified in the popular imagination. Elsewhere, a hermit of the seventeenth century has already got mixed up with a Saint of the fourth, who was in the habit of riding about on a bear. Miss Busk adds an appropriate anecdote of a little girl in a Sunday School, who, being asked the other day what David was before he became King, replied, he was Jack the Giant-Killer.

The religious legends, except in some modern touches, seem to show very little that is characteristic of Tirol more than of other Catholic countries. They are better preserved; but are not essentially different. The same is, of course, true of many of those popular stories which go the round of the world in slightly different shapes. Miss Busk gives us one story from the Italian Tirol, which is identical with that of the curious old ballad of Binnorie, where the harp made out of the bones of the murdered sister (it is a brother in the Tirolese version) tells the story of her death. Directly afterwards we are told as a legend the substance of the nursery-song about the four-and-twenty tailors who went to catch a snail. But not to dwell upon such familiar coincidences, it is perhaps rather disappointing to find that the wonders of Tirolese scenery have not made a more distinctive impression upon the character of the stories. There are of course some stories of the kind which give to various English places the name of Lover's Leap. The natural impression that a good leaper might jump a certain chasm has got itself translated in the popular mind into the conviction that somebody did jump it on a sufficient occasion. Then, of course, the mineral treasures of the mountains suggest a good many legends; but these are not peculiar to the mountains. If there is a "green-clad huntsman" near Innsbruck who guards a treasure buried in an old fortress, we naturally remember the green huntsman described in the introduction to one of the cantos of *Marmion*, who does just the same in the castle of Franchmont in Belgium. A small class of legends more distinctly belonging to the mountains are those which account for some curious rocky cleft. Wherever there is a hole in a cliff the natives appear to have been astonished, and in Switzerland they generally call on St. Martin, with his gigantic walking-stick for a perforating tool. In Tirol we find a more picturesque form of the legend, telling how a cleft was opened in a rocky wall to enable a Saint to escape from certain heathen persecutors. The legend, however, which seems to be most widely spread is one which is familiar to the Swiss traveller in the case of the Blümlis Alp. In that case it would be easy to rationalize. The impropriety of the name "*flowering Alp*," as

* *The Valleys of Tirol*. By Miss R. H. Busk. London: Longmans & Co. 1874.

applied to a snow mountain, is obvious. In fact, it doubtless was originally applied to the pasture at the foot, and the mountain is properly called the Blümlis Alp Horn. When, however, the name was extended to a snowclad peak, the explanation easily suggested itself that the mountain had once deserved its title, and had been cursed in punishment of some profanity of the herdsmen. We find, however, that the legend occurs in a great variety of places, and it may perhaps be interesting to students of glacier phenomena as pointing to the great changes which have taken place in the extent of the icefields within historical times. Miss Busk gives us several different versions. The best known case perhaps is that of the Dünenthal, a lofty and barren valley shut in by a mountain called the Gafforeno Wand. The legend here scarcely introduces any supernatural agency. It says that the people were punished for their extravagance by the gradual chilling of the country and freezing of the mountain wall; but the fact might very well have happened, though we may doubt the judicial purpose. Elsewhere, on the Hochsanger Alp, we have a more picturesque addition about a bright bird which warned the one virtuous man of the valley to escape before the rocks fell and crushed the offending race. But, not to go into further detail, we may perhaps say that the imagination of the people shows comparatively few traces of the striking phenomena of a mountain country; unless we prefer the hypothesis that Miss Busk failed to gather such stories because she kept too close to the beaten tracks. We suspect, however, that the other is the true state of the case, and that even the patriotic Tirolese are less impressed by the wonders of their dwelling-place than the traveller to whom those wonders have the additional charm of novelty.

GEORGE'S GENEALOGICAL TABLES.*

MONARCHY and aristocracy have their advantages, no doubt. Amongst the various merits of a monarchical form of government, it may be mentioned that the Kings' reigns serve as convenient, if not very scientific, divisions by which to date the laws and histories of the country. But, notwithstanding this and other claims to respect, there must have been moments in the life of every historical student when he felt that, however useful or ornamental kings and nobles may be, nothing could atone for the trouble which their genealogies give, and when he almost began to sigh for a Republican Utopia governed by gentlemen of the pavement who never knew who their ancestors were. It is not our intent here to preach a moral discourse on the evils of which genealogies have been the cause, or at least for which they have served as the pretext—to expatiate on the national misery brought about by the Hundred Years' War, the contention of the Houses of York and Lancaster, the French claim to the Duchy of Milan, the Spanish and Austrian Successions, and, latest case of all, the Franco-German War. Neither do we mean to take for a text "Is it my fault that I was Geoffrey's son?" and to dilate upon the private sufferings of those unhappy beings who in former days got beheaded, blinded, banished, consigned to life-long prison or perpetual surveillance, whose marriages were interfered with, and whose hearts were broken, because they had the misfortune to have some drops of Royal blood in their veins. We only speak now of the torment which genealogies cause to those who have to learn and to remember them. It is not every one who can run off a genealogical claim with the fluency of the captive Marquis of Lantenac, when he utters his fierce tirade against the Rights of Man:—"Qu'est-ce que vous nous chantez avec vos droits? Droits de l'homme! Droits du peuple! Cela est-il assez croux, assez stupide, assez imaginaire, assez vide de sens! Moi, quand je dis,—Havoise, seigneur de Conan II., apporte le comté de Bretagne à Hoel, comte de Nantes et de Cornouailles, qui laisse le trône à Alain Fergant, oncle de Berthe, qui épouse Alain le Noir, seigneur de la Roche-sur-Yon, et en eut Conan le Petit, aïeul de Guy ou Gauvain de Thouars, notre ancêtre, je dis une chose claire, et voilà un droit." We wonder how many people could say offhand why James I. objected to Arabella Stuart's marrying William Seymour, or why the De la Poles, Poles, and Courtenays were more dangerous than other English noblemen and gentlemen of their time. Indeed the English nobility, about whose real names, as distinct from their titles, people in general are very hazy, and whose titles passed from family to family with bewildering rapidity in the days when one of the privileges of nobility was to have its head chopped off on slight occasion, are particularly puzzling. Every Earl of Warwick is popularly taken to be the King-maker; unless an exception is made in favour of Guy, and even his name suggests rather the slayer of the Dun Cow than the genuine Guy who helped to cut off Piers Gaveston's head. Surrey the poet is not very distinguishable from Surrey the victor of Flodden, and "Achtophel" Shaftesbury passes for the author of the *Characteristics*. Then there is a large class—of whom Lionel Duke of Clarence, described with substantial accuracy by a child in one of Miss Yonge's stories as "the man that bothers one so about York and Lancaster," may be taken as a representative—whose sole or principal title to fame consists in their forming important links in a pedigree, and who are remembered chiefly as names with the dates of birth, marriage,

and death affixed. There are the complications and occasions for confusion brought about by second, third, and fourth marriages, which are enough to make one wish that the Vicar of Wakefield's great doctrine of monogamy had extended to and been accepted by the laity.

It is no doubt, quite possible to exaggerate the importance of genealogies, to be in fact in the mental condition of the above-mentioned Legitimist Lantenac, and we suspect that children are often unnecessarily tormented with the pedigree of kings and pretenders to kingship; but still genealogies are absolutely necessary to any one who studies at all minutely. Names, dates, and genealogies are "the dry bones of history"; but the author of the work before us gives another and less opprobrious turn to the well-known metaphor, taking it to imply "that they are the necessary framework without which history has no coherence, though they are to a great extent clothed with more attractive matter when history is treated as a whole." To the difficulty of retaining genealogies in the memory must be added in many cases the trouble of hunting them out through various books of reference. This labour at any rate Mr. George proposes to save to historical students by bringing together in one volume all the genealogies likely to be required in the study of modern history. "I have attempted," he says, "to include every reigning house the personal relations of which have been of any importance in European history, and every name of any historical note connected with those families." At the outset, nine tables are given to the History of England, including, besides the Royal Houses and their kin and kin, one of "the Nevills and Families connected with them." The King-maker and his house may well be thought almost as important as the Royal lines of York and Lancaster. In the table headed "The White Rose" we find "Henry, Lord Montague, beheaded 1538"; but we miss Montague's fellow-sufferer, Henry Courtenay, Marquis of Exeter. The descent of the Courtenays generally from Edward I. is indeed shown in an earlier table, but there is no notice of the marriage with a daughter of Edward IV. from which Exeter derived his York blood and in great measure his political importance. His son too, the Earl of Devon, merely by virtue of being an offshoot of the White Rose, came into sufficient notice in Mary's reign to entitle him to a place here. A little more help, too, might have been given towards the understanding of the Arabella Stuart complications. Arabella herself and her Stuart-Tudor descent are shown in one of the two tables which suffice for the modest needs of Scotland; but her husband, William Seymour, is not included by name among the descendants of the Duchess of Suffolk. Yet it was this descent from a daughter of Henry VII. which caused King James to look upon him as such a peculiarly dangerous match for Arabella. Except for these trifling omissions, the English tables are drawn up with judgment, and give a great deal of information, particularly with regard to the various noble families connected with the Royal Houses. We notice a few errors in dates, which are of course very liable to arise in a work of this class. Eustace, son of King Stephen, died, not in 1152, but in 1153; Geoffrey, son of Henry II., died neither in 1182 nor in 1196, both which dates are given, but in 1186; Henry Stafford, Duke of Buckingham, was beheaded, not in 1485, but in 1483; and Jane Grey met the same fate in 1554, and not in 1553. In cases where a man has married more than once, the wives' names are sometimes printed one below the other, a method which has the disadvantage of making all the children appear at the first glance to be the offspring of one wife. A closer inspection, however, will show that in almost all these instances figures are placed above the children's names to denote whether they were the issue of the first, second, or third marriage; and the omission of these in the table of the "Saxon Line" of Kings has the effect of making Kings Æthelbald, Æthelberht, Æthelred, and Ælfred all look like sons of Æthelwulf by his second wife Judith, whom he did not marry till seven years after the birth of his youngest son Ælfred. With respect to Æthelred the Second's first wife, who is here set down undoubtedly as "Ælfled, daughter of Thored," we may observe that both her name and parentage are matters of great uncertainty.

From England we pass to Germany, to which are devoted twelve tables, many of them full and intricate enough to make the student shudder as he reads. In the table of "The Welfs and their Connections" we note a rather serious blemish—a wrong maternal descent is assigned to the line of the Dukes of Modena and Ferrara. This House sprang from the marriage of the Marquess Azo of Este with Gersendis, daughter of Hugh Count of Maine, while from the same Azo's previous marriage with Cunegund, daughter of Welf, the House of Brunswick, as is here shown, derives its origin. But though Cunegund duly appears in the table, Gersendis is omitted; so that her son Fulk, ancestor of the Modena line, appears as a son of Cunegund, and therefore as a whole instead of a half-brother of Welf of Bavaria, Azo's son by the first marriage. Mr. George indeed warns us that he has occasionally omitted the names of "wives taken from obscure families." But he can hardly look upon Gersendis of Maine as of obscure family, or even as individually insignificant, considering the extent to which she was concerned in the revolt of Maine against William the Conqueror in 1073. The table, we admit, is constructed for the sake of the Welfs, and not of Maine or Modena; but though that would be a reason for omitting Marquis Fulk of Este altogether, it is no justification for giving him a wrong mother.

Next to Germany comes France, starting with Hugh the Great, for the Carolingians are very properly put down to Germany, so that no student of these tables will be in danger of taking Charles

* Clarendon Press Series. *Genealogical Tables Illustrative of Modern History*. By Hareford B. George, M.A., F.R.G.S. Oxford: at the Clarendon Press. 1874.

the Great for a Frenchman. In French affairs one might fancy the guidance of a Legitimist spirit had been followed, for, though Mr. George traces the elder branch of the Royal House down to the Count of Chambord, the Orleans branch is cut short at Louis Philippe, with only a sign to intimate "that there were descendants of whom no account is here given." This slight to the Count of Paris is the more marked because there is a blank space below Louis Philippe's name, which, as far as symmetry is concerned, would have looked better filled up. Considering the damage done by the Fusion to the prospects of the Orleans Prince, he might be granted the small favour of appearing side by side with Henry V. The Bonapartes, too, as a family which has played, and may play again, an important part in the history of France and of Europe, should have had a place accorded them. It is true that the great Napoleon and his son are allowed to appear, but only in the humiliating position of connexions of the House of Hapsburg. Though Mr. George thinks it necessary to trace a descent for Harold, son of Godwine, from Harold Bluetooth, the relationship between the First and the Third Napoleon is apparently of no consequence in his eyes. Yet Harold was certainly not made King of the English on account of any connexion with Danish Royalty; while Louis Napoleon did owe his Empire in great measure to the fact that he was his uncle's nephew. If the line of Bonaparte is ignoble, so was that of Sforza, which, however, duly appears among the ruling Houses of Milan. After France come five tables of the ruling Houses of the "Border Countries"—Counts and Dukes of Burgundy, Princes of Orange-Nassau, Dukes of Lorraine, Dukes of Brabant, Counts of Flanders, Namur, Hainault, Luxembourg, and such districts, whose very names suggest disputed successions, wars, treaties, and the Balance of Power. Last in this division comes the House of Savoy, after which Italy naturally follows. Under this head come the House of Anjou in Naples and Provence and the rulers of Milan and Florence—Visconti, Sforza, and Medici. Under the title of the Spanish Peninsula are included, beside the rulers of Spain, Portugal, and Navarre, the Aragonese princes in Sicily and Provence, and the Bourbon princes of Naples and Parma. It is a lesson in political history to see how the Italian princes have to be hunted out among Frenchmen, Spaniards, and Savoyards, amid the intricate and conflicting claims of rival dynasties. For the sake of those who have laughed over the rise and fall of Rabagas, and have traced the fortunes of Florestan, we rather desire a genealogy of the Princes of Monaco; but we own that it would not be of much practical use, and that we should probably be pained by not finding in it any information about that model of princely bearing and sentiments who was so sorely exercised by the *Crayaud Volant*. With the kingdoms of Central and Northern Europe—a large division, taking in Hungary, Poland, Bohemia, Scandinavia, and Russia—and the Christian dynasties in the East the genealogical tables end; but lists are added of the Popes, the Turkish Sultans, and the Caliphs, Mogul Emperors, and Shahs of Persia.

From this summary of the contents it will be seen that, with the exceptions we have commented upon, Mr. George has well redeemed his promise of including every reigning House in Europe whose relations are of importance to the student of history. The manner in which the tables are drawn up makes them generally clear and easy to follow, and their usefulness is much augmented by the addition of brief historical notes. The compiling of a work of this nature is a laborious and somewhat ungrateful task. Genealogies are hard to make out and to draw up, the liability to error is great, and the compiler gets much blame if he is wrong, and comparatively little credit when he is right. Supposing perfect accuracy to have been obtained, still success depends in great measure upon mechanical considerations, such as the clearness of the printing, and the convenience generally of the book for reference. In these points Mr. George has been well served. The paper is good, the print black and distinct, and the book opens readily. Those who have ever been irritated by a book of reference which stubbornly refuses to stay open at the place required know that, though this last merit is not of a very high order, it is nevertheless a great one as far as practical usefulness is concerned.

SLAVONIC LITERARY HISTORY.*

THE book now before us forms the first volume of a projected history of the literatures of the various Slavonic peoples. Its author may be supposed, judging from the form of his name, to be himself a Slav, and he fills the post of Professor of Slavonic Philology and Literature in the University of Gratz, in Styria. He possesses, therefore, qualifications for the task he has undertaken not often met with in a scholar who chooses to write in German; and as he has combined with his mastery over Slavonic material a thoroughly German method of working—patient, painstaking, and conscientious—he has produced a work about the value of which there can be no doubt. It remains to be seen whether he will be able to complete in a satisfactory manner the onerous task to which he has applied himself, but the present volume may be considered a decided success. Were it only for its ample lists of authorities on the various subjects with which it deals, it would be invaluable to all who occupy themselves with the antiquities of the different Slavonic peoples, and who are desirous of knowing

what has been written upon them of late years. But it can boast also of other and higher merits, offering to its readers not merely a pile of references or a crude mass of extracts, but a well-arranged series of results which testify to patient industry and critical acumen.

After a few remarks on the various schemes which have been propounded with regard to the classification of the Aryan languages, Dr. Krek turns his attention from the other linguistic families to the North-European branch which divided into the Teutonic and the Slavo-Lettic. After dwelling briefly upon the characteristics of those two sections, he then, discarding the former of them, follows the latter till its split into the Lettic and the Slavonic subdivisions. With p. 33 he begins to deal with the Slavs as an individual people. After a glance at the various opinions held by the learned on the vexed question of Scythian nationality, and some reference to the uncertain light thrown upon the early history of Slavonic settlements by the researches made of late years among tombs and other receptacles of antiquities, Dr. Krek proceeds to construct a picture of early Slavonic life deduced from the direct evidence of historic witnesses and the indirect testimony offered by language. Without committing himself to any decision as to the exact date of the earliest Slavonic settlements in Europe, he represents the Slavs as dwelling for a long period of obscurity in forests and other places which they found almost destitute of inhabitants, before they became to any extent familiar to the occupants of the neighbouring countries. The number of words for cattle and for corn common to the Slavonic peoples points to an early acquaintance on the part of the Slavs with a pastoral and agricultural life; the collective name for grain, for instance, being *jito*, a word radically connected with the Slavonic equivalents for "life" and "to live" (in modern Russian *жизнь* and *жит*, &c.). As a good illustration of the statement that much light is often thrown on the history of an object by its name, he discusses the various designations given to a foreign kind of grain, our buck-wheat. Not having been known to the early inhabitants of Europe, there exists no general European name for it. That it passed into some countries from Greece is proved by the Russian *grecha* and the Polish *gryka*; that the Tartars had something to do with it is suggested by the Bohemian, Polish, and Little-Russian *tatarka*, the German *Taterkorn*; to the Turks and Saracens point the Slovenish *turšica*, the French *sarrasin*, the Italian *saraceno*; to Heathens refer the Slovenish *hajda*, the Servian *hejda*, the Wendish *hejda*, the German *Heidenkorn*, and to Pagans the Bohemian *pohanka* and the Polish *paganka*. The Hungarians appear to have copied the Slavs, for the Magyar forms of the name are *hejduka*, *pohanka*, and *tatarka*.

Among the old Slavonians the ties of relationship were of great force, and in each household the head of the family ruled supreme, a patriarch whose dominion there was none to dispute. But of the despotic power of an individual over a tribe or race or nation there is for a long time no trace, and slavery, except in the case of prisoners of war, appears to have been unknown. So widely spread seems to have been the communal system that no words existed in early times to express individual property or inheritance; at least no such terms are now possessed in common by the Slavonic languages. Of the religion of the ancient Slavs little that is precise is known beyond the fact that it was a *Naturecultus*, a worship of the personified forces of nature, combined with a reverence paid to the spirits of the dead which appears to have amounted to a kind of worship of ancestors. That they believed in good and evil supernatural influences is evident, and the words by which they designated the two classes are used but with slight alteration by their modern representatives, as the names of God and the Devil—in Russian, for instance, *Boj* and *Bés*; but Dr. Krek discards the idea that the Slavs recognized anything like a Zoroastrian dualism, a contest between a White and a Black God, a *Béibog* and a *Chernobog*. Their mythology, like that of other kindred nations, was familiar with a conflict between the darkness and the light, the night and the day, as well as between winter and summer, the sleeping and waking or the death and revival of the earth. But he is of opinion that a special White God, in antagonism to a Black God, never existed, except in the minds of writers who looked back on the heathenism of their ancestors with Christian eyes. Of undoubted, unsuspected Slavonic gods, unfortunately, not much is known. The name of the supreme deity, Svarog, Dr. Krek thinks ought not to be connected with either the Indian Varuna or the Greek Ouranos, inasmuch as it is derived from a root *sur*, to shine (and is perhaps akin to *Surya*, the sun), but Varuna from *var* (*vari*), to cover, &c. Yet he admits that, so far as mythological meaning is concerned, Varuna and Svarog may safely be considered as near relations. Perun, the Thunder-god, he is inclined to admit as an original Letto-Slavic divinity, perhaps identical with the Indian Parjanya, rather than to consider him as a West-Slavonic imitation or adaptation of the Teutonic Thor. The vexed name of Svyatovit is discussed by him in a long note. He rejects Dobrovsky's explanation of his name, as meaning the "Holy Conqueror," as well as that which sees in it the "Holy Light," and he does not even refer to the suggestion that Svyatovit and St. Vitus are one. The first part of the name, according to him, means "strong," and the second he deduces from a root *ve*, to blow, Svyatovit having been properly a god of the winds. About such suspicious deities as Rigi, Mokosch, &c., he is utterly sceptical.

Of the inferior supernatural beings known to the old Slavs Dr. Krek gives a very interesting and valuable account. He leaves in uncertainty the etymology of the word *Vila*, the

* *Einführung in die slavische Literaturgeschichte.* Von Gregor Krek. Graz: Leuschner & Lubensky. 1874.

name given by the Servians to the fair but cruel nymph who haunts the mountain and the stream. Her sisters, the Russian Rusalkas, he thinks, may possibly have borne the same name in olden days, for which their present designation may have been substituted in Christian times. The Vampire myth he considers an old Slavonic conception, rejecting Hanusch's idea that it could not have originated among the Slavs because they burnt their dead; and he agrees with most philologists in looking upon the words which signify in so many languages a werewolf or vampire—such as the Greek *βερύκοιλας*, the Turkish *vurkolak*, the Albanian *vurkolak-u*—as being imitations of the Slavonic *vrkoldak*. We may take this opportunity of mentioning that, while he does not accept Fallmerayer's celebrated hypothesis that the modern Greeks are of Slavonic extraction, he looks upon them as a race in whose veins runs a by no means unmixed blood, a considerable Slavonic element having been absorbed and assimilated by the Hellenic inhabitants of a land which in many parts was at various times overrun by Slavs. The number of Modern Greek words which are of Slavonic origin is estimated by Miklosich at 129, and only seven of these are of universal prevalence. A much greater influence has been exercised on the language of the Hungarians by their Slavonic neighbours. About 846 Magyar words have been borrowed from Slavonian dialects, 32 among them relating to the Church, 37 to the State, 110 to the animal world, 150 to the vegetable, 40 to clothing, 48 to eating and drinking, and so forth. It is curious to see how far more accommodating in this respect Hungarian has proved than Greek.

While dealing with metamorphoses of words, Dr. Krok gives some interesting illustrations of *Volksetymologie*. The Slovenes, he says, declare that men were formed from the drops of sweat which fell from God's forehead upon earth. This idea was evidently suggested by the similarity between the word *chelo*, forehead, and *chelovek*, man. A Slovak legend tells how Christ and St. Peter were wandering afield one hot day, and the sweat of their brows fell in drops to the ground. St. Peter remarked that it would be a pity if they were wasted, whereupon Christ formed out of each drop a bee, and bees thus came into the world. The explanation of this legend is found in the close resemblance between *chelo*, the forehead, and a local word for a bee, *vehela*, or even *chela*. According to a similar kind of "folk-etymology" many names of places have been wrongly referred to alien sources. Thus Drenopolie offers a Slavonic aspect to observers who do not know that it is merely a corruption of Adrianopolis; and, on the other hand, Milbogen and Dürmann seem absolutely German until we learn that they were originally intelligible to Slavonic ears as Milbohov and Drmaly. Of Slavonic *Volksetymologie* also Dr. Krok gives some interesting examples. Thus a species of bi-coloured heartsease goes in Russia by the name of "Ivan and Maria," or the "Brother and Sister." The story connected with the plant is that a youth married a maiden whom he met in a foreign land. But, on questioning her about her lineage, he discovered that she was his sister; whereupon he and she became a flower, the brother blooming as its yellow petals, and the sister as its blue. In all Slavonic lands the wild thyme bears a name meaning the "Mother's Spirit." The Bohemian explanation is that a mother died and left behind her weeping orphans. And in her grave she mourned for her little ones, until at length her spirit came forth, and changed itself into a perfume-breathing floweret.

These legends lead us by a natural transition to the second part of Dr. Krok's volume, in which he deals with the folk-songs and folk-tales of the various Slavonic peoples. His familiarity with the numerous languages or dialects in which they are written enables him to deal with this subject in a most satisfactory manner, his notes teeming with valuable references. After giving a sketch of the various hypotheses relating to the origin of popular fictions, with especial reference to the well-known views of Benfey, Weber, &c., on the relations between the popular literatures of the East and West, as well as to the less familiar studies of Buslaef, Orest Miller, Stasof, Veselofsky, and many others on Russian songs and stories, he gives his own opinion on the subject of Slavonic popular tales and songs. They appear to him, not foreigners acclimatized in Slavonic lands, but primitive heirlooms of the Slavonic people, "ein uralter Besitz des slavischen Volkes." Even where a foreign element seems to betray itself, he is inclined to trace it, not directly to an Indian source, but to a unity of ideas in the mind of man itself. On this point we are not entirely of his opinion, deeming that the direct influence of the East on Slavonic popular fiction has been much greater than he is inclined to allow, but it is almost the only point on which we feel tempted to join issue with him. If he completes his book in the style in which it has been commenced, it cannot fail to prove of the highest value, a work well worthy of being set in a place of honour as a companion and supplement to Schafarik's *Slavonic Antiquities*.

PATRICIA KEMBALL.*

THIS novel is distinguished by qualities which entitle it to a place apart from the ordinary fiction of the day. It is not a mere kaleidoscope medley of characters and incidents thrown together, as it were, by a turn of the hand, but an acute and serious

study of certain phases of English society which the writer regards as especially characteristic of the temper and tendencies of the present generation. In speaking of it as a serious study, however, we must not be supposed to imply that it is a dull or heavy work. On the contrary, it is written in a very clear, lively, and interesting style, with a pleasant effervescence of satire and epigram rising through it like the air-bells in champagne, and displays genuine humour as well as keen social observation. Whatever may be thought of the artistic merits of this romance, it is impossible not to enjoy the intellectual vivacity which pervades the whole of it, and gives it its distinctive flavour. Some of the figures may be rather shadowy, and the startling development of the plot towards the close is certainly open to criticism; but enough remains of graphic portraiture and witty observation to furnish materials for half-a-dozen novels of the everyday kind. It is, in short, a book full of matter. The reader has the satisfaction of feeling that he is in communication with a writer who, however little he may sometimes agree with her, has really something to say, and who knows how to say it with point and spirit. A novel with ideas in it is certainly something to be thankful for.

The story opens at Barsanda, a little fishing village on the picturesque North Cornwall coast, surrounded by wide and rugged uplands and purple moors. The little community of fisher-folk represents society in its most primitive and unsophisticated form; and "everywhere there is movement, freshness, and the sense of life and freedom." Here Patricia Kemball, an orphan, has passed her early years under the care of her uncle, an old naval officer, who has taught her to be truthful, loyal, and unselfish, but otherwise has left her pretty much to herself and chance. She has had a little superficial schooling, but is sadly ignorant of elegant accomplishments and the niceties of decorum. She is passionately fond of boating, riding, and all kinds of outdoor exercises, and we get a glimpse of her scampering over the country with her flapping straw hat half-way down her back, and her long brown hair flying like a mane behind her. The old man dies suddenly, and Patricia is transported to Milltown. Instead of the wild open sea, she finds a land-locked, placid bay, shallow and uninteresting; every hedge and bank for miles round is trimmed and combed like a croquet lawn, and the whole face of the country has been smoothed down till not a vestige of natural beauty is left in it. The change in the external aspect of the scene is matched by a change in the conditions of social existence. From the breezy shore and the free and active life at Barsanda, Patricia passes into a sphere of dull artificial compression and elaborate restraint. It is the rule of Abbey Holme, where she goes to live with her aunt, that there must be no bustle, no noise, no quick impulsiveness or disturbing enthusiasm. Mrs. Hamley is a rigid disciplinarian who is anxious to be kind to her niece, but has no conception of being kind to any one except in her own stiff and uncompromising way. She has found suitable material for her system of regulation in a cousin of her husband's, Dora Drummond, who lives with her as an adopted daughter, and who humours her caprices, conforming to all her ways, and answering her like an echo. Dora has discovered that the most effectual means of exercising influence over Mrs. Hamley is to make things pleasant by always agreeing with her and doing whatever she desires. She is content to drift with the tide, backwards or forwards as the case may be, without attempting the slightest resistance. Yet, as presently appears, she has projects and secrets of her own, and what she cannot get openly she schemes to obtain in another way. From the description which is given of this interesting young person we might almost suspect mischief from the first. We are introduced to a fair young woman "with a small head round which are coiled and twisted innumerable braids of golden hair as small and glossy as spun-glass, blue eyes with light lashes, eyes that do not look straight and steady, but have the most bewitching little trick of shy observation, fleeting, half ashamed to be caught observing." After this the reader will perhaps not be surprised to find that Dora has a key of an old garden-gate, which nobody knows is ever opened, and holds midnight interviews with a young gentleman of the neighbourhood, to whom indeed she even contrives to be privately married.

As the story goes on, the honest, outspoken simplicity of Patricia is contrasted with the unscrupulous deceit of her companion, who retains her place in Mrs. Hamley's good graces by her usual methods, while Patricia is constantly getting into trouble through her candid impulsiveness. Her frank vigour disturbs the tranquillity of this quiet, over-regulated household, and Mrs. Hamley sarcastically remarks that when Patricia goes out of the room she expects to see sticks and stones whirling behind her as in the track of a high wind. She is full of generous affection and anxious to win her aunt's goodwill, but her attentions operate like an irritant instead of a salve. She disturbs sacred cushions lying on sacred sofas, plunges about for footstools, denudes corners of their appointed ornaments, and generally makes a "commotion of kindness." Mrs. Hamley is undoubtedly one of the best-drawn characters in the book. She is not at all an unkind or intentionally malicious woman, nor is she stupid. It is only her intense self-sufficiency that leads her astray. Her central creed, we are told, is the plasticity of human nature when taken in time and firmly handled. "There was one settled and unalterable way of right, to her thinking," and of course that was her own way. We have a capital sketch of her waiting for her husband when he is late for lunch. She will neither order it to be put off, nor sit down to it herself, but sits immovable with crisped lips and noiseless forbearance, and her eyes fixed on the clock, till Mr. Hamley

* *Patricia Kemball*. A Novel. By E. Lynn Linton. 3 vols. London: Chatto & Windus.

appears. He is punished by cold dishes which he knows might just as well have been kept hot, and by the meekly injured tone with which his wife rejects everything on the table—"I can't eat that, John, it is spoilt with waiting." Yet she is fond of her husband, too, in her own way; only she cannot resist the temptation to give him a taste of the discipline which she administers to the rest of the world. Great pains have also been taken with the character of Mr. Hamley, who is, if not the hero, the central figure of the story. He is described as a tall, full-fleshed man, with dark curled hair, and thick whiskers meeting in a fringe under the chin, black, keen, deeply-set eyes, a large obtrusive nose, and heavy lips which, when open, show too much of the gums. "In his showy attitudes and parabolic gestures, in the measured accents of his level artificial voice, in the glitter of the massive gold chain across his ample front, the sparkle of the huge diamonds on his large hands, in the cleverly drawn parting of his shining hair down to the tips of his shining boots, and in the superb fineness and glossiness of his clothes, could be read the self-complacency of the man and the success of his life." He is a self-made man, "and glories in his Maker." Born in a hovel, he has worked his way up to be the chief man in Mill-town by a combination of good and bad qualities, by industry and business talents on the one side, and by cunning and servility on the other. Having set out in life with a determination to conquer society, he is careful not to offend it. "No one could remember an offensive word from him against his social superiors or the institutions of the country." With all his egotism, however, he is not unscrupulous. Self-respect makes him anxious to do the right thing to everybody, so that there shall be no risk of tarnish to his reputation. He married his wife, who was much older than himself, not for love, but because he wanted to get upon a higher social platform, and she was an Admiral's daughter, and was recognized in good society; but he has always been true to her, and has shown her every mark of respect and attention. On the other hand, however, this has not prevented his cherishing the thought of marrying Dora when his wife dies, as in the natural course of things she, being now an elderly woman in weak health, may be expected to die before long. He is content to wait, and he waits loyally and quietly, without giving any sign of his hopes. Though the man himself is coarse and vulgar in the grain, there are subtle and delicate touches in this picture of him which show a true perception of the complexities of human nature.

The leading idea of the story, it will be observed, is the conflict between the impulses of a sincere, fresh, and unsophisticated nature and the pretences and restraints of artificial society, and the description of this struggle is the best part of the book. Patricia in the end breaks down in the unequal contest. Touched by Dora's soft and sympathetic attentions, she unconsciously becomes the agent of the designing girl in passing a forged cheque, and, when the fraud is detected, refuses to say from whom she received the cheque. The Hamleys are in perplexity, and do not wish to bear hardly on her; but they do not know what to think. Patricia's life under the cloud of suspicion and disgrace becomes intolerable. She therefore seeks refuge with some friends in the village who believe in her innocence, and, after a time, marries a young sailor who had been her playmate at Barsands and who now opportunely reappears. While virtue is thus cast into the shade, Dora is triumphant in her wickedness. She is secretly married to Sydney Lowe, but when Hamley, immediately after his wife's death, proposes to her to become the mistress of Abbey Holme, she fondly accepts, and trusts to chance to enable her to escape from a perilous dilemma. The knot is cut by Sydney meeting Hamley in a wood and killing him by a sudden blow. Hamley had previously made a will, leaving all his wealth to Dora, and she and Sydney now share it together, with outward honour, but with wasting remorse at heart. A poacher who is found near the body of the slain man is hanged for the murder. Up to a certain point the character of Dora is finely drawn; her steady selfishness, her soft petting ways, her childish trust in things somehow turning out all right, and her readiness to take any side that suits the purpose of the moment, make up a portrait of which the counterpart may be found in real life; but her audacity is scarcely consistent with the general weakness of her nature, and her utter want of any kind of moral sense converts her into a fanciful creation. Of the other characters there is little to be said. The Lowes, father and son, are clever outlines only, which require filling up. There is an obvious artistic error in giving us only a glimpse of the young sailor, Patricia's devotion to whom is supposed to be her mainstay during her troubles; and the episode of the peasant proprietor, Garth, who is sold out of his farm, becomes poacher, and is hanged in error as Hamley's murderer, is rather clumsily and unnecessarily introduced as an excuse for one of those fantastic assaults on political economy in which Mrs. Linton is so fond of indulging. On the whole, the best parts of the book are its social pictures, which are sharp, vivid, and amusing.

MAYERS'S CHINESE READER'S MANUAL.*

CHINA is a land of traditions. Its great antiquity as a nation, and the long roll of its history, have bequeathed to it a larger legacy of famous names and great or infamous deeds than

* *The Chinese Reader's Manual: a Handbook of Biographical, Historical, Mythological, and General Literary Reference.* By William Frederick Mayers. London: Trübner & Co. 1874.

has fallen to the share of any other Empire. The mystic religions also which have held sway over the minds of the people for so many centuries have added, by way of supplement to the historical annals of the nation, a large quota of legendary literature, full of the sayings and doings of whole armies of gods and goddesses, of saints and ascetics, borrowed from the Indian mythology. Thus every Chinese writer has at his hand an inexhaustible fund of tradition from which he may draw illustrations, point warnings, or incite to noble deeds. At the same time the system of national education, which turns the mind of the student backwards instead of forwards, which holds up as examples of the highest excellence the sayings and doings of the sages and statesmen of antiquity, and which forces into action the memory rather than the intellect, tends to encourage in every book, in every essay, and in every poem references to the historical characters and events which form the principal study of all Chinese scholars.

Among European writers the practice of drawing illustrations from early historical or legendary sources is but an incident of style, but with the Chinese "it takes," as Mr. Mayers observes, "the character of a canon of literary art." So inexorable are the laws which bind Chinese authors to follow abjectly the footsteps of the ancients, that all independent flights of fancy or trains of thought are crushed out, and a dead level of stilted plagiarisms unrelieved by a single new idea or fresh expression is all that is left to represent the modern literature of the country. Thus forbidden to make any independent efforts towards excellence, they devote undue attention to petty tricks of style, and vie with one another in introducing allusions to historical and legendary events in intricate profusion. No one can read many pages of any Chinese work possessing pretensions to style without meeting with more or less covert references to the beauty of some Si She, the patriotism of some Su Wu, or the depravity of some Ta ki, all of which, being stock illustrations, are perfectly intelligible to every trained Chinese scholar, but are so many stumbling-blocks to the foreign student. It is true that biographical dictionaries contain the necessary information to make these plain, but it does not fall to the lot of every one to be within reach of the British Museum; and even if it did, the wearisome intricacy of the arrangements of Chinese books of reference is such as to deter any but the most resolute students from attempting to dive into their pages. The system on which they classify the contents of their encyclopedias, and the phonetic arrangement which rules the compilation of most of their biographical dictionaries, defy analysis. Who, for instance, would ever think of looking for the article on tigers under the heading of insects? or who would expect to find the syllables *say, chuh, or lan*, arranged as rhyming with *chi*, when by the light of modern dictionaries other headings point to far more appropriate classification? The explanation of these last apparent inconsistencies is that modern editors insist on ignoring the changes which have gradually come over the pronunciation of the language, and on retaining the phonetic arrangement of the characters which was established when their sounds were first subjected to analysis. This is, no doubt, a fault we might expect to find among a people to whom every new invention is abhorrent; but let us hope that the introduction of steamers on their great water ways, and of telegraphs on their shores, will teach them enough of the value of time to induce them to adopt some system which will tend to lighten the labours at present imposed upon students by the clumsy arrangement of their books of reference.

The difficulties we have spoken of are best appreciated by those who have devoted most time to the study of Chinese literature, and to such the appearance of the work before us will be welcome. Mr. Mayers is one of the best Chinese scholars of the day, and he has enjoyed opportunities of study which may be envied by his less fortunate fellow-labourers in Europe. Of these opportunities he has taken every advantage, as the very wide range of reading which is implied in the compilation of his *Chinese Reader's Manual* fully proves. In it he has brought together from many and various sources "an epitome of historical and biographical details," together with a most useful list of many literary expressions which, unintelligible in themselves, become full of meaning when explained by the light of the event or legend from which they take their rise. The biographical portion of the work is compiled with great care and discretion, and embraces almost every Chinese celebrity of every age from the great Yu, who drained off the waters of the flood, to Hung Siu-tsuan, the leader of the Tai-ping rebels, and Tsêng Kwoh-lan, the late celebrated statesman and Viceroy. The details furnished in each case are full and accurate, and taken together they form a most interesting general picture of Chinese history. In them are reflected the rise and fall of the various dynasties, the revolutions which have from time to time shaken the Empire to the core, and the intrigues, common to all Oriental countries, of statesmen, favourites, and Court ladies recorded in the long drama of Chinese history.

In connexion with this part of the work Mr. Mayers has added a very useful index at the end of the volume, which will be of material value in enabling students to recognize the names of scholars and statesmen in the various disguises under which they appear in Chinese books. For, in addition to his patronymic and cognomen, every Chinaman of position adopts on his arriving at man's estate a literary name by which he is usually designated in familiar parlance or in literature. In addition to this he commonly takes one or more pseudonyms which he employs as *noms de plume*, and after his death, should he be considered worthy, he not unusually receives a posthumous title. By any one of these appellations a man may be designated, and hence the diffi-

culty of identifying authors and men of note is often considerable. To take one instance, the celebrated scholar *Mao K'i-ling* is very frequently spoken of in books as *Si-ho*—literally, Western river; and should the student be ignorant of this pseudonym, he has no means of discovering the patronymic of the person referred to. If he turns, however, to the character *Si* in Mr. Mayers's index, he will be at once referred to an entry on page 151 which contains the information that *Si-ho* was a pseudonym adopted by *Mao* whose cognomen was *K'i-ling* and whose literary name was *Tu-ko*.

In order to afford some idea of the explanations given by the author of the historical allusions so commonly met with in Chinese literature we will quote an entry taken at random from the first part of the work:—

Hung Yeh, the red leaf which led to a happy union. It is related that in the time of T'ang Hi Tsung, A.D. 874-888, a youth named Yu Yeh happening to pick up a crimson leaf which had fallen from a tree near the palace, idly inscribed upon it a quatrain offering his greeting to whomsoever might find it, and cast his billet into a stream which ran through the Imperial park. Here the leaf was wafted to the feet of a lady of the Court, who wrote a responsive verse on a similar leaf, which she threw into the brook, and which was carried by chance to Yu Yeh's hands. Shortly afterwards three thousand of the palace ladies were allowed, owing to the various disorders then prevailing, to seek husbands beyond the walls of the seraglio, and Yu Yeh, discovering the fair one with whom he had corresponded, became united to her in marriage.

The value of such an explanation is obvious. Without it the Hung Yeh would be to the student a red leaf, and nothing more, and thus the whole sense of a passage would be lost to him. So also in the case of the next entry. "The catastrophe of the red sheep" would be a hopeless enigma to a translator unless he had within his reach the information that the expression was intended to signify a period of great disaster. In fact, until now one or more of the vast and ill-arranged encyclopedias has been a necessary adjunct to the dictionary of the student. For the future the *Chinese Reader's Manual* will for all ordinary purposes be sufficient, and the relief of exchanging the unwieldy Chinese tomes for Mr. Mayers's handy little volume will be great.

The second part of the work is devoted to the elucidation of what the author calls the "numerical categories" so frequently employed by Chinese writers:—

In obedience [says Mr. Mayers], it would seem, to an impulse the influence of which is distinctly marked in the literary traditions of the Chaldeans, the Hebrews, and the Hindus, a doctrine of the hidden properties and harmonies of numbers imbues the earliest recorded expressions of Chinese belief. . . . The dual form of animated life, the succession of the seasons, the alternation of day and night, the revolutions of the visible planets, may not improbably have given rise to a conception of numerical harmony obeying some mysterious and unchanging law, when contemplated by minds striving after the rudiments of knowledge, and absorbed in attempts to fathom the causes and order of existence.

This practice, which began by arranging numerically such things as the attributes of gods and men, the various forms of existence, and the heavenly bodies, is now applied to almost everything capable of division, and is used in a way which presupposes on the part of the reader an acquaintance with the historical part of the language which very few foreigners possess. Explanations are necessary, for instance, to make plain that such expressions as *San k'ear*, or *See shuh*, which mean literally "the three regions" and "the four arts," refer the one to the Taoist three regions of existence—namely, the Heavens, the Earth, and the Water; and the other to the four subjects of study during the Confucian period—namely, the Book of Odes, the Record of Rites, the Book of History, and the Book of Music. To help to clear away these difficulties, Mr. Mayers has brought together from native works bearing on the subject a fairly complete collection of these numerical categories, and has added to each a full interpretation of its meaning.

To these two parts the author has added a chronological list of the Emperors of China from the dawn of history to the year 1862, and has thus completed a very useful handbook on a very difficult subject. In justice to Mr. Mayers we are unwilling to close this notice without again bearing testimony to the erudition and care displayed by him in his present work. When the great difficulty, even to practised scholars like Mr. Mayers, of reading Chinese books written in all varieties of style is remembered, the fact of his having ransacked so large a section of Chinese literature from which to gather his materials marks him as a man of great industry as well as of extensive scholarship. The book is a thoroughly good one, and we confidently recommend it to every student of Chinese literature.

WALKER'S "ORIGINAL."

IT hardly needed a prefatory Memoir by Mr. Blanchard Jerrold to enhance the intrinsic interest of Walker's *Original*. Walker's father, it seems, as borough-reeve of Manchester, took a prominent part in the opposition to Pitt's Eustian Tax in 1784, and suffered for his independence and public spirit in various ways. For ourselves, however, the sketches of the father and son, prefixed to the *Original* proper, are chiefly interesting as showing not so much that "fortes creantur fortibus et bonis," as that the courage and rough good sense of the sire were mellowed and toned by education and reflection in the son. "Jacobin" Walker's lines were cast in stormy places, for which he was specially suited, while his son's more pleasant path lay in the direction of

social experiment and improvement. The scantiness of the materials which Mr. Jerrold has got together is shown by his being able to justify the reputation of the father as a humorist only by a solitary story of his putting himself in the place of a follower or policeman, and obtaining a turkey's leg from the benevolence of an "area-belle," and by his "being driven to semi-allegorical introductions of "Porcus" "Jack Styles," and "our friend Wayward" to represent the opposition to the other Mr. Walker's high-health views. The truth is that the *Original* owes so much of its charm to its being purely introspective, and the writer's illustrations and experiments so unaffectedly introduce himself, that it enables us without going further to picture to ourselves very distinctly the police magistrate who divided himself between laborious days and social evenings, and who endeavoured to promote the public weal by practical experiments as to the diminution of pauperism, and also by practical attempts to simplify the science of "gastronomy," and who, by force of a pleasant style, well-chosen topics, engaging candour, and thorough *bonhomie*, succeeded in floating and keeping afloat, as long as he cared to do so, a weekly periodical which would have been creditable to a confederacy of writers. But if there is little in the introductory part of the new edition which might not be learnt from Hono's memoir of the father, or from the son's references to himself in the papers which are his standing memorial, it is not the less a welcome fact that the *Original* has reached a third edition. Stray second-hand copies have always commanded a high price, and personal experience has taught us that no borrowed book has been more difficult to recover. It is possible, therefore, that the new library edition will be gratefully received.

It might be too much to say that Walker from the beginning of his publication fully contemplated the sort of classical position which was in store for it, though his programme embraced the treatment of "whatever is most interesting and important in religion and politics, in morals and manners, and in our habits and customs," and though his aim was "to set before his readers an alternative diet of sound and comfortable doctrine." But within three months it occurred to his correspondents "to wish him all the success of the *Spectator*, *Tatler*, and *Guardian*;" and in truth the chief distinction between the *Original* and those earlier and more famous serials lies in the more practical and work-a-day tone of the former. Not that Walker is deficient in humour, or wit, or pleasantry. His writings display all these qualities combined with a genuine philanthropy and a transparent candour which make them interesting alike to the would-be reformer of society and to the casuist who delights in self-inspection. Every now and then he indulges in a quiet irony, as, for instance, where, on the topic of Domestic Economy, he combats the objection to cottagers having orchards "as affording a cover for stealing and selling the farmers' apples," by the argument that "robbing orchards would probably be held in greater disrepute when some of the class who are now the offenders might themselves suffer from the practice"; or where, as a plea for Clubs, and in reply to the objection of the ladies that they are anti-matrimonial and adverse to domestic habits, he suggests that "they are a preparation, and not a substitute, for domestic life." He has a keen eye, too, in his anecdotes, for the ludicrous, as in the story of the Cambridge Wrangler's attempt to cross the Alps mathematically resulting in broken bones. The form and size of the weekly issue admitted of what now would be called "occasional notes," and there is scarcely one of these which does not supply an illustration or a *mot*.

There is no denying that the fame of the *Original* has rested hitherto on the essays on the "Art of attaining High Health" and the "Art of Dining." Perhaps it has even been heightened by the knowledge of the fact that one who had reduced both these arts to a matter of the nicest adjustment and certainty, so that he could afford occasionally to exceed, and who lived without medicine, without greatcoat, without fear of weather for sixteen years, did no better than less regular men, and died at fifty from damaged lungs and liver. He was not the man to endorse the cant phrase "Do as I say, not as I do"; he believed that he had mastered the secret of physical self-knowledge; but he miscalculated the powers of his machine. To those who avail themselves of a fresh opportunity of studying the *Original* its author will, we suspect, appear quite as sagacious on questions of pauperism, parochial government, thrift and domestic economy, savings banks, and such like topics, as on those directly affecting his stomach and his digestion. As to the latter, social changes have made some remarks read like anachronisms; but it is curious to find how much of what he lays down as to the former is in accordance with our most successful social reforms. His remarks on the Regulation of Charity foreshadowed a reform which a partial attempt has been made to carry out. His hints as to the teaching of domestic economies (ii. 74-5)—

To market and make purchases on the most advantageous terms; to apply the arts of cookery to preparing food in an economical, wholesome, and palatable manner; to brew and bake; to light a fire expeditiously and economically; to keep a fire economically; to make a fire cheerful economically; to set out the table quickly and neatly; to clear away expeditiously; to cut out, mend, and make linen, and to keep other clothes in good order; to wash and get up linen; to sweep and clean rooms, and to keep them neat and comfortable—

are anticipatory, by a score of years at least, of the movement in favour of the teaching of "common things." With peculiar opportunities of observation Mr. Walker arrived at the opinion that it was of little or no use to attempt to eradicate depravity when once contracted, that prison discipline was powerless in the way of reformation, and that the true and Christian way to deter from

* The *Original*. By Thomas Walker, M.A. Edited by Blanchard Jerrold. 2 vols. London: Grant & Co. 1874.

crime was to make the sweets of liberty and independence more patent and attractive. Along with such views would naturally follow a dead set against pauperism. In his experience there was no such thing as *isolated destitution*; and he held more strongly than even many of our present social reformers that there is nothing so demoralizing in its tendencies as casual and indiscriminate charity. He did not believe in the cry of "we've got no work to do":—

There is a market for all sorts of services at all sorts of prices. Individuals of defective intellect have a value at a certain class of public-houses by way of butt, and very often at farm-houses, for something of the same reason, and to have thrown on them the lowest and most disagreeable offices. Lameness is a good guarantee for faithful discharge of duties of a stationary and gentle nature, and age the same. Misfortune is often a sort of fortune in obtaining a preference for pity's sake, as a person with one arm will be selected from a number of competitors to hold a horse. If all persons felt obliged to hawk about their services for the best price they could get, all persons would be provided for.—*ii. p. 191.*

There is little doubt that the police magistrate based this belief on a very copious induction. As regards parochial government, he is in favour of the principle of self-government by small communities, as calculated to call the social principles into action. His development of the "Prytaneum" plan would doubtless scandalize modern purists and reformers; but there is a good deal in what he says elsewhere:—

You must either have tavern bills or attorney's bills. The public has no way of being so well served as by furnishing good cheer, though the public, or those who call themselves the public, do not seem to think so just at present.—*ii. p. 330.*

But, to come to his best known articles on the Art of Dining, the Art of Travel, and the Art of attaining High Health, it is evident that their piquancy is due to the mixture of sound sense and truth at bottom with a dash or two of extravagance and enthusiasm. It is unnecessary to accept all the marvels which he connects with a perfected digestion, although one may clearly discern the dependence of mental and bodily alacrity with its opposite, nervousness, upon the healthy or unhealthy state of the digestive powers; and although to the same disposing cause most men would refer ease and spontaneity in composition. "The difference," writes Mr. Walker, "between the best and worst humour for composition is like that between a salient fountain and a crazy pump in a deep well." If it be so, the gain of a good digestion is worth seeking, even if it fall short of the bodily purity (under adverse conditions) which Dr. Gregory confirms Mr. Walker in declaring to result from the active exhalation from the surface of an animal in perfect health, and of which the outward sign with the author of the *Original* was a clean foot and stocking, though the road traversed were ever so dusty. The way and means lay in a strict dietary till the constitution was brought into trim. Moderate and timely rations of food were to be accompanied by sips, not gulps, of liquid, whether stimulant or otherwise. On Shakspeare's principle that "unquiet meals make ill digestions," disagreeable subjects were to be banned from the meal-times, and agreeable topics chosen in order to stimulate the salivary glands by promoting mastication. Early rising, unhurried dressing, ample preparation, and exercise short of fatigue, are prescribed as conducive to the good digestion which, according to Walker, has more influence on the feelings than the heart, to the door of which so many sins are laid; but, before all else, we take it, he would have prescribed a social meal, as distinguished on the one hand from the solitary repast, and on the other from the set or state dinner or breakfast. As animals which have been used to feed in company fall off if placed alone, so, our essayist argued, and not without a good show of reason, solitary meals generate indigestion, and where they are inevitable the evil should be minimized by prefatory relaxation of the mind, and by such methodical service that everything should be ready to hand, and nothing have to be waited for. It is evident, too, that equally objectionable to Mr. Walker's taste was the "set dinner," for the most unpractical of all his suggestions in the "Art of Dining" are two which are intended to mitigate the objections to numerous company on the same day. He proposes, first, to divide them into two or more tables; and, secondly, to let one section of a family entertain their guests at four o'clock, and another detachment hold its feast at the same table at seven, all meeting in the drawing-room at a later period of the evening. It is hard to see how the one scheme could be compassed without duplicate hosts, or the other without a succession of cooks and attendants. But the author of the *Original's* heart (or, as he would have maintained, his digestion) was devoted to the social meal, and—barring one or two crotchets—he will always be regarded here as a great authority. How sound are his dicta about lighting and laying the social dinner-table! Instead of cumbrous branches on the table, a subdued light should be shed on it, as in some of Rembrandt's paintings, either from the wall, or, as he prescribes in reference to a winter dinner party of nine or seven, by seating two or three on each side of the table, the host at the top, and at the bottom only the fire with the lights on the mantelpiece. By this method a capital light is obtained, and, as Mr. Walker puts it cheerily, "the fire is made one of the party." And then as regards the adjuncts of each course; how convenient to have the decanters to your hand, and duplicates of the lobster sauce, cucumber, and cayenne, and Chili vinegar within reach, and without risk of collapse in the process of handing over your shoulder! Something of this convenience is realized in the reduplication of cream jugs, sugar basins, and the like at modern breakfast-tables. Every dish, says our Amphitryon of 1835, should

be served with its proper accompaniments and its appropriate vegetable, a pause intervening between each for wine and talk. With an eye to the repast and not to the pageant, the woodcock should precede the joint, and the wines be circulated early in the meal. "Where the champagne goes right nothing can well go wrong." There are some absurdities, we grant, in his excessive theory of "self-helping"; e.g. where he recommends a bread-basket for a centre-piece; and some complaints are laid at the door of State dinner-parties, which no longer apply; for example, the ignorance "what there is to eat" is obviated by the fashion of "cartes." But, after all this lapse of years, Mr. Walker's instincts as to dining and catering (socially, and not in state) are as wholesome and sound as ever: and though we may not be prepared to forego, in the adoption of his views, the dinner *à la Russe*, which was undreamed of in his earlier philosophy, the details in these pleasant volumes of his menus "for three" on Christmas Day, "for six" in the Temple, and for seven or eight at Blackwall, convince us that a man might do worse than take part, whenever he has the chance, in a dinner *à la Walker*.

VANESSA.*

THOSE young ladies whose delight it is to read about falling into love and out of love may possibly find some pleasure in *Vanessa*. There are in it three heroines who are seven times in love; who have, if we are not mistaken, eight proposals made to them, though not always from the seven gentlemen from whom they would have desired it; and get four times married. The leading heroine, Amy Mertoun, is first in love with Dennis O'Brien, then with Lord Alan Rae, whom she marries. On her widowhood she is again in love with O'Brien, who is no longer in love with her, and last of all she is in love with George Charlton, who happily is in love with her. Her sister Helen is far more constant, for all through the story she is in love with O'Brien alone, though he for a long while is in love with Amy. She has meanwhile a couple of lovers to console her, though, being of a scientific cast of mind, she cares far less for them than for the beetles of which she is making an interesting collection. The cousin of these two young ladies, Eva Mertoun, is in love with Lord Alan, but fortunately for her she is jilted by him for her prettier cousin Amy. Falling out of love with him, she presently falls into love with her cousin Henry, the brother of Amy and Helen. So Lord Alan is in love, so far as a wicked nobleman who has a taint of insanity in the blood can be in love, first with Eva and then with Amy. Dennis is in love first with Amy and then with Helen, while poor Henry, having only one cousin but two sisters, has no choice but to be constant. As for George Charlton, we take no account of him. He is brought in just at the end, that Helen might discover that O'Brien is no longer in love with her sister Amy, and so might desert her beetles and show her long-concealed affection. Even without the wicked nobleman there is, as our readers will admit, a very liberal allowance of love-making for two volumes. With him thrown in, the author might, if she had pleased, with the greatest propriety have made her tale half as long again. These stories in two volumes have, we are ready to admit, certain merits of their own. We think, however, that the respect which is due to the aristocracy requires that when a marquis's family is introduced a third volume should always be added. More especially is this the case when it is a family that has had a taint in its blood for many generations, and can boast of men who are nearly all vicious or insane. We would as soon see an heir to a marquise on his marriage-day drive off with his bride with only a pair of horses to his carriage as have him make love in only two volumes.

The two heroines, Amy and Helen Mertoun, are the daughters of a widow lady who has been left in very reduced circumstances. Helen accepts her lot cheerfully; but, as she remarks to her mother, "Amy never seems quite congenial with the family atmosphere." Her mother, by way of apology, replies, "Poor child! she is able to remember when the atmosphere was very different." Amy has a young lover, Dennis O'Brien, who is scarcely more satisfied with his lot, but soon announces, "I am perhaps absurdly elated at the prospect of being transferred to a more congenial atmosphere." He gets into a more congenial atmosphere by being transferred from "bank drudgery" to the curatorship of a museum, while she at the same time also gets a change of atmosphere, as she goes to live with a rich uncle as a companion to his only child Eva. O'Brien, in the elation produced by this atmospheric change, pointing out to her that the museum is close to her uncle's house, exclaims, "The Fates have ordained that we should not be separated." She, however, has her doubts whether her rich uncle will care to see her poor friends, and says, "I shall not venture to invite my acquaintance to his house." O'Brien replies in a speech not unworthy of the immemorial stage-lover. "True, your acquaintance. I should decline to enter his doors if I am to be designated by so cold a term. But what if I come as your affianced lover?" Amy lets him know that their positions are changed with the atmosphere, and that their "present relations cannot continue." "I understand," said Dennis, fixing his eyes on Amy with an expression of indignant scorn, before which she quailed; "we are to exercise the right of free choice in our separate spheres." This scene occurred in a walk in the country, where her young brother and sister had gone with them to play

* *Vanessa*. By the Author of "Thomasina," "Dorothy," &c. 2 vols. London: Henry S. King & Co. 1874.

propriety. The boy was as fond of natural history as O'Brien himself, and at this moment came running up to ask if he had found any specimens. "Remember," he said, "that you promised me the first Painted Lady of the season." Nothing could have come in more pat to bring the first act to a close, and O'Brien shows that he can profit by such an opportunity. "This is not Vanessa Cardui, but a new variety," he said, "a Painted Lady which has just left the chrysalis and intends to soar above us earth-worms." "Where is it? Let me see; have you let it go?" said Dick, surveying O'Brien's empty palm with a puzzled air. "I have let it go," repeated O'Brien quietly.

Amy goes to her rich uncle, and at once plunges into fashionable company. Among others she meets with Lord Alan Rao, who has been paying attentions for some while to her cousin Eva. He can talk as well as the rest of them, and Amy, as she overheard "a dialogue" between him and Eva, must have felt that, while as an heir to a marquise he was so much superior, as an orator he was not inferior even to Dennis O'Brien. "Her exuberant energies," he says, in speaking of his aunt Lady Cecilia, "absorb the vital forces of those with whom she comes in contact, leaving my spirit altogether arid; but under cover of your music the sponge is removed, and I am myself again." Presently he begins to find Amy more attractive than Eva, and deserts the one cousin for the other. Mr. Mertoun learns for the first time that he has been paying attentions to his daughter, and, aware as he is of the taint of blood in this noble family, and of the insanity or viciousness of all the male members, forbids her to think anything more of him. Everything therefore favours Amy. Her sister Helen meanwhile comes to visit her. Though this young lady is but sixteen, she can talk as well as his Lordship or as Dennis O'Brien. "It is a grand resource," she says, "to have a definite pursuit. Botany and beetles will satisfy my aspirations for the next ten years." She does not get on well with her more worldly-minded sister. "The truth is that Amy and I survey life from different planes, and you cannot live with such an uncongenial pair of sisters for six weeks without being disabused of your ideal of family harmony." Her cousin Eva, who is at least one year older, is not unworthy of her. "Life," she says, "is a series of disillusionings; one more or less cannot signify." We are not surprised that "Amy never seemed quite congenial with the family atmosphere" - if, that is to say, in the family atmosphere the family talk is included. By her love of beetles and of fine words Helen is clearly marked out for Dennis, though, as she is only sixteen at the time that we are writing about, she has to wait till the very end of the novel before even a proposal can be made her. When her sister meets her at the station to take her to their uncle's house, she says:—"I began to work my fingers into the trammels of civilization when I reached the Bixley Junction, in order that I might display them to you in unsullied glory." When this is translated into unheroic English, it means that she had not put on her new pair of gloves till her railway journey was close at its end. No wonder that the fashionable Amy, if she admired the language, yet scorned the carefulness, of her younger sister:—

Amy smiled at the thought that if Dennis O'Brien were destined to be the crumpled rose-leaf in her lot, any annoyance he might cause her was cheaply purchased by her immunity from such sordid economies. She laid a disapproving finger on Helen's neck-tie, the only article of her dress, with the exception of the gloves aforesaid, which bore any appearance of newness, and asked "Where did you buy that gaudy thing? It goes very ill with your dress."

"I did not buy it at all, Amy: it was an offering of esteem and regard from Mr. Benson, when I went about my last lot of work. I had an impression that it was rather vulgar, but as he assured me it was a sweet, genteel thing, I could not hurt his feelings by declining the gift."

"At all events you might keep it for Allerton church; you will not meet Mr. Benson here."

"That is true," said Helen, as she took off the obnoxious ribbon and slipped it into her pocket; "you see how amenable I am, but you must not be too critical of my manners and appearance, or I shall become still more awkward than I am by nature. Is not this Swiss cottage which has broken out in chinquies the lodge to Leasowes? please put my bonnet straight while I compose myself into a becoming attitude of lady-like ease, and assume my very properest behaviour."

The two sisters have a brother Henry, not unworthy of them, who made remarks sardonically. He is a bosom-friend of Dennis, who confides to him that "the glamour of the old days has departed," and a determined enemy of the wicked Lord. This misguided nobleman, however, is in the end of the greatest service to both the young men. For, if he had not made love to Amy, she might have become reconciled with Dennis. In that case he would not have married Helen, who, from her taste for big words and beetles, alone was worthy of him. And if he had not run away with Amy, he would have married Eva, and so Henry would have lost his wife. When Mr. Mertoun first suspects an attachment between his daughter and Lord Alan, he sends her away with Amy to Swanage. Eva, on hearing that she was to go, "listened with a tightening of the heart," but Amy, finding that Lord Alan at once proposed to go yachting on the south coast, "exulted in such a proof of the futility of the machinations which had been devised to estrange her from her noble lover." He now appears, but he appears no longer as the noble lover, but as the wicked nobleman with whom heroines are only too familiar. He has "a shade of haughtiness in his tone." He carries off Amy in his yacht. As they were embarking from the pier, "they were a mark for curious glances from the knot of idlers who were gathered there." A cat may look at a king, but not, it would seem, holiday folk at the heir to a marquise. "It was evident that Lord Alan observed

and resented the inquisition, and he waved off with a haughty air the officious help of those who wished to lend a hand in pushing off the boat." Perhaps, as he was a Scotchman, and a poor Scotchman, he may have thought that, if he accepted help, he would have to pay for it. The yacht is carried the same day into port, and the pair of lovers hasten up to London. They are pursued by Dennis, who compels the wicked nobleman, quite contrary to his intentions, to marry Amy that same day. How that is managed, as she was under age, and had not her mother's consent, is known only to his lordship's banker, to whom he went "to take the necessary steps for procuring a special licence." "I am to marry you," he said to his bride, with something like a sneer. "You and O'Brien have elected that it is so to be." He talks indeed so finely to his wife that she must have thought the atmosphere, so far as words are concerned, very like that to which she had been always used. Before long he goes mad, and behaves to her one night in such an extraordinary manner that "her maid could see that the pale gold colour of her hair had been streaked with silver by the mental agony of the last few hours."

Meanwhile all the good people of the story who were content with poverty, and whose simple tastes were satisfied with fine words, are rewarded by getting rich and by falling into love with each other. Even the mercenary Amy is forgiven in the end for having "elected" to marry a nobleman, and is rewarded by the hand of an honest farmer. "The conversation," we read in one part of the story, where a dinner party is described, "rippled away to other subjects." If conversation can ripple away, we do not see why writing should not ripple also. In that case we would express a wish that the present silly fashion of novel-writing would ripple away till it soon ended, not in other subjects, but in a perfect calm.

GERMAN LITERATURE.

THE great work in which Herr W. Corssen* essays the final solution of the riddle of the origin of the Etruscans will, if the author's conclusions are established, close one of the most remarkable chapters in the history of philological and ethnological research. It will in that case be impossible henceforth to regard this mysterious people as aught but a branch of the Latin race, nor will the grievous loss to the imaginative faculty be compensated either by anything striking in the manner of the discovery itself or brilliant in the contributions accruing to our actual stock of knowledge. Herr Corssen's results are the conquests of patience and sagacity rather than of genius; in working out his theory he has but corroborated the conclusions of a long line of ingenious predecessors. Nor will the most accurate interpretations of inscriptions restricted to a few words, for the most part proper names, promote the reconstruction of an extinct civilization or afford the key to a buried literature. Corssen offers the imagination no equivalent for what he takes away, and hence his views will only be accepted with difficulty and reluctance. The most hostile, however, must acknowledge that his speculations, even if erroneous, are not fantastic or visionary. One need not be an Etruscan scholar to recognize not merely the caution and sobriety of the man, but the coherence and consecutiveness of the system. The more we read the more deeply we are impressed with the author's erudition, and still more with his easy control over what so many would have found an unmanageable mass of material. The impression goes on deepening until we are ready to credit anything rather than that one so temperate, so thorough, so painstaking, so completely the antipodes of all that is flighty or fantastic in philology, should have persuaded himself into the advocacy of an utter delusion. We can only offer the merest outline of an argument addressed to the most select of critical tribunals. The investigator commences with the study of the Etruscan alphabet, and directs his reasoning to establish its affinity to the other Italian alphabets, and the common derivation of all from the Phœnician. He next addresses himself to the inscriptions, and in the first instance to such as, the transliteration once ascertained, cast some light on the structure of the language, whether from being accompanied by a Latin version, or from containing the names of deities or heroes whose Greek or Roman equivalents are known. He then discusses the inscriptions which afford no such clue, and, endeavouring to elucidate their meaning on the hypothesis of their Italian affinities, is led to bestow a most laborious and minute investigation on their grammatical forms, nominal, pronominal, and verbal. To follow his argument will require such a knowledge of the more archaic forms of Italian speech as is probably possessed by few scholars beside himself. Of the suffrage of the initiated he seems assured; the uninitiated perhaps will long continue to entertain scruples, and, while admiring, to distrust the ingenuity which contrives to discover Latin affinities for words at first sight so utterly alien to all familiar speech. The instinctive conclusion that the peculiar civilization of the Etruscans cannot have been Italian, that it must have been exotic, and may have been Oriental, is one which it will take philology long to dispel. Herr Corssen is not expected to take cognizance of any considerations external to the sphere of philology, but even in strictly linguistic investigations it is not safe to disdain the suggestions of unsophisticated common sense. He will find it difficult to repel Mr. Taylor's recent home-thrust by convincing any one of plain un-

* *Ueber die Sprache der Etrusker.* Von W. Corssen. Bd. 1. Leipzig: Teubner. London: Asher & Co.

derstanding that when a particular word is followed by a numeral, it indeed means "aged," but that when its meaning is not thus ascertained beyond doubt, it must be understood as "the name of a sculptor." *Non sic iter ad astra*. The unriddlers of Egyptian and Assyrian mysteries have needed to resort to no such transparent subterfuges. How far this flaw may vitiate Professor Corssen's entire argument we cannot here attempt to determine. It will further be felt that the physical aspect of the question is most important, and that a satisfactory explanation of the abnormal but lifelike physiognomies of the Etruscan pair depicted on the sarcophagus in the British Museum must be an indispensable complement to the evidence derived from philology. A considerable step would be made if, instead of assuming with Niebuhr and Corssen that the Etruscans entered Italy from the North, we could discover grounds for relying on the ancient tradition which derives them from Asia Minor. In this case we should have an Asiatic people speaking a Pelasgic language, a conclusion in which the now seemingly discordant lines of testimony might happily unite. In addition to his main argument, Corssen's work contains most interesting chapters on the supposed dialects of Etruscan (Rhaetian, Etrurian, Campanian); the Greek words adopted into the language; and the locality and history of the principal archaeological discoveries hitherto made. Enormous as his volume appears, it is far from exhausting the subject. A second of equal dimensions is stated to be ready for the press.

The first volume of Professor Lefmann's translation of the *Lalit Vistara*, or Sanscrit life of Buddha, embraces only the first book. This is somewhat alarming, if, as we imagine, there are eleven more to come; and those who may resort to the work in the hope of learning something authentic about one of the greatest of philanthropists and reformers will experience much disappointment on discovering that this part contains nothing but the idle tales and fantastic imaginations of the Buddhist monks respecting Buddha's residence in the Tushita heaven before his miraculous conception, which are of no value except as evidence of the depth of the impression created by him. Better things may be expected to follow, and Professor Lefmann's notes, distinguished by great copiousness and erudition, no doubt constitute a valuable mine of information for the Buddhist specialist. He appears from his preface to have laid a good foundation for his labours by a greatly improved recension of the *Lalit Vistara*, the text of the Calcutta edition being, as he states, exceedingly defective. Siamese and Chinese versions of this Buddhist classic are respectively the bases of the valuable labours of Mr. Alabaster and Mr. Beal, which the English inquirer will for the present do well chiefly to consult. The perspicuity of these abridgments, contrasted with the unmanageable ponderousness of the original, is as good an instance as we know of the value of a good translation.

The second volume of A. von Vivenot's edition of the diplomatic correspondence of the Austrian Government during the wars of the French Revolution comprises about four hundred documents, from April 1792 to March 1793. It is not inferior in interest to its predecessor, but seems no better calculated to promote the editor's object of rehabilitating the reputation of his country as affected by the events of this unfortunate period. All that can be said is that Austria does not appear to have been more selfish, treacherous, mistrustful, or inimical than her rival. Both States were terribly afraid of taking more than their share in the operations against the common enemy, and desperately jealous of Russia, whom they suspected, with good ground, of egging them on with a view of meanwhile helping herself to Poland. The volume concludes with the second partition of that unfortunate country; the hypocrisy of the proclamations and other official documents relating to it is almost more revolting than the iniquity of the act. Many of the papers here printed are extremely piquant as well as important; such as the Austrian memorandum on the advantages of exchanging the Low Countries (which she could not keep) for Bavaria; and the conference between the victorious *sans-culotte* and the beaten Prussian general, in which the present positions of the parties are completely reversed.

A great "find" of the correspondence of the poet Bürger † has occasioned the publication of four huge volumes of that ambiguous class which nobody thinks it worth while to buy, but which many will be glad of the opportunity of consulting. Bürger's own literary repute, though considerable, is hardly adequate to so very massive a monument; the illustrations of the literary history of the time are less numerous and important than we should have expected; and the intrinsic merits of the letters are not remarkable. The best are those from Biester, afterwards Royal Librarian at Berlin, a man apparently of such vivacity and enthusiasm that one marvels to find him an ally of the prosaic Nicolai. The epistles of Bürger's Mentor, Boie, also possess considerable interest as illustrative of the gradual progress of Bürger's poems from the first draught to maturity, and are attractive from the sterling character of the writer. Bürger's own disposition is depicted with considerable liveliness; he appears good-hearted, disinterested, genial, devoted to letters; but irregular, impulsive, unrefined in his habits, and

always in more or less of a scrape. The scandalous details of his third marriage should have been suppressed. Herr Strodtmann's excuse for reproducing them is a very lame one. The circle of his intimate friends comprises few distinguished names, and the literary movement of the time, active as it was, is now chiefly important in an historical point of view. Goethe is an exception of course, but his correspondence with Bürger is unimportant. There are nevertheless many interesting indications of the tendencies of the period. English literature was beginning to exercise a marked influence on Germany. Shakespeare is frequently mentioned with enthusiasm; he and Plato formed at one time Biester's whole library. The Percy Relics were widely known and even more influential; Bürger's ballads would never have been written without them; and they clearly deposited the seeds which subsequently ripened into the Romantic School. The veneration of the young men for Klopstock is quite touching. On the whole, this voluminous correspondence will well repay inspection, although its chief value may be as a substratum for the biography of Bürger which Herr Strodtmann announces as in preparation. The letters to Bürger are much more numerous than those from him, although many of the latter exist in rough draughts, and Herr Strodtmann's diligence has recovered others from the hands of autograph collectors. The great mass of the correspondence came at Bürger's death into the possession of a former biographer, who, terrified at its amount, left it totally unused, and it has only recently come to light after a series of adventures.

Professor Teichmüller's "Studies on the History of Ideas" * are a valuable contribution to the history of ancient philosophy. The plan of the work is that of an inquiry into the precise signification attached by the Greek philosophers to the expressions employed by them. Their conceptions of final causes, optimism, immortality, and similar problems are successively discussed, the object not being to test the value of their opinions, but to determine what they were. Aristotle and Plato claim by far the larger part of the volume, but there is an interesting chapter on the physical theories of Anaximenes.

The strictly logical form of Dr. Seydel's treatise on Ethics † renders it only intelligible to those versed in the study of formal logic. The author's earnestness and moderation are conspicuous even amid his technicalities, and the abstruseness of his treatise consists much less in his style than his method.

In treating psychology "from the empirical point of view," Dr. F. Brentano ‡ signifies his adherence in the main to the English school, and enters upon a course of investigation which Germany is beginning to recognize as more promising of results than that hitherto followed.

The eight mediæval itineraries of the Holy Land § published by the indefatigable Tobler range from the eighth to the fourteenth century. Most of them have been already published in Wright's *Travels in the Middle Ages* and similar collections. The pilgrimage of St. Willibald, who visited Palestine in the eighth century, is the most important on account of its antiquity, and the furthest removed from a mere catalogue of names and places.

The principal novelty in Dr. Jacob's dissertation on the import of Dante's three guides in the other world ||—Virgil, Beatrice, and St. Bernard—is an endeavour to bring the ascent to higher spheres depicted in the poem into connexion with the actual development of Dante himself.

The "pictures of German culture" ¶ exhibited by Herr Kriegk hardly place that culture in the most advantageous point of view, being chiefly derived from the criminal archives of Frankfurt. They relate accordingly to such picturesque but unedifying episodes as abductions, secret poisonings, mercenary baptisms of knavish Jews, and proofs of the general venality of Frankfurt Senators during the first half of the eighteenth century. One transaction is exceedingly amusing; it is the prosecution of a tradesman who had endeavoured to repair his shattered fortunes by promising to betray the city to the French, but who, having respect to the possibility of detection, drew up beforehand a paper to be produced in case of such an event, protesting that his purpose was by no means to abet the enemy, but to swindle him. Nearly all these narratives are worth preserving, and all are well told. The second half of the volume is devoted to a history of Goethe's legal career at Frankfurt, while he yet followed the profession of an advocate. The memorials and other documents drawn up by him in this capacity are still extant, and exhibit, in Herr Kriegk's opinion, unequivocal traces of his style. They are sufficiently dry notwithstanding, Goethe's good sense forbidding him to be poetical out of place. The editor considers, however, that they are distinguished by a certain breadth of view and disposition to recur to first principles, which may be accounted for either by Goethe's superiority to mere legal technicalities or by his ignorance of them.

Beethoven, Liszt, Wagner*, are notoriously Professor Nohl's *dii majores*, and the ceaseless glorification of them in his collected essays must be wearisome even to those who share his predilections to the full. It would have been judicious to intersperse something relating to composers of a lighter strain and more universal acceptance, the constantly aggressive attitude of a thoroughgoing champion of an unpopular or at least unacknowledged style being extremely unpropitious to the soothing influence generally reckoned among the most precious attributes of music. Dr. Nohl, however, always writes ably, and his review of a rival biographer's, Thayer's, Life of Beethoven, is especially valuable from his intimate knowledge of the subject.

"Old England and Shakspeare"† is the first volume of a comprehensive work on Shakspeare by a highly accomplished man—clear-headed, sensible, easy and fluent in diction, and exceedingly well informed on all subjects relating to mediæval and Tudor England. The first half of the book is occupied with an historical introduction to the study of Shakspeare, treating of the national development up to Elizabeth's time, the characteristics of that age of exuberant vigour, the previous history of the English language and literature, and the dramatic precursors of Shakspeare. The second book contains an inquiry into the circumstances of Shakspeare's education and the characteristics of his style; an endeavour to delineate his moral and intellectual character; an account of his epic poems and sonnets; and a criticism on the especially dramatic side of his genius. The separate examination of his plays is reserved for another volume. In general, the author appears as a mediator between the English and German schools of criticism; the former he thinks deserving more credit than they have received from the latter, whose admiration, if not to be called excessive, is at least too indiscriminate and unchastened. In discussing the Sonnets he adopts the view of their being addressed to a plurality of persons, and lays no stress upon the expression "only begetter" in the publisher's dedication.

Friedrich Spielhagen's‡ collection of odds and ends will do no discredit to his reputation, although the pieces are for the most part exceedingly slight. They are principally sketches of travel, although a little story turning upon an application for a situation is the most entertaining thing in the book.

Two novelettes by Robert Waldmüller§ deserve unusual praise. The scene of one, a perfect little comedy in a narrative form, is laid in Normandy; the other depletes the life of a rustic community about the middle of last century with spirit and feeling.

Though not strictly a German book, Mr. Campbell's *Annales de la Typographie Néerlandaise*|| deserves a word of notice from its relation to a cognate literature. Mr. Campbell has inspected and minutely described nearly two thousand productions of the Dutch press in the fifteenth century, half of which are in his own keeping in the Royal Library at the Hague. Many of these are tracts or fly-sheets of the greatest rarity, and not unfrequently of the utmost literary or historical interest. The intellectual activity of Holland at so early a period is exceedingly remarkable, and Mr. Campbell's labours are of the highest importance as a contribution to bibliography.

THE SCOTTISH CORPORATION.

President.
H.R.H. the PRINCE of WALES, Duke of ROTHESAY, K.G., &c.

Local-Præsidents.
His Grace the Duke of ROXBURGHE, K.T.
His Grace the Duke of BUCCLEUCH, K.G.
His Grace the Duke of RICHMOND and LENNOX, K.G.
His Grace the Duke of MONTROSE, K.T.
The Right Hon. the Earl of LAUDERDALE, K.C.B.
The Right Hon. the Earl of ROSEBURY.

Treasurer.—Sir JOHN HERON MAXWELL, Bart.

The TWO HUNDRED AND TENTH ANNIVERSARY FESTIVAL of this Corporation will take place at the Freemasons' Tavern on St. Andrew's Day, Monday, November 20, when the Most Hon. the Marquis of LUNELLY, the Premier Marquis of Scotland, will occupy the Chair.

Subscriptions and Donations from Noblemen and Gentlemen who may not find it convenient to attend the Festival will be gratefully acknowledged and announced on St. Andrew's Day. In order to secure places at the Dinner tables, applications for Tickets ought to be made to the Managing Stewards at the Hall.

The Scottish Corporation Hall, E.C., November 19, 1874.

MACRAE MOIR.

PROFESSOR T. HEWITT KEYS' COURSE on COMPARATIVE GRAMMAR, at University College, will commence on Thursday next, November 26, at three o'clock, with a Lecture on Decapitated Words, which will be open to the Public.

MALVERN COLLEGE.

This College contains two Departments—the CLASSICAL and the MODERN. There is also a preparatory LOWER SCHOOL.

There are Boarding-Houses within the College Grounds, held by the Head-Master and others of his Staff; a Gymnasium, &c.

Board and Tuition under Fourteen, £80; over Fourteen, £90. Non-Shareholders pay an extra Fee of £5. Special advantages for Sons of Clergymen and Home Boarders.

For further information apply to the Rev. ARTHUR FAIR, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

The Examination for Scholarships and Exhibitions on December 22 and 23.

MALVERN COLLEGE.

The ANNUAL EXAMINATION for SCHOLARSHIPS and EXHIBITIONS will be held on December 22 and 23. There will be awarded Six House Scholarships of £50, Four Founders' Scholarships of £50, and some Exhibitions of £30. The Awards will be for one, or for two years, according to merit, in Classics or Mathematics. For particulars apply to the HEAD-MASTER.

SCHOLARSHIPS.—An ELECTION to FOUR ENTRANCE SCHOLARSHIPS, Two of £50 a year, One of £30, and One of £20, will be held on Wednesday, April 21, 1875.—Apply to the HURMAR, Hatfield College, Abingdon.

S. PETER'S SCHOOL, YORK.—Two Foundation SCHOLARSHIPS and Two Free Scholarships are awarded annually at the Midsummer Examination. Foundation Scholarships entitle the Scholars to Free Board in the Head-Master's house, and Free Education. Free Scholarships to Free Education only.—For full particulars apply to the Rev. the HEAD-MASTER.

ABINGDON SCHOOL (Six miles from Oxford).—An Old Foundation, with University Scholarships, having new Buildings and extensive Grounds. There are Classical and Modern sides, and a Public School training is given on modern terms.—For particulars, and admission in January, apply to Rev. E. SUMMERS, Head-Master.

A LADY and DAUGHTER wish to receive a YOUNG LADY requiring a HOME and Chaperonage. Cheerful society and domestic comfort ensured. References exchanged.—Address, H. Brown's Library, Kensington Park Road, W.

TRENT COLLEGE.—A GRADUATE of CAMBRIDGE or OXFORD will be required in January, as ASSISTANT MASTER in the Upper School. There are four University men on the staff, very little house duty, good cricket and football games, in which the Masters take part. Salary to commence at £50, with Board and Lodging and Two Comfortable Rooms.—References and Copies of Testimonials to be sent before December 15, to Rev. T. F. FARR, M.A., Trent College, Nottingham.

PRIVATE TUTOR or ASSISTANT-MASTER in a PUBLIC SCHOOL.—An OXFORD GRADUATE is DISENGAGED. Seven years' experience. Very high testimonials.—Address, F. N. A., care of Messrs. Robertson, 20 Long Acre, W.C.

WANTED, a HEAD-MISTRESS for the **NORWICH HIGH SCHOOL** for GIRLS, of the Girls' Public Day School Company, Limited. Salary £250 a year, with Gratification Fee. Apply, with copies of Testimonials, before December 14, to the SECRETARY, 113 Brompton Road, S.W.

CHISHLEHURST COMMON, Kent.—To be **SOLD** or **LET**. Rent £200, a newly-erected GIGG VILLA, of handsome elevation, situated near Chislehurst Church and Camden Park. Seven Bedrooms, Bath-room, three Reception-rooms, Offices, and Gardens. Water and Gas laid on. The position of Chislehurst Common is well known, and is probably the most perfect round London, combining as it does splendid air, gravel soil, good surroundings, and close proximity to the Metropolis, being within half-an-hour by rail of Cannon Street or Charing Cross Stations; it may fairly be said to include the advantages of both Town and Country. Messrs. DREXHAM, TEWSON, & FARMER, Auctioneers, 40 Cheap-side, E.C.

HYDROPATHY.—**SUDBROOK PARK, Richmond Hill.**
Physician—Dr. EDWARD TANE, M.A., M.D., Edin.
For Invalids and those requiring rest and change. Turkish Baths on the premises.

OVERLAND ROUTE and SUEZ CANAL.—Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, via the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday. Offices, 123 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.
ROBERT PARK, Manager.

AGREEABLE WINTER RESIDENCE.—**ILFRACOMBE HOTEL.**—High and Equable Temperature. Moderate Charges "en Pension." Through Trains direct from Waterloo.

WINTER at the GRANVILLE.—Replete with Home comfort. Hydrotherapy, Turkish, Ozone, Saline, Plunge, and Medical Baths. Billiard and Concert Rooms. American Bowling Alley. Spectacular Views, Sea and Shipping. Table-d'hôte 6.30 P.M.—Address, THE MANAGER, St. Lawrence-on-Sea, Ramsgate.

COLLECTIONS OF PHOTOGRAPHS. Completed, Collated, carefully Re-mounted, Titled, and properly Bound, to open quite flat, and interleaved with Paper for Notes of Journey. Indexes made for reference.

PHOTOGRAPHS of the BIG TREES, &c., in the YO-SEMITÉ VALLEY.

Large size. Splendid Pictures for Framing.

LORD GREY ON THE GOVERNMENT OF LONDON.

LORD GREY'S criticisms of the Bill for establishing a London Municipality are more forcible than his suggestions for the improvement of the scheme. Although he candidly admits that he is unable to suggest any alternative for Lord ELCHO's objectionable Bill, he hesitates in drawing the inference that an object which cannot be attained by sound and prudent legislation may perhaps not be in itself absolutely desirable. It is true that Lord GREY arrives at the conclusion that the question of metropolitan incorporation is not yet ripe for legislation; but he also concurs with Mr. BEAL and Lord ELCHO as to the urgent need of efficient municipal government for the metropolis. An efficient governing body must be strong, and until there is security against the abuse of great powers, the experiment of any constitution which can be devised is more or less hazardous. Lord GREY proposes to entrust the task of framing a municipal constitution to a Committee of Privy Council composed partly of Ministers and partly of men outside the Government. As he justly adds, the official members "would have no difficulty in "practically determining what the Report should be"; or, in other words, their colleagues would merely have an ostensible or consultative voice in the deliberations of the Committee. "The Report, with the evidence on which "it was founded, would thus become an authentic expression of the policy of the Government." In such matters evidence merely consists of the opinions of a certain number of people who profess to have studied the subject; and there would be little advantage in publishing in a Blue-book the substance of a dozen speeches and pamphlets which Mr. BEAL and his associates have already delivered. The most convenient and most authentic form in which a Government can expound its opinions is a statement by the Minister of the proper department in his place in Parliament. If the Cabinet is to control the decision of the Committee, it may as well undertake the responsibility in the first instance. The appointment of a Committee, or the introduction of a Bill, would prove that the Government had already determined the principal and most questionable issue. The opponents of Mr. BEAL deny in the first place that it is expedient to place four millions of Londoners under a single local Government; and the mode in which a municipality should be organized is of secondary importance. If unity of administration were necessary, perhaps the best course which could be adopted would be to make the management of the metropolis the duty of the general Government; but it is not worth while to discuss a scheme which will never be seriously proposed.

Lord GREY has on former occasions frequently expressed the dissatisfaction with which he regards the operation of the Municipal Reform Act. He now says, after mentioning the New York frauds, that there is too much reason to fear that great jobs have been perpetrated by our own Town Councils. The expression of vague suspicions is generally unjust, and it is but fair to state that Lord GREY's hypothetical charges are not supported by evidence. It is of course possible that corporate appointments may be given without due regard to merit, and even that local measures may be affected by personal interests; but the fault of the Corporation of New York was not occasional defection from perfect purity of acts and motives, but gross embezzlement and pecuniary fraud practised on a colossal scale. TWISS and his accomplices plundered the community of hundreds of thousands of pounds by fraudulent arrange-

ments with contractors for public works. There is no pretence for imputing any crime of the same nature to the members of any English Corporation. On the whole, the Municipal Reform Act has worked fairly well, through the fortunate tendency of elected representatives to become in some degree independent of their constituents. In some cases the poorer ratepayers have opposed sanitary measures, but even in this respect the Corporations have done more than would have been effected without their agency. The failure of popular government is likely to be far more flagrant in villages and in rural districts than in large towns, where there is generally some kind of public opinion. If sanitary theories had prevailed fifty years ago, when the only rural authorities were the justices of the peace, the Acts which are now likely to remain inoperative would have been enforced throughout the country with the smallest possible regard to the obstructive prejudices of the ratepayers. Not one country parish in a hundred will ever pay for improvement, except under pressure from the landlord, whose own interest is not unfrequently opposed to expense incurred for the benefit of his tenants. In Glasgow, Manchester, and other great towns, the Corporations have exhibited an enlightened liberality for which Lord GREY fails to give them due credit. When he classes Corporations with Boards of Guardians, and imputes to both kinds of bodies a combination of corrupt habits with undue parsimony, he shows but an imperfect acquaintance with municipal government.

The main objection to a Metropolitan Government is that London is too large, and that it has no civic unity. In provincial towns certain persons are known to all their townsmen as principal inhabitants. The speech, trade or industry of the place supplies a common public interest to the great bulk of the population; and, although the municipal body is often composed in part of members of lower rank, some of the local magnates are generally included in its number. In London there are no principal inhabitants; for the residents of the higher ranks are utterly unknown to their neighbours, with whom they have no common interest, except in the amount of the rates. Inferior agitators would make it their business to cultivate the favour of the democracy, which is, through its representatives, to raise and to expend a revenue of millions. The Municipal Council would be a little Parliament without leaders known beyond its own limits, without a responsible Ministry to conduct its business, and without control through the publicity which the newspapers give to Parliamentary proceedings. It is at least possible that the corrupt practices of New York might hereafter be imitated by such a body, though on a reduced scale. It is more probable that, as in New York, the proper duties of a municipality would be neglected, while the members were engaged in more exciting or more profitable operations than providing for the repairs of the streets. It is happily almost impossible that Parliament should assent to the monstrous proposal of giving the control of the police force, which is in itself an army, to the business of the male and female ratepayers. It is perfectly natural that, as a political ally of Mr. OGDEN and Mr. ARCH, Mr. BEAL should claim for the populace the appointment of judges and the management of the police; but Lord ELCHO may justly be charged with a certain levity in undertaking the conduct of a Bill which includes provisions so outrageously absurd. If the question is asked why a new Municipal Government is required, Lord GREY would perhaps have some difficulty in supplying an answer.

London is, notwithstanding the absence of a central governing body, at least as well governed as any large city in the world. Mr. COLE's theory that a powerful Corporation would enjoy facilities for confiscating the property of the Gas and Water Companies would scarcely approve itself to Lord GREY's judgment.

Lord GREY agrees with Mr. BEAL that it would be desirable to maintain as far as possible the existing municipal organization of the City. Mr. BEAL perhaps understands better than his critic the fallacy which is involved in any scheme for extending the area of City jurisdiction. The existing Corporation is respectable, efficient, and safe, because it is a powerful body administering large funds, and inheriting ancient traditions. The whole income of the Corporation belongs to the citizens, who, as they are often reminded by their adversaries, form but a part of the whole population of London. Mr. BEAL, on one side, and the citizens on the other, know, what Lord GREY forgets, that extension of area means the admission of the rest of London to partnership in the property which now belongs exclusively to the City. The Lord Mayor must, under the scheme which is common to Mr. BEAL and Lord GREY, be elected directly or indirectly by the ratepayers of the whole metropolis, and it is probable that future incumbents of the office would be more troublesome and much less respectable than their predecessors. Lord GREY's proposal that the Aldermen of London should, as in the City, be elected for life, might perhaps provide a slight corrective of the evils of popular suffrage; but the City Aldermen spring for the most part from the Common Council, and both bodies act harmoniously together. Aldermen holding their seats for life would inevitably be brought into collision with the Town Council, which would be annually elected; and, according to the experience of the colonies, a Council of higher qualifications and less popular origin or character is invariably worsted in conflicts with a democratic assembly. In one respect Lord GREY is more openly revolutionary than Mr. BEAL himself, inasmuch as he proposes to deal in some undefined manner with the City Companies, "which hold so much property, and of which the connexion with the City is somewhat obscure." It is well that the Companies should have warning of the dangers to which their property is exposed by municipal projectors. They may be well assured that they and their estates have not escaped the vigilant observation of reformers less candid and more thoroughgoing than Lord GREY. When the property of the City is once transferred to the metropolis, the Goldsmiths and Fishmongers and Skinners and the rest will certainly share the fate of the Corporation. Lord GREY is right in thinking that the Bill is a bad Bill; but it cannot be said that the adoption of his suggestions would make it materially better. It is satisfactory to find that Mr. CROSS is aware of the difficulties of an enterprise of which Lord BECHO flippanantly remarked that it was universally approved by the Press, with one solitary exception.

GERMANY.

EUROPE at present offers to the contemplation of the political observer, not only specimens of every form of government, but specimens of every degree of strength in government. The last news from Spain is that Marshal SERRANO is going in a month to the frontier to expedite operations. This is government in its weakest possible form—in its jelly-fish stage; just cohering, and that is all. Far higher in the ascending scale of strength is Italy, where there is a division of opinion as to how far strong government should be carried, but where even forcible measures are advocated or opposed in the ordinary manner prevailing in free countries. Italy is struggling against priests, and consolidating its national unity under many difficulties, but it has some of the advantages which accompany a position of secondary rank. It must, if attacked, fall back on some alliance, and cannot pretend to bear the brunt of the battle itself. The argument, therefore, that for the nation to exist at all the strength of the Government must be very great, does not apply to Italy as it does to Germany, which is like a huge camp, where no one wonders at seeing the provost marshal at every corner ready to string up marauders or deserters. The Government of Germany is as strong as a Government can be which acts according to known and legal

methods, and not from mere caprice. When a law is made intended to strengthen the Government, it is instantly carried out in the most resolute and uncompromising way. There is nothing of the *suaviter in modo* known to those who work the machinery of politics in Germany. In the opening of this year some new laws were passed by the German Parliament regulating the German press; and the German press is now being regulated almost out of existence. Every one concerned with the publication of political articles appreciates the personal peril to which he is exposed; and an article after it has passed the scrutiny of the editor, the publisher, the publisher's delegate, and the printer, is finally, before it appears, submitted, by excess of precaution, to a barrister, so that lively and easy writing must be difficult work at Berlin just at present; and one journal is said to have had fourteen communications from the Government lying in its office at the same time. Arrests in Germany are as common as sparrows in London. As Prince BISMARCK observed a few days ago when questioned about them in Parliament, it is the law that arrests may be made, and arrests are made. Diplomats are arrested in their houses, priests are arrested at the altar, social democrats are arrested at whatever places social democrats frequent. These people defy the law, going after their own foolish fancies and doing what they are silly enough to think right. They put, as Prince BISMARCK said in philosophical language, their subjective conscience above the objective law. Prince BISMARCK has not the slightest respect for their subjective conscience. They may have it on their side if it is any comfort to them, but he has the objective law on his; and as he is determined to show that his Government is a strong one, he uses all the machinery of strength which the law has placed at his disposal.

The Germans do not probably like all this, but they stand it. They have been brought up from the cradle to stand a very large amount of State interference; and to the German mind it does not perhaps seem anything extraordinary that grave officials should interfere in Alsace and German Lorraine when a baby is born, and ascertain on behalf of a sensitive Fatherland that the baby receives good honest German names, and begins life without the stain of anything French about him. It is the law that is being set in operation in every direction to guide and restrain Germans, and this is enough for them. They of all men best know the difference between the objective and the subjective, and they know that the law being objective hurts, and the conscience being subjective does not hurt very much. But they have a strong sense all the same of independence in their own fashion. Where the iron chains of law do not fetter them they delight in being free. In matters purely intellectual they are the apostles to Europe of free thought, and they are by no means ready to yield very submissively to authority when a law is merely proposed. It is not law as yet, and therefore they may take what line they please about it; and they enjoy this liberty of choice while it lasts. This turn of mind naturally makes a German Parliament somewhat difficult to deal with. It prevents the formation of a Ministerial party. Those who support the policy of the Ministry generally conceive themselves quite at liberty to oppose the Ministry on details. The officials, on the other hand, accustomed to the traditions and habits of strong government, receive acts of opposition as something like personal affronts. They have got their plan, and it is the right plan, the official plan, and ought not, they think, to be criticized by ignorant outsiders. A struggle ensues much more fierce than would have seemed probable in a country where authority is so very strong. It is found that, although there is no freedom of the press, and although persons of all classes and persuasions are being constantly arrested, the German Parliament is not in the least like the tame and well-drilled Legislative Body of the Second Empire. It accepts the general maxim that, with such an enemy as France on its borders, and such an enemy as Rome in its midst, it must make its Government very strong; and it recognizes that, whatever the law may be, the law is sure to be enforced in a very rough and serious way. But it debates with considerable freedom the measures which the Government submits to it, and when once it has taken a fancy into its head it is very hard to manage. If Prince BISMARCK steps forward and says that he, who knows the real dangers to which Germany is exposed, can honestly declare that an unwelcome measure must be passed, he

has hitherto had enough authority to win his point. But generally he does not intervene in this way. He allows the quarrel to go on to a certain length, sees how powerful and resolute the different parties to the quarrel really are, and then suggests some compromise, or makes some concession which settles the business.

The present Session of the German Parliament has only lasted a very short time, and the Government—that is, the authorities in the Federal Council who prepare the Bills—have already sustained two defeats. But such defeats in Germany mean something very different from Ministerial defeats with us. When Mr. GLADSTONE, for example, was beaten on the Irish University Bill, his defeat meant that he could not carry with him as many of his supporters as usually supported him. But when the German Government is defeated, it means that the majority of the Parliament does not like a Bill in the shape in which it is presented. The blow may come, and very often does come, from those who support the general policy of the Government; and those who, on this particular question, take the side of the Government may be those who, on questions of the first magnitude, are its most strenuous antagonists. One of the questions on which the Government has just been beaten is that of the Bank Bill. The Bill, as presented to the Parliament, embodied two main conceptions; one, that the banks in the several States having a right of issue should retain that right while no new banks having the privilege of issue were to be allowed; and the other, that issues of notes beyond a certain limit were to be subject to taxes. The MINISTER OF FINANCE was exceedingly proud of this last invention, which he said was a vast improvement on Sir ROBERT PEEL'S Act, and he prophesied that all Europe would sooner or later borrow this admirable invention. In ordinary times banks would never dream of issuing notes on which they had to pay five per cent. by way of tax; but in time of panic they could always avert a catastrophe and avoid the necessity of anything like our Suspension Acts, by issuing notes which, under such circumstances, it would pay them to issue. The German Parliament seemingly made no objection to the second half of his scheme, but it would not accept the first half in the shape in which it was offered, and insisted on having the institution of one central Imperial Bank made part of it. It was owing to the influence of Prussian officials that the Government had not proposed to establish such a bank. For the Prussian State Bank, although founded with private capital, is entirely controlled by the Prussian Government, and its high reputation and the care and skill with which it has been managed give it a position which throws all other banks in Germany into the shade. The majority in the Parliament insisted that the Prussian State Bank should be converted into an Imperial State Bank, on the ground that, in the interests of national unity, the credit and prestige of the first bank in Germany should attach to Germany and not to Prussia, and also on the ground that the immense power which the control of such a bank carries with it should reside in the hands of officials responsible to the EMPEROR and the German Parliament. The Government was thus placed in the light of being less devoted to German unity than it ought to have been; and accordingly, while it was supported by the arch enemies of Prince BISMARCK, by the Separatists and the Ultramontanes, it was opposed by the National Liberals, who are generally Prince BISMARCK'S fervent friends. It curiously illustrates the mode in which Parliamentary government is carried on in Germany to hear that Prince BISMARCK is generally supposed to have looked on the defeat of the Government with great satisfaction, and to have welcomed the support he derived from Parliament in combating the prejudices of his Prussian colleagues. The other question on which the German Government has received a check is that of the embodiment of the Landsturm. The Government wished to have the power of drafting as they pleased from the Landsturm into the Landwehr. The Parliament, it is said, will insist that such drafting shall only be legal when Germany is actually invaded, or when invasion is imminent. Perhaps in real life the Government will so manage that when it wants to fill up the Landwehr with drafts from the Landsturm, invasion will always be discovered to be imminent. But the Parliament has acted in regard to this Bill strictly within the limits which it has marked out for itself. It gives the Government most of what it wants, but not all. It makes it a little more difficult for those serving in the Landsturm to be sent far from their homes. In short, the

German Parliament is like the House of Commons in Committee, and the defeats of German Ministers are like the defeats of English Ministers in Committee. What the Government propose is substantially accepted, but as to the details there is great independence of action and opinion, and the Government has to see its measures greatly altered in order to get its Bills through. What is worth noticing is that independence of this kind should show itself so strongly in Germany concurrently with a humble submission to the painful operation of laws which have been once passed.

SHEFFIELD SPEECHES.

MR. MUNDELLA was at Bologna a few weeks ago, and had passed a happy and interesting day in visiting the little island in which OCTAVIUS, ANTONY, and LEPIDUS met to settle the destinies of Rome. On returning to his hotel, he took up his paper and looked at once for such English news as reporters thought it worth while to telegraph and journalists to insert. He found only one item of English news, but it was a most interesting one. It was to the effect that he and Mr. ROXBURGH were going to be asked to dine with the St. Peter's Club. He went through some little subsequent anxiety, as no letters arrived to confirm the delightful intelligence; and when he got back, he discovered that all that happened was that some one had talked of such a dinner, and thought that if such a dinner was held Mr. MUNDELLA ought to be asked. This circumstance suggested to Mr. MUNDELLA two reflections. First it made him think what enterprising people reporters are, how they seem to know facts by instinct, and constantly live in the shadow of coming or possible events. In the next place, it made him more alive than ever to the beauties and glories of modern life and modern civilization, to the ties that bind humanity together, and to the fellow-feeling that now pervades all noble souls. Here were the countrymen of AUGUSTUS and ANTONY, people who have mediæval history embodied in every line of their buildings, fortunate men who may any day see the St. Cecilia without any trouble, assumed by intelligent persons like reporters to be really interested in the fact that Mr. MUNDELLA was going some day or other to dine with a local Club. These are the little things that come home to the heart and make men reasonably proud of the period they live in. Probably, as Mr. MUNDELLA owned, the news did not give the Italians, for whose benefit it was telegraphed, any clear or correct idea of its meaning. They could not be expected to know what the St. Peter's Club was, but of course this made it all the more creditable to them to feel the interest they were assumed to feel in reading this dark little scrap of world-history. If the reporters continue to telegraph to Bologna about Mr. MUNDELLA and the St. Peter's Club, they can now explain what sort of an institution this Club is. The dinner has really come off at last, and Mr. MUNDELLA has really dined with the Club, and made a sort of inaugural speech, describing the objects with which the club has been started. We gather from his explanations that it is a most excellent institution, founded with a most laudable purpose. It is an institution founded to prevent the smaller tradesmen of Sheffield from getting drunk. We quite agree with Mr. MUNDELLA that one of the very best things that can be done for English society generally is to start clubs of this sort; and we may observe that it is precisely the very class of small tradesmen who generally lie out of the sphere of philanthropy, although they lead, of all classes perhaps, the most harassing and unadorned lives. There could not be a greater gain to a town like Sheffield than to have such a Club started, if it is well managed and prosperous; and its chances of ultimate success are not at all impaired by the hero of its inauguration having the courage to throw away the trappings and disguises of rhetoric, and to tell the members of the Club that the great gain they would enjoy now was, that they would have a place to meet at where a healthy public vigilance would prevail, and each man would be able to repress the joviality of his neighbour.

Mr. MUNDELLA has one fault to find with his constituents, and he blames them openly and boldly for it. They do not think enough of themselves. They do not boast enough of Sheffield. They are not sufficiently impressed with the momentous and elevating fact that Sheffield is "the sixth provincial town in the kingdom." Why is this?

Any one except their ardent and imaginative representative would be inclined to reply that the probable reason is that the people of Sheffield are not wholly dead to feelings of natural shame, and that they cannot quite forget the horrors and iniquities that were revealed when a recent inquiry was made into the local history of this sixth of our provincial towns. But this is by no means the account of the matter which Mr. MUNDELLA gives. He thinks that the real reason why the people of Sheffield have an unduly abject and langdog look is that they are depressed in spirit by the thought of Belgian girders. People who want girders, and might go to Sheffield for them, actually go to Belgium instead. But Mr. MUNDELLA is able to assure his constituents that they need not take the matter to heart so much as they are inclined to do. He has looked into the affair from a practical point of view, and has discovered that the orders for these girders are really of such a trumpery character that no decent Sheffield firm would care to execute them. They are a twopenny-halfpenny kind of girders which are beneath Sheffield makers. So Sheffield has no reason to be downhearted, and may set about boasting of itself with proper alacrity. And if it is objected that humble people cannot learn to boast all of a sudden, that they need encouragement and the stimulus of example, it happens most fortunately that Sheffield has just had a lesson given it by a perfect master in the art of blowing his own trumpet. Not only has the St. Peter's Club been "inaugurated" this week, but the Cutlers have held their annual feast, and there was present at the banquet, among other distinguished persons, the eminent representative of the United States, General SCHENCK. The General avowed when he rose to speak that he had come there to boast, and he did boast. He put it pretty considerably smart into the Britishers. He advised, rather than entreated, his hearers to cling to the United States with the warmth of a prudential and well-considered friendship. He was not for any palaver about kinship and a common language, and the joint inheritance of the glories of SHAKESPEARE and MILTON. He recommended England to love the United States because it could not really afford to quarrel with them. America does everything for us. It feeds us, it gives us an opening for one-sixth of our whole trade, it stimulates our activity by beating us in manufactures. If Englishmen want to know how dependent they are on the United States, and how much ahead the new is of the old country, General SCHENCK's simple advice to them is, "Go and see." Let Englishmen cross the herring-pond and look at the United States for themselves. There is to be in 1876 a grand flare-up in the States, in celebration of the centenary of their Independence, and if Englishmen pass over the Atlantic then, and take advantage of so unparalleled and splendid an opportunity, they will realize how completely they have been eclipsed, and will go home wiser and sadder men. Who can doubt that, so far as Sheffield at least goes, General SCHENCK is perfectly right? If Sheffield people go there in a docile spirit, and yet do not learn from their trip how to talk big and make the most of the sixth of our provincial towns, they are wholly incorrigible, and have souls destined permanently to succumb to the terrors of Belgian girders.

Mr. MUNDELLA and General SCHENCK might reasonably have hoped that they would not have spoken in vain, and that Sheffield might in a moderately short time be led to think and to swear that it could easily lick creation into fits, had it not been that, as a malignant chance would have it, there was some one else also present at the Cutlers' Feast. Our old friend TEAR'EM was a guest at the hospitable board, and that faithful watchdog was not going to see people setting themselves up and making much of themselves in his presence, and not have his bark at them. He was not at all inclined to boast, or to see things in too rosy a light; and he had something much more profound to disquiet him than the thought of Belgian girders. He saw a dark cloud looming over England, and this dark cloud was the preponderance in political power of the ignorant and foolish masses. He knows something about Sheffield, and does not regard the friends and neighbours of BROADHEAD as people quite so gentle and wise and intelligent as they appear to such enthusiastic lovers of humanity as Mr. MUNDELLA and the inhabitants of Bologna. To let the masses of our provincial towns really govern England would be fatal, and what is to be wished is that the silly many should be content to choose the wise few who are fit to rule them. There was much substantial truth in this, although Mr. ROEDUCK ought, in

justice to Sheffield, to have mentioned that it recognized the force of this important truth by returning him at the last election. But, in the way in which he put what he had to say, he was simply talking the language of philosophical Imperialists. Everything for the people and nothing by the people was the grand idea of the two NAPOLEONS, and to carry it out consistently is totally incompatible with the institutions of a free country like England. Too great a contempt for common people is as misleading to an English statesman as a factitious admiration of the virtues they do not possess. Small tradesmen have now got a vast share of political power; and it is much more useful to start humble institutions where they can learn to bully each other out of drunkenness than to treat them as hopeless idiots. In quiet times there are real opportunities of raising those to whom political power has been entrusted which it would be a national misfortune to see neglected. And certainly these are extraordinarily quiet times. The Conservatives of Gloucestershire have been holding a great gathering in the last few days, and the thoughts that seem to have taken the deepest hold of the minds of the excellent people who met in a spirit of harmless triumph was that they could scarcely be sufficiently thankful that Englishmen have at last got a Ministry which is thoroughly sound on the Turnpike question. A nation may be safely pronounced free from great anxieties which can find occasion for humble gratitude in the reflection that the views about turnpikes held by those who are charged with its destinies are wholly unexceptionable.

SPAIN.

THE late absence of news from the North of Spain is in some sense equivalent to an important event. To the numerous and distant spectators who at present watch Spanish affairs because the rest of the world is dull and tranquil, it may have seemed probable that, after raising the siege of Irun, the Madrid generals would take some measures for the purpose of improving their success. When it was found that the troops had returned to San Sebastian, where they have since waited for fine weather to re-embark, the inaction of LASERNA and LOMA was hastily attributed to causes which, although they may have possibly operated, are certainly not known to have really produced the result. It was said that the disloyalty of SERRANO and his Ministers was proved by a prohibition imposed on LOMA against pursuing the defeated Carlists or attempting to relieve Pampeluna; but no proof whatever has been given that LOMA's advance was checked by orders from Madrid. It was on the whole improbable that, even in Spain, the chief of a Government would deliberately prolong a civil war or invite defeat through undignified jealousy of successful lieutenants. Suspicious minds may still amuse themselves with imputations of treachery against the Government of Madrid, but the suspension of active movements admits of a more simple explanation. Large bodies of men require transport and provision, which seem not to abound at San Sebastian; and it is possible that LASERNA and LOMA may be as deficient in zealous activity as SERRANO himself. According to one theory, LASERNA is placed in command for the purpose of checking the inconvenient activity of LOMA; but the Commander-in-Chief seems to have displayed much energy in advancing to the relief of Irun; and if he is not eager to encounter unnecessary risk and hardship, there is no reason to suppose that his character differs widely from that of ordinary Spanish generals. It must be remembered that the season is in the climate of Biscay not favourable to military operations. The Carlist forces have in a friendly country better opportunities than their adversaries of procuring supplies and shelter. It will not be surprising if the winter months are allowed to pass without a serious renewal of hostilities, although the garrisons of the strong places which are wholly or partially blockaded by the Carlists must be exposed to danger through delay. It is improbable that any fresh attack will at present be made on the strong position of Estella.

According to reports which have hitherto been neither contradicted nor confirmed, the unacknowledged armistice is intended to facilitate negotiations with some of the chiefs of the insurgent provinces. It is said that Biscay and Guipuzcoa are in reality rather Republican than Royalist, though it must be confessed that they have hitherto successfully disguised their alleged inclinations. The writer

who states that messages have been exchanged between SERRANO and the Northern malcontents is convinced that the provinces care really only for their local privileges, and that they have accepted Don CARLOS as their champion merely because he proposed to abolish the centralizing legislation of former Spanish Governments. Some of the conditions of the proposed Convention are so far credible that a negotiation for a compromise on a similar basis was attempted in the Civil War of forty years ago. The provinces are said to claim exemption not only from conscription and from general taxation, but from the ordinary authority of the national Government. If SERRANO would consent to Home Rule in the North, he would undoubtedly be relieved from the task of restoring the unity of Spain. It is added that the Carlist officers claim the option of entering the regular army in their present ranks, and in such a treaty there would probably be secret articles inserted for the security and advantage of the principal negotiators. The story rests on respectable authority, and in Spain nothing is improbable. The last war ended with the betrayal by MAROTO of the Carlist cause; and perhaps an imitator of the deed might be found among his successors in the present day. On the other hand, negotiations for suspension of hostilities, or for peace, are among the most ordinary stratagems of war. It is not improbable that one party or both may for various reasons desire a respite of hostilities, and secret diplomatic communications would furnish an excuse for delay. The statement that the troops who surround CARLOS care little for his person or his pretensions is certainly exaggerated. Spanish testimony on such a point is worth little, but all Englishmen who have visited the Carlist provinces during the last year concur in the statement that the intrusive KING is regarded with a strong feeling of loyalty.

Even if the insurgents are really bent on an accommodation, it is impossible that SERRANO should even take into consideration their supposed demands. The Spanish nation is only resolved on one political question; but it has distinctly made up its mind to prevent its own disruption. After suppressing the revolt of the rebels and fanatics at Carthagea, the Government could not tolerate the independence of Biscay and Navarre. The federal tendencies which were often attributed to the Spaniards before the disastrous experiment of the Republic prevail only among a small minority. CASTELAR, who had spent his life in making fine speeches in favour of federalism, found, as soon as he took an active part in affairs, that his eloquence had never had any practical meaning, and that a country cannot at the same time be governed on a uniform system, and split up into independent provinces. It seems on the whole probable that the war will linger on until some vigorous Government or general applies the whole national resources to the suppression of the rebellion. The recent contest, tedious as it is, has not yet lasted two years, and, if it continues for two years more, it will not have equalled the duration of the former war. As the American Confederates learned by painful experience, time tells certainly, if slowly, in favour of the belligerent who can command the most numerous reinforcements. The best of the Carlist troops are probably equal or superior in discipline and efficiency to any part of the national army; but in some parts of the provinces nearly all the men of military age are already in the field, while the thousands of recruits whose enlistment is constantly reported by the Madrid journals represent, though their numbers may be overstated, an actual force which will at least make good the losses of the campaign. The established Government in Spain, as formerly in America, possesses absolute command of the sea, and holds all the considerable fortresses. The soldiers who have served during the war must have acquired some of the qualities of veterans; and the army is undoubtedly more efficient than when it emerged from the manipulation of the Republican Government. The slackness of the combatants on both sides, while it is conformable to Spanish traditions, may in some degree be explained by the comparative weakness of the Carlists, and by the confidence which the stronger party may reasonably entertain of ultimate success.

The best informed commentators on Spanish politics seem to think that the provisional state of affairs in Spain will probably be terminated by the restoration of the BOURBON dynasty. Queen ISABELLA herself appears to have no party in the country, although judicious and patriotic Spaniards may perhaps with good reason regret the violent

termination of her reign. Her son has the advantage of not being known to hold any particular opinion, nor indeed is he yet old enough to form a serious political judgment. His kinsman, Don CARLOS, whose hereditary title is as good as Don ALFONSO's, or better, has unluckily for himself become by accident or by choice the representative of clerical absolutism. Queen ISABELLA, though she was not less bigoted than the princes of the rival branch, had always been compelled to maintain the forms of constitutional government. After the expulsion of Queen ISABELLA, PRIM and his associates resolved to establish a new foreign dynasty, in the hope of effectually excluding the BOURBONS from a chance of return. If PRIM had lived, King AMADRO might perhaps have maintained himself on the throne; but when he fell, in consequence of, among other causes, the levity and bad feeling of SERRANO, it became finally impossible to select a foreigner as King. The House of BRAGANZA will assuredly never sacrifice itself to the chimerical project of an Iberian union; and the Duke of MONT-PENSIER, who is the only remaining Pretender of six years ago, has long since renounced, in favour of his wife's nephew, claims which he could in no contingency have successfully asserted. As the existing Government has no hold on the affections of the country, and as it is in itself an anomaly, the only alternative of a Monarchy under ALFONSO is apparently a Republic. The faction which supports the scheme can scarcely have become extinct in the course of a twelvemonth, though the Republicans have, through shame or prudence, maintained a judicious silence since General PAVIA at the beginning of the year did the country the service of turning their Cortes out of doors. When their agitation sooner or later revives, they may plausibly contend that SERRANO's Government has scarcely been more successful than their own; and if any humorist is to be found in their ranks, he might apologize for the Republican policy which disorganized the army by showing that a Spanish army is but rarely disposed to fight. As the destiny of States is not regulated by repartees, the prospects of the Republic are not at present hopeful.

DIFFICULTIES OF HOME RULE.

WHILE, but for Mr. GLADSTONE's pamphlet, political controversy in England would almost have died out for want of topics, it seems that the Home Rulers, whose existence had been temporarily forgotten, have been discussing among themselves internal differences of opinion which might perhaps have been more prudently suppressed or suspended. Agitators against existing institutions ought seldom to pledge themselves to definite or positive schemes, if only because they will certainly differ among themselves as soon as they undertake the task of construction. Mr. GLADSTONE was greatly blamed for affecting ignorance of the meaning of Home Rule, when he could not but know that in any form it involved the disruption of the United Kingdom. It was reasonably surmised that he felt a potential sympathy with a movement which no English Minister ought to encourage or tolerate. If he had plainly avowed a determination to maintain national unity, he might properly have exposed the inconsistency of various partisans of separation. Mr. P. J. SMYTH appears lately to have criticized an answer given by Mr. MITCHELL HENRY to one of the minor arguments against the repeal of the Union. During the Home Rule debate of last Session, Mr. MITCHELL HENRY contended that a federal arrangement might secure the continuance of free commercial intercourse between Great Britain and Ireland. In the remote contingency of a negotiation on the terms of dismemberment of the Empire, it is impossible to anticipate the stipulations to which Irish repealers might consent; but the menaces or the violence which had enforced the acceptance of their main demands would be available at any future time for the extortion of further concessions. An article in a federal Constitution which should provide for Free-trade between England and Ireland would only be retained as long as the Irish Parliament was averse to a policy of Protection. The priests and the demagogues who would divide between them the control of Irish policy would probably share the delusions which prevail among all the colonial democracies; and if they were hampered by a federal guarantee of Free-trade, they would rejoice in the opportunity of once more denouncing English tyranny and

selfishness. The repeal of the Union would furnish a sufficient precedent for the demand of complete legislative and commercial independence.

Mr. SMYTH, without committing himself to either of the conflicting systems of commercial legislation, insists that the question shall be left open to the decision of the future Irish Parliament. Whether Protection is mischievous or beneficial, a Parliament incapable of doing this or any other kind of mischief would, in Mr. SMYTH's opinion, be inferior to a colonial Parliament, and hardly worthy to be called a Parliament at all. It is not worth while to inquire whether the dignity of Ireland would be compromised by a restriction to which its representatives might have assented in framing the original instrument of federation. The States of the American Union have parted with the same portion of their sovereign rights, as well as with the prerogative of making peace and war, and of dealing with foreign Powers. Mr. SMYTH probably rejects Mr. BUTT's delusive scheme of federal union; and, if Ireland is to be an independent kingdom, its Government will be entitled to perpetrate any folly which has or has not been committed by other States. By the simple repeal of the Union Ireland would become a kingdom with a Parliament of its own, which must necessarily be soon afterwards reformed by the abolition of the House of Lords. Since the termination of the ill-omened eighteen years of Irish independence, the authority of the Crown in the United Kingdom has been virtually transferred to the nominees of a Parliamentary majority. If the Union were repealed, the Executive power in Ireland would be administered by the dominant party without reference to the wishes of the English Government. Mr. SMYTH is a more satisfactory opponent than Mr. BUTT, because he says what he means. If the Constitution supported by the Imperial power must be sacrificed to agitation, it is absurd to suppose that Irish disaffection would be mitigated by any federal compact. The probable disturbance of commercial relations between Great Britain and Ireland furnishes but a secondary reason for refusing to consider either Home Rule or Repeal; but as far as the interests of Free-trade deserve consideration, there is no doubt that Mr. SMYTH propounds the real point at issue. It has been found necessary to tolerate protective tariffs established by colonies which are practically independent, and when Ireland is as much exempt from Imperial control as New South Wales, English manufacturers will be taxed in Irish ports.

It is sometimes instructive to trace the absurd consequences which are deduced from comparatively plausible projects by candid and imprudent supporters. A certain Rev. THADDEUS O'MALLEY, who takes Mr. MITCHELL HENRY's part in the controversy with Mr. SMYTH, had previously devised a draft Constitution for the three kingdoms which may serve as a commentary on Mr. BUTT's plan of Home Rule. Mr. O'MALLEY, like other members of the party, proposes for the sake of symmetry to confer on Scotland the undesired boon of a Parliament of its own. With still more officious kindness, he undertakes fundamentally to alter the Constitution of England by depriving the Crown of the greater part of its prerogative and dignity. The Third Estate, as Mr. O'MALLEY, with characteristic knowledge of law and history, designates the reigning Sovereign, is no longer to be the QUEEN, but in each of the three kingdoms one of her sons. The PRINCE of WALES, the Duke of EDINBURGH, and the Duke of CONNAUGHT are to reign respectively in England, Scotland, and Ireland, except that the QUEEN is to be an Imperial or transcendental Third Estate over them for federal purposes. It is but fair to remark that the projector has an Estate at his disposal, because he had previously eliminated the Bishops from the House of Lords. Although Mr. O'MALLEY has not made himself acquainted with the rudiments of constitutional law in the United Kingdom, he seems to know something of the American system, from which he has borrowed the device of a Supreme Court. Even in the United States parties and Presidents have at last learned how to pack the Supreme Court with judges previously pledged to particular opinions. The reverence of an Irish Parliament for a Court which should declare that it had exceeded its functions may be readily appreciated. Imaginary Constitutions for Utopia are seldom interesting or useful; but if Home Rule were conceded, it would be necessary to invent articles of federation, and Mr. O'MALLEY's grotesque suggestions are scarcely a caricature of the schemes which might be seriously proposed. The best part of his draft of

an Act is a preamble which recites that the Irish demands have been granted because the Irish people "urge their claim with such force and on such solid grounds as it would be imprudent to disregard." If Mr. BUTT or his successors are ever able to use the argument of superior force, they may as well dictate the conditions of surrender.

As there is happily no immediate prospect of rebellion or civil war, the Irish members who profess the doctrine of Home Rule can only embarrass the Government by votes which are also for the present innocuous. The more sagacious of them have probably made up their minds to wait for a probable change in the balance of parties, which may once more give a price to their support. The veterans of the body can recollect the time when they were assiduously courted by Mr. DISRAELI, whose blandishments were ultimately wasted through the thoughtless impetuosity of his nominal chief, Lord DERBY. Mr. GLADSTONE still resents their desertion on his impracticable University Bill; and the belief that their conduct was then dictated by the Court of Rome affords the most intelligible explanation of his pamphlet on the Vatican. In case of need, neither of the great party leaders would perhaps despise a reinforcement of fifty or sixty votes, but the alliance of the advocates of separation is likely to damage any statesman whom they favour. With the exception of two or three unscrupulous democrats, all English and Scotch members are pledged to resist disruption, whether it is proposed as Home Rule or as simple Repeal. Mr. MITCHELL HENRY's contrivance for maintaining the right of buying and selling between England and Ireland is not less inadmissible than Mr. SMYTH's protest on behalf of the right of committing commercial suicide. The ingenious project of dethroning the QUEEN by the transfer of her powers to the PRINCE of WALES and the Duke of EDINBURGH is but an exaggeration of the anomaly which is involved in Mr. MITCHELL HENRY's proposal. Unless Ireland is to be absolutely separated from Great Britain, there must be some new federal Constitution which would clash with the fundamental rule that Parliament is omnipotent. At present a Customs duty might be imposed on English produce at Dublin or on Irish produce at Liverpool, if only the supreme authority of Parliament were employed for a perverse and retrograde object. A federal compact overruling the power of Parliament even in Great Britain would be an intolerable innovation. It is not inconvenient that Irish agitators should fall out among themselves in discussing the complex results which would follow from the application of Mr. BUTT's simple and loyal measure. The clerical projector who contributes a comic element to the discussion renders his adversaries the service of reducing his own principles to an absurdity.

THE MUNICIPAL ELECTIONS IN FRANCE.

THE presumed object of the French Government in fixing the municipal elections for the 22nd of November was to give the Conservatives the consoling spectacle of a string of local victories long enough to counterbalance the series of defeats which have been their portion in the Parliamentary elections. Nor did this object seem by any means beyond their reach. The Municipal Electoral Law of last Session had greatly reduced the numbers in the town constituencies, and, on the assumption on which the Conservatives have always acted in their efforts after disfranchisement, the excluded electors would all be Radicals. The mayors appointed by the Government had been long enough in office to make their wishes known and their powers felt. Under the double influence of disfranchisement and administrative pressure there was some hope that the result of the elections would give the Government increased confidence in meeting the Assembly. These anticipations have been rudely falsified. The returns that have come in from all parts of France show that, for any effect the Mayors' Law and the Municipal Electoral Law have had upon the mass of the constituencies, they might as well not have been passed. In all the towns of any size or importance, and in many of the rural communes, the Republican candidates have been elected, and the favourite practice has been to return the Mayor dismissed by the Government at the head of the poll. It seems clear from this that the power of the local officials as regards elections is very much less than it used to be. In spite of all that is said about the awe in which the ordinary French elector holds the humblest representative of the Government, these municipal

contests have shown that it is an awe which is apt to desert him at the critical moment. Whatever may be his dread of offending the Mayor in the abstract, he is not afraid of voting against him. It is difficult to determine to what this change is to be attributed. Something may perhaps be set down to greater secrecy of voting. The existing authorities may be more timid, if not more scrupulous, than the Imperial authorities, and may be afraid to take the measures for ascertaining how every elector voted which were freely resorted to before 1870. It may be suspected, however, that the principal cause of the change is the different estimate in which the Executive is held since the war with Germany. During the Empire the Government was to the peasantry and the *bourgeoisie* nothing short of a present god. It controlled all their actions, guided all their thoughts, and protected all their interests. Under the Septennate it still seeks to play the first two parts, but its capacity of playing the last part does not call forth the same confidence as formerly. The prestige of the Government as such has been terribly shaken. A power which cannot protect its subjects against invasion has not the same claim to their support as a power which, if it laid violent hands on their votes, at least took care that violent hands should not be laid on their persons or possessions.

The defeat of the Conservatives, however, is a less important feature of the municipal elections than the defeat of the Moderate Republicans. Republican candidates have been generally successful, but the Republicans returned belong in most cases to the extreme section of the party. When the Radicals have brought forward candidates of their own in opposition to those brought forward by the Left Centre, they have almost invariably carried them by large majorities, and the instances in which they have brought forward candidates of their own have been very many. The characteristic feature of the elections on Sunday is the success of the Radicals. It cannot be questioned that this is an unsatisfactory, and even an alarming, element in the situation. The defeat of the Left Centre candidates is calculated to do a threefold injury to the Republican cause. It will encourage the Conservatives in identifying the definitive establishment of the Republic with the definitive enthronization of Radicalism. It will alarm the more timid members of the Left Centre, and perhaps drive them back towards those vacillating counsels from which they seemed of late to have finally emancipated themselves. It will stimulate the Radicals to making fresh displays of their strength, and thus put new difficulties in the way of that alliance between them and the Left Centre on which the fate of the Republic depends. It looks as though the power of M. GAMBETTA in restraining his followers had at length been exhausted, and he were obliged to let them take their own line on pain of losing them altogether. It is true he may have made concessions to them in the matter of the municipal elections in return for counter-concessions promised on their part in the coming Session. But the performance of a contract of this kind must at best be uncertain. The Radicals may have the best intentions as regards their conduct in the Assembly, but when the moment for fulfilling them comes they may be led away by some gust of passion, and may overthrow in a moment the fabric which M. GAMBETTA has built up with so much expenditure of time and labour. The frame of mind which is likely to be induced by these victories in the municipal elections will make them especially liable to these sudden emotions. The salutary sense of their own weakness, which has done so much to promote prudence, will cease to weigh upon them, and they will be tempted to regard the Left Centre as a minority trading upon a supposed influence in the country which it does not really possess. All this is exceedingly unfortunate at a time when so much seems to depend on the maintenance of unity in the Republican camp. Supposing this secured, there is some reason to hope that the moderate politicians of the Right Centre may yet come to see the impossibility of successfully resisting the restoration of the Empire by any other expedient than the recognition of the Republic. But if, just as this conviction is beginning to take hold of them, the Radicals break away from the ties which have of late restrained them, and announce their determination to be satisfied with nothing short of a Republic after their own pattern, there will be no Republican alliance for the moderate members of the Right Centre to come over to.

And yet it is only fair to the Radicals to admit that at

least one excuse can be made for their conduct in the municipal elections. They have given up a great deal in conceding to the Left Centre the work of founding the Republic. It is a violation of all their original professions to admit that the existing Assembly is competent to set up any permanent Government, and one of the leaders in whom they used to place most confidence, M. LOUIS BLANC, has lately declared that his conviction of the Assembly's incompetence in this respect is still unshaken. The consideration for which the Radicals have, as a body, abandoned this position was the establishment of the Republic under circumstances in which they admitted they were themselves unable to ensure its acceptance, and this consideration the Left Centre undertook to provide. In doing this, the Left Centre probably reckoned without their host. They underrated the blindness of the Constitutional section of the Royalists, and consequently they were more sanguine than they had any right to be of uniting moderate politicians of all schools in support of a Conservative Republic. If this belief had been well founded, it is probable that the Radicals would have remained in the background; or that, if they had insisted from time to time on asserting themselves, no great harm would have come of it. Even as it is, their triumphs would have been exceedingly few if the Conservatives had voted for the Left Centre candidates. It is the abstention of the Conservatives that has given the victory to the Radicals. The end the Conservatives propose to themselves in letting the Radicals win will perhaps be attained, and the impossibility of founding the Republic will be demonstrated. It remains to be seen whether the Conservatives have consciously accepted the further result which is certain to follow upon this demonstration, and are prepared to become the obedient servants of NAPOLEON IV.

THE MONTREAL BURIAL CASE.

THE case of "BROWN v. Les Curé et Marguilliers de Notre Dame de Montréal," decided by the Judicial Committee on Saturday, is interesting as showing how impossible it is to keep spiritual matters wholly out of the control of the temporal courts. The Judicial Committee have been careful to go no further than they were actually forced to go into a domain so foreign to the instincts and training of lay judges. But, notwithstanding this, they have been obliged to ascertain the legal status of the Roman Catholic Church in Canada, to interpret the Rubrics relating to Roman Catholic burials, and to determine the extent to which Canadian Roman Catholics are bound by the decrees of the Council of Trent. Shortly stated, the case was as follows:—There is at Montreal a Literary and Scientific Society called the "Canadian Institute." In 1858 this Society was censured by the Roman Catholic Bishop of Montreal for retaining in its library books which were in the Roman Index. In 1865 certain members of the Institute, including one JOSEPH GUIBORD, appealed to Rome against this censure; and in 1869 the Bishop of Montreal published a pastoral, containing the answer of the Holy Office condemning the Institute on the ground that it taught pernicious doctrines, and also a decree of the Congregation of the Index forbidding Catholics to read or have in their possession the Annual Report of the Institute for the year 1868, and pointing out that members of the Institute would in future be denied the Sacraments, even *in articulo mortis*. The Institute thereupon held a meeting and passed Resolutions of submission, which, however, were rejected by the Bishop as insufficient and hypocritical in a letter received by the Administrator of the Diocese on November 17, 1869. This letter also explained that the charge of teaching pernicious doctrines referred especially to a Resolution of the Institute establishing the principle of religious toleration. JOSEPH GUIBORD died suddenly on the 18th of November, so that the contents of this letter were never made known to him, and two days later his widow applied for leave to bury him in the Roman Catholic cemetery. This cemetery is divided into two parts, separated from one another by a paling. In the larger part Roman Catholics are buried with the ceremonies of the Church; in the smaller part unbaptized infants and persons who have died without the Sacraments are buried without any funeral rites. Neither part is consecrated as a whole, but as the consecration of the grave forms part of the funeral ritual, each separate grave is consecrated in the one part,

but not in the other. The Curé of the church applied to the Administrator of the Diocese for instructions as to GUIBORD's funeral, and was told that, as a letter from the Bishop directing the refusal of absolution to members of the Institute even *in articulo mortis* had just been received, ecclesiastical burial could not be granted to GUIBORD. He could therefore be buried only in the smaller part of the cemetery, and without religious rites. The widow appealed to the civil courts for a *mandamus* to compel the Curé to bury her husband in the larger part of the cemetery. She was successful in the first instance, but the judgment ordering a writ of *mandamus* to issue was reversed by the Court of Revision, and this reversal was confirmed by the Court of Queen's Bench. Against this last decision the present appeal was brought.

The Judicial Committee had first to consider the status of the Roman Catholic Church in Canada. Before the cession of Quebec to England in 1762, the Roman Catholic Church was established in the province. There were regular Ecclesiastical Courts, and the Supreme Council of Canada exercised the jurisdiction recognized in French jurisprudence as the "Appel comme d'abus." After the cession of the Province, the Church continued to be recognized by the State. It retained its endowments, and the payment of the tithes due from its members to the clergy could be enforced by process of law. The Judicial Committee have not thought it needful to determine in what respects a Church subsisting under these conditions differs from an Established Church on the one hand, or from a voluntary Church on the other. "Even if," they say, "this Church were to be regarded merely as a private and voluntary religious Society, resting only upon a consensual basis, courts of justice are still bound, when due complaint is made that a member of the Society has been injured as to his rights in any matter of a mixed spiritual and temporal character, to inquire into the laws or rules of the tribunal or authority which has inflicted the alleged injury." The judgment turns, therefore, in the first instance on the question whether the denial of burial in the larger part of the cemetery is a matter of a mixed spiritual and temporal character. If the application of the widow had been for the performance of the usual religious rites, it is possible that the Court would not have so regarded it. But the Court held that, as the refusal of ecclesiastical burial—of burial, that is, with the usual religious ceremonies—involved the refusal of burial in the "ordinary place of sepulture," it was a matter of a mixed spiritual and temporal character. "It cannot be doubted on the evidence," they say, "that this qualification of the general right of interment . . . implies degradation, if not infamy." The Judicial Committee have not noticed in their judgment the reasoning of the counsel for the Curé and Churchwardens upon this part of the case. The contention of the latter was that burial in the smaller part of the cemetery implies only separation from the Church, not moral censure. This part is set aside, not for those who have lived evil lives as such, but for those who have died without the Sacraments. It is true that certain persons who have lived notoriously evil lives are buried in it, but such burial is an incident of the separation from the Church which is incurred by notorious wickedness. They are there not simply because they have been wicked, but because they have been wicked in a way which has led to their dying without the Sacraments. Nor is there any doubt that burial in the ordinary cemetery would be refused if demanded in cases in which the refusal could not possibly imply moral censure. If the Archbishop of CANTERBURY or Mr. GLADSTONE were to die in Montreal, and their relations were to ask to have them buried in the Roman Catholic cemetery, they could at most be buried in the smaller part. If, therefore, burial in the smaller part of the cemetery implies degradation, not to say infamy, it can only be because separation from the Roman Catholic Church implies degradation, not to say infamy. But this last view, it was argued, is only an opinion about spiritual things held by certain Roman Catholics, and an opinion about purely spiritual things cannot of itself give to these purely spiritual things a mixed spiritual and temporal character. The Judicial Committee, however, did not think it necessary to go into this argument, and decided that the question was one with which they could deal.

When the mixed spiritual and temporal character of the question at issue had been established, or more

accurately perhaps taken for granted, the next step was to ascertain whether the forfeiture of the right to ecclesiastical burial had been legally incurred by GUIBORD. It was not denied that it could be legally incurred, but only that at the time of his death it had been legally incurred by him. The law of the Roman Catholic community in Canada upon this point is contained in the Quebec Ritual, according to which ecclesiastical burial is to be refused to eight classes of persons. The only class under which it was possible for GUIBORD to be included was the class of "Pêcheurs publics qui seraient morts dans l'impénitence; tels sont les concubinaires, les filles ou femmes prostituées, les sorciers et les farceurs, usuriers, &c." It was probably foreseen by the respondents that, if the case went as far as this, the Judicial Committee would certainly hold that the *et cetera* under which it was sought to bring GUIBORD's case, would at most be held to include "offences ejusdem generis as those specified." He was neither a sorcerer nor a usurer, and the phrase sorcerers, usurers, &c., cannot on any fair construction of words be held to include persons who are members of literary Societies which have prohibited books in their library. In addition to this, a personal sentence seems to have been required in most cases by the ecclesiastical law of France to constitute a man a "pêcheur public," and though the Council of Trent pronounces all who read or possess prohibited books to be *ipso facto* excommunicate, and therefore, as was urged by the respondents, public sinners, the Judicial Committee held that neither the decrees of the Council of Trent nor those of the Congregation of the Index were ever received or recognized in France. It would have been necessary therefore to show—which was not done—that the Roman Catholics of Lower Canada had consented to be bound by these decrees since the cession of the province to Great Britain. The decision of the Court consequently was that the Curé and Churchwardens had failed to show that at the time of his death GUIBORD had incurred any ecclesiastical censure which would justify the refusal of ecclesiastical burial. Inasmuch, however, as ecclesiastical burial was not the thing asked by the widow, the judgment only orders the burial of GUIBORD in that part of the cemetery in which the remains of Roman Catholics who receive ecclesiastical burial are usually interred. It appears, however, from a remark of the appellant's counsel during the argument, that the Canadian Institute which now represents the widow will not be content without ecclesiastical burial; and that, if the religious ceremonies are omitted on the occasion of GUIBORD's funeral, it is prepared to bring an action for damages against the Curé. It is quite possible, therefore, that the case will again be heard of.

THE CRYSTAL PALACE.

MOST people will no doubt be sorry to hear that the affairs of the Crystal Palace are just now in rather a critical condition. Of course we do not mean to say that the Palace is a place of unequivocal enjoyment, or that it is popular with everybody. It is awkward to get at, and more difficult to get away from; on a great day there is too much squeezing, and on an ordinary day too much open desert; and at all times the weary lengths of hard flooring make the legs ache. Still, for all that, it is a place that we have all somehow got into the way of going to now and then, and it is wonderful how it has adapted itself to various social wants, and made itself necessary even for official ceremonies. There is, of course, no other country in the world where a King or Emperor who had arrived on a friendly visit would be handed over to a Joint Stock Company to be made a show of, on condition that he should be treated in return to a dinner and fireworks out of the profits of the exhibition. But then that happens to be our way, and if foreign potentates were not entertained by the Sydenham people, they would perhaps run some risk of not being entertained at all. A desponding shareholder suggested at the meeting the other day that it might soon be necessary to consider whether the Palace should not be pulled down, and the materials sold for what they would fetch; but it is to be hoped that this desperate contingency is still remote, if only for the sake of foreign princes. And, besides, there are the country cousins, the Foresters, the Bands of Hope, the Good Friday people, and the cats and canaries. It is evident that the Palace has many uses, and that it would be a public loss if it were by any chance to be closed. On the other hand,

however, the proprietors can hardly be expected to keep it up at a dead loss, and it certainly cannot be said to have fulfilled the lofty promises and glowing expectations with which it was originally projected. Some of the shareholders might perhaps be disposed to make a sacrifice of revenue for the sake of doing something to elevate and refine humanity; but as the Palace has almost from the first degenerated into an ordinary place of amusement, seeking to attract visitors by the usual vulgar means, it is not surprising that, in the absence of any moral satisfaction, a dividend should be keenly demanded. The Directors reply that they have done everything they could think of to make the place pay, but it was a bad bargain from the first; it requires constant patching and mending, and this runs away with the money.

There can be little doubt that the great, and probably fatal, mistake about the Crystal Palace is the immense size and peculiar construction of the building. Nothing could have been more appropriate for its original purpose than Sir JOSEPH PAXTON'S huge conservatory. What was then required was a very large building, with abundance of open well-lighted internal space, composed of light materials which could be quickly and inexpensively put up and taken down. There was no doubt at first a sort of romantic novelty in the edifice then constructed, but it was certainly not beautiful, and it was quite unfitted for permanent use. As it now stands, it disfigures by its huge, unmeaning bulk an exceedingly picturesque stretch of country, while its prominent situation exposes it to all the violence of the weather, and necessitates constant and ruinous repairs. There can be no question, indeed, that the whole Sydenham project was planned in a fit of vapoury enthusiasm, and without reference to practical conditions. Too much reliance was placed on the prestige of the Great Exhibition, and too much was attempted all at once. It was forgotten that the novelty of the experiment had been rubbed off, that a copy is never so attractive as the original, and that, in any case, Sydenham is rather out of the way compared with Hyde Park. The consequence has been that the enterprise has always been weighed down by the reckless and extravagant outlay to which it was committed at the outset, and which it has apparently never been able to shake off. The plain truth would seem to be that the Directors have got a place which is much too big and too costly ever to be made to pay. The mere current expenses of the building, the indispensable repairs, the cleaning, gardening, and so on, constitute a standing charge which leaves extremely little margin for profit. On special occasions, no doubt, there is a good harvest, but for the greater part of the year the Palace is, in vulgar language, simply eating its head off. The gale which blew down the North wing in 1861, and the fire which destroyed the Tropical end of the building five years later, were perhaps rather an advantage to the Company, and the question which it has now seriously to consider is whether it cannot further reduce the area of everyday expenditure. Another obviously weak point in the system of the Palace is the great variety of business which it is attempted to carry on at the same time. It is a great garden, a bazaar, a theatre, a concert-hall, a restaurant. Any one of these things, in order to be thoroughly well conducted, would require the close attention of a competent manager, and yet they are all included in the miscellaneous work of a single establishment. An effort is now being made to raise the character of the dramatic entertainments, and it is to be hoped that it may be successful. But it is impossible not to fear that the variety of functions which the Company assumes stands in the way of the success which would attend a more limited enterprise.

It is melancholy to compare the present condition of the Crystal Palace with its brilliant and imposing opening twenty years ago. The QUEEN and the PRINCE CONSORT, surrounded by Ministers and Mayors, took part in the ceremony; and the Archbishop of CANTERBURY attended officially to offer up a prayer for the success of the undertaking. This success, however, has not come in the shape of dividends, and the shareholders are naturally disappointed. If they had obtained credit for philanthropy and devotion to high art, that would have been always something, but they have not got even that. It is perhaps now forgotten that the Crystal Palace was originally established in order to "elevate and refine all classes of the community, to blend instruction with pleasure, to educate the eye and quicken and purify the taste, by the habit of regarding the beautiful," and generally to provide a high-class

substitute for "the debasing amusements of the town." It appears that the Palace now depends chiefly on the share of the profits derived from the sale of beer and sandwiches. But the descent of the Sydenham Exhibition from its original giddy elevation is not an isolated incident. It is remarkable that, although the Great Exhibition of 1851 was in itself undoubtedly a great success, a curious blight has smitten all the offshoots which sprang from it. The Exhibition of 1862 was not only a failure, but a scandal. The series of International Exhibitions which began in 1871 has just been brought to a miserable and ignominious end, and it is authoritatively announced that no repetition of the unhappy experiment is to be attempted. The Royal Albert Hall, which, like the Crystal Palace, started with the advantage of the prayers of the Archbishop of CANTERBURY, is reduced to fitful competition with the ordinary concert-rooms. The explanation of the apparent fatality which has attended these various enterprises is no doubt to be found in the sickly and artificial conditions under which they originated. Nobody perhaps had any serious faith in the sort of millennial aspirations with which the Exhibition of 1851 was associated, and in any case they were destined to be soon rudely dissipated. But they had been put forth under the sanction of great names, and it was thought that the patronage at least was a good marketable commodity, and might be traded on in other ways. The result has demonstrated the error of this calculation. If any lesson is to be learned from the general decline of the brood of speculations which had their origin in the first Exhibition, it is that the most distinguished patronage and the most grandiloquent pretensions will not secure the permanent success of any kind of public amusement which has not in its own merits a more substantial foundation for its popularity. In the end, Crystal Palaces and Royal Albert Halls have, notwithstanding the imposing agencies invoked on their behalf, to find their natural level; and if they fail to furnish as attractive or convenient an entertainment as is offered elsewhere, they have to bear the consequences.

THE ADVANTAGES OF PREJUDICE.

PEOPLE who hope to reform the world by attacking the vast masses of existing ignorance are apt to regard stupidity as the grand obstacle in the way of progress. If only, they think, people could be got to use their minds, instead of taking everything on trust, the world would be far more malleable. What now requires a century might then be easily done in a generation. If human beings were only raised universally through one degree in the scale of intelligence, the consequences would surpass calculation. Most men are capable of seeing the force of a simple syllogism whilst it is kept steadily before them. If they were capable of following a chain of argument composed of two such syllogisms, the whole face of the world would be changed. Unluckily we generally find that, whilst we are attempting to raise the superstructure, the foundation has disappeared, and we come to regard the ordinary mind as a sort of quicksand capable of engulfing any amount of good logic without showing the smallest traces of the process. Admitting the existence of an evil which is indeed palpable enough, it may be as well to look for a moment upon the bright side of things; and to consider some of the advantages which we owe to the wide diffusion of a good honest stupidity. It would of course be an improvement if the average brain were rendered uniformly stronger than it is; we should be one degree further from the apes; but much that we revere as stupidity, and that does in fact deserve the name, is a quality which is absolutely necessary for the welfare of society. To destroy it would be to destroy the chief element of stability, and therefore an essential condition of safe progressive development. Prejudice is an unreasoning adherence to opinions; we propose to remove it by making people more sensitive to the promptings of their logical faculty; but we overlook the fact that in many cases, possibly in the majority of cases, the logical faculty does not deserve to be trusted, and that a man is more likely to be right who holds on blindly to the opinions in which he was born, or to those which satisfy his dumb instincts, than one who changes his opinions in obedience to the promptings of "what he is pleased to call his intellect."

Suppose, for example, that people were generally so logical that they surrendered at discretion to every argument which they could not answer. It is difficult to form an adequate estimate of the utter instability which would result. Not long ago a distinguished gentleman of ripe years, and presumably far above the average in point of intellectual vigour, became a Roman Catholic at a moment's notice. The arguments which convinced him would be equally unanswerable to everybody at his stage of mental development. If all such persons were equally sensitive to logic, we might wake up one morning and find that half the population had become the obedient disciples of Dr. Manning. At a slightly different stage of intel-

lectual development the arguments of Mr. Bradlaugh might appear to be equally convincing, and another large part of the population would rush into the opposite extreme of absolute infidelity. The discovery of a slightly new mode of putting some old argument would throw the whole weight of opinion from one side to another at a moment's notice; and we should change our religious and political creeds as rapidly at least as ladies change their fashions. The good stolid adherence to opinions which prevents such sudden oscillations is generally stigmatized as prejudice, and is sometimes regarded as an unmixed evil. Yet, after all, it may be doubted whether it does not really indicate a more reasonable state of mind. A man who changes his creed at a moment's notice in obedience to some clever logical artifice may not be really more logical than the man who adheres to his prejudice in spite of logic. The prejudice which ballasts the ordinary mind is frequently what might more fairly be described as latent logic. It is a dumb recognition of the fact that the change of opinion which is forced upon him by an apparently unanswerable argument really involves a whole series of changes in his manner of contemplating the world, of which he cannot render an articulate account to himself, but which may nevertheless fairly influence his understanding. When any system of doctrine has really sunk into a man's mind and coloured all his habitual modes of thought, he cannot give it up because upon one particular point it may appear to be demonstrably erroneous. The thoroughly good reasoner who can grasp all the relations of the controversy would be able to draw out into a definite statement a whole series of arguments which a clever and versatile thinker disregards because he cannot state them definitely, and which the prejudiced man obeys, though he is unable to produce them. The man of prejudice will undoubtedly appear to be more stupid than his more easily converted friend; but the quality for which he is ridiculed may imply, not a deficient faculty for dialectics, but a greater sensibility to really logical considerations. The man who prides himself specially on his logic is generally a man who has a power of excluding from his mind all arguments which cannot be expressed in a neat set of syllogisms, and therefore, very often, the arguments which are of most importance to the forming a sound opinion.

We are apt, therefore, to look with considerable suspicion upon people whose favourite virtue is the rather ambiguous quality known as candour. The candid man is generally also the crotchety man. We have unfortunately no difficulty in recognizing the type of thinker who is always open to argument upon all points. There are a number of amiable and excellent persons who seem to go about the world picking up new crotchets and defending them all with equal ingenuity. They are so ingenious and fertile in demonstration that they are predestined to be the natural victims of every new impostor. At an earlier period of history they would have become notorious for the invention of new heresies, and would have gone to the stake with admirable heroism. As it is, they enjoy such a small imitation of martyrdom as can be made out of the ridicule of sensible people, and take to themselves infinite credit for not being influenced by a sense of humour. In one direction they become teetotallers or vegetarians. They prove by the most unimpeachable reasons that all the ills which flesh is heir to are caused by the publicans and the butchers. They gather together men likeminded with themselves, and present themselves to the unbelieving world upon platforms, with the sense that they are the sult of the earth. In political life they discover that all the evils of democracy and socialism may be fundamentally cured by altering the system of voting, and that the salvation of mankind depends upon the general adoption of their peculiar patent ballot-box. Other persons believe that social evils of all kinds will be eradicated as soon as we have generally adopted their new system of drainage. Such people are the great patrons of mediums. They resent the argument founded upon the general resemblance of their favourite charlatans to the other impostors who in all ages have practised upon the credulity of mankind. That is merely an expression of unreasoning prejudice. If you can produce a good tangible proof that on some definite occasion a table really jumped into the air or rapped out a message from the other world, they hold that, till you have exposed the particular trick, you are bound to hold your judgment in suspense. One is rather disposed to envy people whose opinions are in such a fluid state that they can all be fundamentally changed by the discovery of a single argument, and whose intellects are never encumbered by any solid mass of immovable conviction. It must be very pleasant to the imagination to feel that nothing is finally settled, and that some new turn of the kaleidoscope may present the universe in a totally new guise. It must give an interest to any course of inquiry when you can never be sure that it will not invert every recognized opinion, and enable you to bound from Ultramontanism to Atheism and back again at any new turn of the wheel. And yet, on the whole, when we have contemplated the performances of such intellectual acrobats, we cannot but value more highly the good old force of prejudice or stupidity which enables so many of us to keep our feet planted on the solid earth, and allows us to be perfectly content if in the course of our lives we have got one or two new opinions solidly wedged in amongst our old convictions.

A good deal has been said lately about the logic of feeling. Scientific people are never tired of warning us that we ought not to allow our wishes to determine our reason, and that the fact that a particular theory is pleasant is no reason for holding it to be true. We certainly do not mean to dispute this doctrine in the terms in which it is stated. We

are all a great deal too much inclined to shut our eyes to any line of argument which threatens to lead to uncomfortable conclusions. But there is a certain sphere within which this logic may be legitimately applied; and though in one sense the opinions to which it leads may be called unreasoning prejudices, they are often prejudices of a very healthy kind. We may, for example, know a man or a school of men to be humbugs without being able to draw out our reasons into definite mood and figure. It is not that we have not reasons which may be amply sufficient; but that they depend upon a number of observations and presumptions too fine to be translated into language. When we have to do with human beings in practical life, we have to distrust some and to put implicit confidence in others, though, if we were cross-examined in a court of justice, we should be entirely unable to give satisfactory grounds for our conclusions. If, because we were sensible of this inability, we were to refuse to take our instincts into account, we should very soon get into intolerable difficulties. The Johnsonian argument, "The man's a rogue, and there's an end on 't," is very often an extremely simple one, though it does not conform to any recognized logical formula. The same mode of reasoning is extremely useful in more speculative questions. A good many beliefs which go up and down in the world may be summarily set aside, because we have an instinctive perception that they are the beliefs of charlatans and dupes, without much risk of serious error. Here and there, of course, such opinions may be new truths which are slowly revealing themselves to mankind. If we trust to our prejudices, we must be content to be in some respects behind the most advanced thinkers; but we shall avoid falling into a great many small errors which are destined simply to increase the rubbish-heap of decayed nonsense which is always accumulating. And at any rate it is as well that the opposing force of dumb prejudice should be strong enough to impose a severe test upon new doctrines in the struggle for existence, so that those alone may survive which have some intrinsic vitality.

TUSCULUM.

A CITY which has twice been the rival of Rome has of itself no mean place in history. But that the history of the world should run in such cycles that Rome could, at two stages of her being, find a rival within sight of the Palatine—that the city whose borders had once been on the Euphrates and the Solway should come again to strive on equal terms with enemies on the Alban hills—this teaches us a more instructive lesson still. Rome was the victim of her own greatness. It was because Rome had first subdued, then incorporated, the whole civilized world—because all the Mediterranean lands had been merged in Rome and all their free inhabitants had become Romans—because, as Rome was everywhere, the sovereign of Rome was as much at home at York or at Antioch, at Byzantium or at Aachen, as he was on the Palatine or the Capitol—it was directly because of all this that a day came when Rome was again a single Latin city waging war with other Latin cities, nay more, a day when she stooped to receive her Bishops at the bidding of the lords of the city whose earlier lords had fought to restore her Tarquins. On the same range of hills, within sight of Rome, lay two cities by whose side Rome was young. Both were kindred cities; one, so legend said, was Rome's own metropolis. Both were swept from the earth in local warfare with Rome. But a long time indeed passed between the earlier and the later deed of destruction. One perished before trustworthy history begins; the other perished as it were yesterday, in the twelfth century of our era. Rome, in her infancy, deemed the ruin of Alba needful for her own safety. Then came a time in which the like plea called for the ruin of Corinth and Carthage and Jerusalem. Then came again a time when her enemies were once more at her gates, and Tusculum perished as Alba had perished eighteen hundred years before. And mark too that Rome's wrath was more abiding against the nearer victims. A day came when Roman Dictators and Emperors bade Corinth and Carthage and Jerusalem arise from their ruins. No such command went forth to Alba or to Tusculum. Tusculum is still a forsaken ruin on its hill-top; Alba has perished so utterly that scholars dispute about its site.

The site of Tusculum does not stand out in the general view of Latium as we might have expected either from the history of the city or from the real height and strength of the place when we reach it. The whole range of which it forms a part is overshadowed by the mighty peak of the Latin Jupiter, the temple where Marcellus triumphed, and whose remains were swept away by the fanatical barbarism of the last Stewart. But besides this, the Tusculan height does not stand out in any special way from the other heights on its own level. In the general view it forms part of the Alban range, and that is all. But a visit to the spot itself shows what Tusculum really was, and shows also why it was that Tusculum on its height was outstripped by its younger rival by the Tiber. The difference simply is that one was on the height and that the other was by the Tiber. Tusculum belongs to the oldest class of cities, to the days when defence was all in all, when the main object was to find a spot strong by nature and to make it yet stronger by art. It was a step, and a great step, in civilization when men came down from the heights and occupied sites by the rivers, sites in which defence was no longer all in all, but where commerce and general convenience were thought of also. The change from Tusculum to Rome is the change which Homer marks between Dardaniæ on Ida and holy Rhoë in the

plain. Tusculum on her mountain top might well be the head of Latium; but she could only be the head in the sense of dominion or pre-eminence. Perched on her own height, she could never incorporate the towns on the lower heights around her. They might be her enemies, her subjects, or her confederates; they could never become part of her own being. It was otherwise with the lower heights by the Tiber; there the process which in the end incorporated all the Mediterranean lands could begin with the incorporation of the Palatine and Capitoline hills into one city with a common Comitium. Tusculum might, in one state of things, be the head of a Latin confederacy; in another state of things it might be the seat of Counts powerful and dreaded by their neighbours. But it could never become the head of Italy; still less could it become the head of the Mediterranean world.

The true historic position of Tusculum is thus, if the phrase be not a bull, at least as much prehistoric as historic. To many minds the name would rather call up associations belonging to an intermediate date. As a favourite dwelling-place of Cicero, as having given its name to an important portion of his works, Tusculum suggests the thoughts of times widely different from those of either its earlier or its later rivalry with Rome. But this is what we may call an accidental interest. To have formed part of the Roman state is common to Tusculum with half Europe; to have been a favourite retiring-place of the great men of Rome is common to Tusculum with crowds of other spots in Italy. The distinctive history of the place lies in the earlier and the later times, and in the remarkable cycle by which the mediæval position of the place repeated its prehistoric position. On a visit to the spot itself, we see the traces of all periods, though the traces of the last of all are conspicuous only by their absence. There is the Tusculum of the Latin Dictators and the Tusculum of the Roman Consular. For the Tusculum of the Counts, the Tusculum which fought for Cæsar when Cæsar was Rome's enemy, we look in vain. The remains of the Latin and of the Roman city are there in abundance. Of the mediæval city there is not a vestige. But the very absence of such vestiges is of itself the most speaking of all witnesses to the mediæval history of the city. In the first days of Henry the Sixth Rome avenged on Tusculum the overthrow which the Roman arms had suffered at Tusculan hands in the days of his father. And the vengeance of Rome was thorough. There was no motive to root up the scanty traces of days gone by, of the citadel of Mamilius or of the villa of Cicero. But the Tusculum which Rome dreaded was utterly swept away. Of house, church, or castle, such as they must have stood in the twelfth century, not a sign is left. Mediæval Tusculum has vanished; in after days the insignificant Frascati lower down the hill arose as a poor substitute for the threatening rival of Rome.

The ascent to Tusculum really begins a long way off, on the road from Rome to Frascati; but it is at Frascati that the special climb to the ancient site begins. Frascati itself, in a Roman ruin which is pointed out as the tomb of Lucullus, gives a slight instalment of what is coming. As all roads lead to Rome, so many paths, from Frascati at least, lead to Rome's rival. A guide therefore is hardly needful, unless there are any in the company who shrink from the use of their own feet. Yet the guide's presence will throw some little light on an aspect of human nature which is always curious. The guide can hardly be persuaded that you do not want to stop and see some Villa Borghese or Buonaparte, or something of the kind—among the mushroom "princes" of Rome one is not always sure of one's particular tyrant's or Pope's nephew—he is a little surprised that you do want to stop and see the first monument of the old city to which you come, the amphitheatre, which he presently proclaims to be the School of Cicero. Yet the guide has his use; if asked, he does know the ancient remains, and he can show where some of them are which the traveller will have some difficulty in finding, if he has no better help than the utterly confused account in Murray's Handbook. The guide, in short, adapts himself to those whom he guides; he himself knows better than most of them; but, as most of them think more of a modern house and garden than of the remains of the ancient city, he assumes that the villa and not the amphitheatre is the point at which the traveller will wish to stop. He himself, perhaps discreetly for himself and his beasts, tarries at the highest level of the Roman remains, and leaves the traveller to climb the height of the oldest Tusculum for himself. For the existing ruins naturally fall into three parts, which the traveller must necessarily reach in an order which is the reverse of chronological. First in date, last to be reached, is the highest point of the hill, the *arx* or acropolis, the original primeval fortress from which Tusculum and its Dictators looked around on a crowd of other heights crowned by cities confederate or hostile, while the Rome of those days, when there was as yet no cupola on the Vatican, no lofty front on the Coelian, no soaring campanile on the Esquiline, faintly showed its rival towers in the distance. The *fastigium* of Jupiter on the Capitol may have dimly shown itself, as a distant and lowlier rival to the prouder Jupiter of the Alban Mount. We look over the lowlands of Latium to the sea that brought the civilization of the ancient world; we think perhaps of Mamilius and his vest of purple,

Woven in the land of sunrise
By Syria's dark-browed daughters,
And by the sails of Carthage brought
Far o'er the southern waters;

but we think, too, that the gifts of that sea were open to the city by the Tiber in a way in which they were not open to the city on the height; we remember that Tusculum could never have grappled with Carthage on her own element, or have reckoned the "land of sun-

rise" among her provinces beyond the sea. Yet we can believe that, in the eye of the men of earlier times, the *arx* of Tusculum on its mountain height may have seemed to have a right to look down with scorn on the fortresses on the Palatine and the Capitoline, mere molehills by the side of the river. The height was a citadel formed by nature, so steep and rocky that the greater part of its circuit needed no artificial defences; its very gateway was already made; the men who first fortified the height had merely to hang their gate—the socket may still be seen—between two masses of rock which stood ready to receive it. On one side only, and that ominously the Romeward side, the hill is less steep and rugged, and there alone vestiges can be traced of a wall of massive square stones, like the earliest walls of Rome, and of a gate and approach made by the hand of man. The height of Tusculum was a point exactly fitted for the settlement of a primitive people in prehistoric times; it was no less fitted in after times to become the culture's nest of a robber noble. But, small as are the traces of the wall of the Tusculan Dictators, some traces there still are, while of the works of the Tusculan Counts not a stone is left.

Within the *arx* the foundations of several buildings can be traced, and the sides of the hill are honeycombed with grottoes, chambers, whatever one chooses to call them, in a way which reminds one of Nottingham Castle. But the best preserved Roman remains, and what is, after all, the most remarkable remnant of the ante-Roman city, are found on the lower level. There are the theatre, the reservoir, the odd little set of semicircular steps which some call a "children's theatre," and others, more reasonably, a lecture-room; there is the open space that was the forum, and a mass of sculpture and architectural details built up into a modern but forsaken house. All these are plain enough to be seen; but the traveller might possibly miss what is far more precious than any of them. To the left of the theatre, as we go upwards, a little way down the steep and rugged path up which Macaulay leads the dark-grey charger of Mamilius, is a grand fragment of the town-wall, and, better than all, there is an undoubted monument of primitive times in a chamber roofed, like the Tullianum at Rome, not with the real, but with the apparent, arch. It is one of those examples of that striving after the arch, before its full construction was reached, of which there are so many examples in early works in Italy, Greece, and elsewhere. And here, as in many other cases, the form which the apparent arch takes is not round but pointed—the guide points to it as "*arco ttonico*." It would not be beyond the bounds of possibility that some may believe that it is the work of Alaric or Totilas. It proves, like so many other examples, that the mere form of the pointed arch is at least as old as the round. But it was not till a good deal more than a millennium after the days of Tusculum that the Saracens first learned to use it as the main constructive feature of great buildings, and it was not till some centuries later again that the architects of North-Western Europe provided it with an appropriate form of moulding and ornament. We come up again to the level of the theatre, we pass along the ancient pavement, we mark the wheel-tracks which may have been made by the wheels of Cicero, we pass the ruins of what calls itself his villa, we come again to the amphitheatre, and our visit to Tusculum is done. We have seen the memorials of the Dictators, and we need not look for the memorials of the Counts. We see that mediæval Rome had at least not forgotten the art of Mummification, that she could still sweep with the besom of destruction, when vengeance or policy called for the utter rooting-up of a rival.

DIVIDED ALLEGIANCE.

THE ball set going by Mr. Gladstone continues to roll merrily. One after another his champions and assailants in the Roman Catholic body are coming forward to speak their mind with a zeal and directness which probably exceeds his most sanguine expectations. Large, however, as is the volume of correspondence which has inundated the columns of the *Times*, even since we last called attention to the subject a week ago, the controversy is still centred round one or two crucial points, and every letter supplies a fresh proof alike of the general loyalty of the Catholic body, and of the open or latent inconsistencies by which the Ultramontane section of it manage to maintain in violation their profession of concurrent allegiance. To adopt The O'Donoghue's phrase, which is peculiarly applicable to his own lucubrations in Monday's *Times*, "amazement is the prevailing condition of mind at the expenditure of so much rhetoric" in order to prove the entire compatibility, not only in the concrete, which we readily admit, but in the abstract, of a hearty acceptance of the Vatican Decrees with an entire "loyalty to the Crown and Constitution." The substance of his letter, which occupies nearly a column, may be summed up in one sentence. He is very angry with Mr. Gladstone; he is well assured of the civil loyalty and allegiance of his co-religionists, which was remarkably exemplified in Archbishop Manning's presiding, "even on a Sunday," over "a monster meeting of Protestant workmen"—according to the reports a large proportion of them were Irish Catholics—in Hyde Park; he "glories in proclaiming his entire submission to the authority of the Pope," and means to bring up his children in the same principles, and not "like the couple of dozen nineteenth-century Catholics," such as Lord Acton and Lord Camoys, who "sear beyond their wits"; and lastly, he carried out his entire submission, though this is rather implied than expressly stated, by voting in the last Session of Parliament against Mr.

Gladstone's Irish University Bill. We respect The O'Donoghue's evident sincerity, and fully recognize his loyalty. But the course pursued by him, in common with nearly all the Irish Roman Catholic members on the occasion just referred to, and for which Mr. Dense takes especial credit in the *Times* of Tuesday, was quite correctly described the other day in the reported conversation of Dr. Dollinger with a Correspondent of the *New York Herald*. The proposed measure, whatever might be its merits or demerits in other respects, was, even in its amended form, a large concession to Roman Catholic claims, but it did not concede everything, and accordingly the Irish members were directed by their Bishops, "who had received orders from Rome to use all means in their power to oppose it," to throw out the Bill. And the same policy would of course be repeated in any similar case. A very different state of things certainly from that existing some thirty or forty years ago, when, as we are reminded in Mr. Greville's Journal, the Irish Catholic Bishops were virtually nominated by the British Government, who, whenever a vacancy occurred, regularly applied, through an officious diplomatic agent, to the Holy See, which almost invariably acceded to their suggestion.

Between the fervidrodomontade of The O'Donoghue and the calm and measured gravity of the letter which immediately followed his in the *Times* there is a very long interval. Mr. De Lisle writes with the culture, the courtesy, and the sober self-restraint of an educated English gentleman, and he can hardly, even by Mgr. Capel or the *Tablet*, be hustled out of court as a disaffected or "apostate" member of his Church. On the contrary, he has been known for years as one of the most munificent benefactors of the religion in whose service his pen has also been constantly employed, having himself founded an abbey on his estates and built several Roman Catholic churches. Nevertheless he "has no hesitation" in expressing his satisfaction at the appearance of Mr. Gladstone's pamphlet, and insisting on the necessity of proving that the conditions on which Catholic Emancipation was granted have not been weakened or annulled. And he not only joins emphatically in Sir George Bowyer's protest against Mgr. Capel's assertion of the supremacy of the ecclesiastical over the civil power, but pronounces a severe censure on "the fatal exaggerations of men who on all occasions are ready to rush to the front ranks of the Catholic body, as if they and they alone were the accredited champions of the Catholic cause." This reminds us of the "Lay Catholic's" challenge to the "Catholic Union" to produce its warrant for pompously announcing what "the Catholics of Great Britain" believe and think, which is indeed rather too much like the famous proclamation of the three tailors of Tooley Street. Mr. De Lisle particularly instances and rebukes a statement of Mgr. Patterson's in the *Contemporary Review*, "that the authority of the Popes is absolute and unlimited over all persons, whether sovereigns or subjects." Such pretensions, he thinks, "will evidently be endured no longer," but nevertheless he declares his hearty acceptance of the Decrees of the Vatican Council, and thereby does certainly lay himself open to an obvious retort. We do not here refer exclusively or chiefly to Mr. Archer Shee's very pertinent comment, that the Vatican Decrees are not even in form the decrees of a Council at all, but simply a declaration of the Pope himself, issued "with the approval of the Council," whereas the Decrees of Trent, as of all the ancient Œcumenical Synods, run in the name of the Council itself, not of the Pope. This is perfectly true, and Dr. Johnson's verbose reply, far from meeting the real point of the objection, distinctly confirms it; indeed Cardinal Antonelli, when officially announcing the publication of the infallibilist dogma, styled it, not a conciliar decree, but "an Apostolic (i.e. Papal) Constitution." But it is still more to our purpose to observe that Mgr. Patterson's assertion, which Mr. De Lisle so strongly condemns, is an almost verbal reproduction, in a somewhat modified form, of the claim asserted in the famous Bull *Unam Sanctam*, which all Ultramontanes justly regard as infallible. Boniface VIII. there "defines and pronounces" that "it is absolutely necessary for salvation for every human creature to be subject to the Roman Pontiff." And the context, as well as the circumstances under which the Bull was issued, during the Pope's quarrel with Philip the Fair, abundantly proves that temporal subjection was inclusively, or rather primarily, intended and understood. Philip accordingly lost no time in replying, in language more forcible than courtly, "Let thy supreme folly know that in temporals we are subject to no man" (*Sciat maxima tua fatuitas in temporalibus nos dicui non subesse*). We do not clearly see how Mr. De Lisle can reconcile his hearty acceptance of the Vatican Decrees with his rejection of this *ex cathedra* Papal definition, or how he can look for an authoritative explanation, which shall be satisfactory to himself and to the outside public, from "our Apostolic Bishops," who notoriously act under the control of Archbishop Manning.

Lord Acton's letter in the *Times* of Tuesday last has a twofold importance, though it need not detain us long. In the first place, when he declares that the communion of his Church is "dearer to him than life," and that it "stands on the sure ground of an institution and a guidance that are divine," he sufficiently disposes of the coarse and vulgar vituperation of those who denounce him as the member of "an apostate triumvirate." In the next place he has now met the challenge addressed to him by Mgr. Capel and other assailants by producing the evidence for his "atrocious charges" with a fulness and precision for which perhaps they were hardly prepared. In one minor point indeed, which has no direct bearing on his argument, we notice what looks like a slip of the pen. Surely James I.'s Queen, Anne of Denmark, was not

a Catholic. And it would perhaps have been as well to add to his statement about Huss, that, as Palacky himself points out in his *History of Bohemia*, the safe-conduct for his journey was not intended to guarantee him against the sentence of the Council. It is hardly necessary, after Lord Acton has thus completely "verified his charges," to discuss Lord Arundell of Wardour's strange assertion "that during the last two centuries no Pope has trenchanted upon the political ground," which was implicitly refuted by our extracts last week from the *Dublin Review*. Nor is the distinction of much consequence, even if it could be established, for the Syllabus declares that no Pope has ever exceeded his legitimate rights, and Lord Arundell will hardly deny that many of the mediæval Popes have trenchanted very considerably upon the political ground. We are glad, however, to observe that he disagrees with Canon Oakley and the Syllabus in affirming the abstract principle, as well as the present expediency, of liberty of conscience; while he also repudiates Mgr. Capel's views, who is, by the way, summarily put aside by another of his co-religionists, Mr. O'Donnell, as neither a canonist nor a theologian. We may add that Bishop Ullathorne's angry and intemperate Pastoral contributes no fresh matter to the controversy, beyond the vigorous assertion of his extreme displeasure both with Mr. Gladstone and with those members of his own communion who do not, as one of them has happily phrased it, "share his quarrel with the facts of history and the laws of thought."

Meanwhile the practical application of divided allegiance has been illustrated during the last few days in an unexpected manner, and in a sphere to which Mgr. Capel went out of his way to call attention in his not very felicitous letter to the *Times*. The obligations of the Fourth Commandment, he reminded us, must be limited by the duty to obey God rather than a parent, and a correspondence published in the same paper last Tuesday affords rather startling evidence of the sense in which Archbishop Manning understands that limitation. The affair is altogether so very significant in more ways than one, and has so obvious a connexion with the subject under review, that we may be excused for putting on record its main incidents here. It appears that Mr. Browne, an undergraduate at New College who had taken honours in Moderations, and was reading for a class in the final schools, has lately become a Roman Catholic. His father very naturally wished him to remain at Oxford, which he could do without any interference with his religion, till he had completed his University course, but on writing to him to that effect, received the following reply:—

Since I saw you I have been to London to see the Archbishop of Westminster, and to learn from him the mind of the Church as relating to my future course. When I had laid the whole matter before him, I assure you I was much surprised to hear that the Holy See has expressly condemned the English Universities as dangerous to faith and morals. This being the case, the Archbishop could only give me one reply to my question—an unconditional negative; and, as I have submitted my judgment to that of the Church, the only course for me is acquiescence in his decision.

Whereupon Mr. Browne senior wrote a courteous letter to the Archbishop to inquire if his son had rightly understood him, and expressing his surprise that such an objection should be raised by "a Church professing to encourage learning." To this inquiry the Archbishop's secretary replied:—

I am desired by the Archbishop to acknowledge your letter of the 26th inst., and to forward to you a copy of the Pastoral Letter of the Bishops, where you will find, on p. 10, the directions of the Holy See on the subject of the English Universities.

The passage quoted in the Pastoral, to which we called attention at the time*, contains no "directions of the Holy See," but simply a "declaration" adverse to the English Universities, first issued in the year of Dr. Manning's elevation to the see of Westminster, and a few days before the death of Cardinal Wiseman, who—though not himself, like his successor, an Oxford man—had never supported this arbitrary policy of obscurantism. It was notorious at the time that the declaration had been obtained by the strenuous efforts of Dr. Manning, in opposition to the known opinions of many of the Roman Catholic Bishops and clergy, and the avowed desire of a large body of the laity, who had formally deprecated it, and had come forward to offer their moral and material support to Dr. Newman's scheme of opening a Hall at Oxford. Mr. Paley, himself a zealous convert, lost no time in denouncing the grievous "mistake" of the declaration published in last year's Pastoral, and testifying, on the strength of forty years residence at Cambridge, that "not only is the utmost respect and consideration shown by all for the convictions of Catholics, but the morality of students is now more carefully watched and protected than perhaps it can be anywhere away from home." When the first rumours were heard of the Bishops forbidding students to resort to Oxford and Cambridge, a well-known Abbot, now removed from the scene, observed, "Then they won't be obeyed." And in fact, ever since the abolition of tests, there have always been, as there are now, several Roman Catholic undergraduates at Oxford, and a good many cases have also occurred like Mr. Browne's of conversions taking place during the University career without any interruption of the curriculum. It has been reserved for Dr. Manning not only to force the hand of Rome against the known opinions and wishes of a large (probably much the largest) part of his co-religionists, but to press a declaration into a command, which Rome has had the characteristic discretion to withhold; and he has done this in the obviously exceptional case of a convert already more than half way through his Oxford course, whose career and

prosperity for life may be blighted by this high-handed act of arbitrary interference with parental authority. That the "faith" of a neophyte, in all the fresh fervour of conversion, would be endangered by a year's longer residence at Oxford will hardly be seriously maintained; and Dr. Manning at least knows quite enough of the ways of Oxford and the ways of the world to be well aware that "morals" are to the full as safe in an Oxford College as in London. But no means are to be spared to beat up recruits for Mgr. Capel's rising little academy at Kensington, which can hardly be expected to compete successfully by its own unaided merits, however distinguished, with the older English Universities. It remains to be seen whether Roman Catholic parents will be as submissive as Mr. Browne junior in accepting the Archbishop's "unconditional negative."

It is at all events amusing, after reading the correspondence columns of the *Times* for the last three weeks, to turn to a *Reply to Mr. Gladstone* just published by a Monk of St. Augustine's, Ramsgate. The Monk, who writes with the shallow self-sufficiency, and in the slangy dialect, of a sharp and bumptious schoolboy, does succeed in detecting a few mistakes of detail in Mr. Gladstone's reading of the Syllabus, especially as to the sacrament of marriage. But what is to be thought of the historical knowledge of a writer who asserts that the Acts of the Council of Constance prove nothing as to the right of an Ecumenical Council to sit in judgment on a Pope, which right it formally defined and summarily exercised by deposing John XXIII.; or of his acquaintance with modern theology, when he "simply denies" that there is any difference of opinion among "present Catholic divines" as to the meaning of the term *ex cathedra*? Still more astonishing, however, in the face of recent revelations, is his bouncing asseveration that no single Catholic dreams of not accepting the Vatican Decrees "as oracles of the Holy Ghost." We are almost tempted to reply, in his own words, "Now, in the name of everything absurd, what does all this mean?" Nor are we much enlightened by two explanatory letters which appeared in the *Times* yesterday. Mgr. Capel, who is evidently alarmed at the storm he has raised about his head, writes to say that "the personal infallibility of the Pope" was no phrase of his, but was cited in inverted commas from Lord Camoys's letter. Of course it was, but it was cited for the purpose of saying that, "if Lord Camoys seriously and obstinately refuses to accept 'the doctrine of the personal infallibility of the Pope,' then does he make shipwreck of the faith, and *ipso facto* separate himself from communion with the Church and See of St. Peter." If this does not mean that "the doctrine of the personal infallibility" is an essential condition of orthodoxy and Church membership, we must confess our inability to attach any meaning at all to the words. Dr. Johnson is not much happier in his attempt to answer Mr. See; to his other critic he does not even profess to offer a reply. The fundamental difference between the form of the "Papal Constitutions" of the Vatican Council and the conciliar decrees of Trent remains just where it was before, and the change was deliberately made against the protest of many of the Bishops. As to his four conditions of an Ecumenical Council, the first and last depend solely for their validity on the Vatican Decrees, and cannot therefore be alleged in evidence of the validity of those decrees, and not one of the four will bear the test of history. Every fresh attempt to bolster up those unfortunate dogmas seems only to reveal more clearly the hopelessness of the task.

PLAIN COOKS' MISTRESSES.

WHEN a young professional man marries, he often fondly imagines he is acting wisely in choosing his wife from a family poorer than his own. He fancies that a young lady brought up with few luxuries will be simple in her ideas. He calculates that, having never had money to spend, she will be moderate in her expenditure; that, being a poor man's daughter, she is the better fitted for the part of a poor man's wife; and that, having lived in a household supported on, say, 400*l.* a year, she will be easily able to make ends meet where there is 500*l.* He could hardly make a greater mistake. There are brilliant exceptions, no doubt. But the girl who has never had money to spend, and who has never seen money spent, has no idea of how to spend it when she has it. She thinks 500*l.* a year a fortune. Her notions of what may be done with it are perfectly unlimited. Broughams, little dinners, an occasional box at Covent Garden, Mudie's, a maid, lots of new dresses, gloves that need never be cleaned or mended, all these and other visions float through her mind. She is of course very soon awakened to realities, and is at first amazed at the rapidity with which her housekeeping allowance melts away. The region of extras is never reached, and it is well if she does not soon get into debt with her weekly bills, or forestall her income to pay for something she has ordered without having counted the cost. A man with a small income consults his future comfort to much better purpose by choosing a wife where there is money, even if he is not to have any share of it with her. If she has seen her father give hundreds of pounds for a picture or a horse, she at least knows how much such things cost; and if, as in most families of the kind, the young ladies have a regular allowance, she is able to tell how much will be required for dress, and how impossible it will be to have any of the things which an inexperienced wife will wish for and perhaps expect. She has also the advantage of knowing how little married happiness really depends upon such things, and how small is the gratification to be obtained from

possessing them. And she probably knows that extravagance is just as fatal to 50,000*l.* a year as to 500*l.*, and that to keep out of debt requires management, whatever the amount of the annual income. Accustomed to many servants, she knows what care will be needed to get the work of even a small house done by two; and so she helps them as much as possible, will take a share in the dusting, especially of ornaments, will not hesitate to go to the hall door when they are busy. On Sunday afternoons she will receive the milk in the orthodox manner through the area rails, rather than keep the cook from performing her devotions or taking a walk with her sweetheart. Even if she is not a good housekeeper, her servants have some consideration for her in return, and perhaps even occasionally endeavour to be saving and careful in their own departments. But such mistresses are rare, and the man who has one of them for his wife is fortunate. Too often the young and inexperienced woman begins married life with the idea that having servants and a house of her own means simply doing just what she likes. She probably commences with a protracted fit of three-volume novels, the first fruits of her emancipation from her mother and schoolmistress. She reads them reclining on her sofa, and often hurts her health by alternately spending all the day in a close atmosphere and taking long walks on damp afternoons to look in at shop windows—another pleasure hitherto forbidden. She is addicted to wearing tight stays and high-heeled boots, and eats chocolate between her meals. She rises so late that breakfast is always a scramble; and as she has not remembered to order it the night before, her husband is often obliged to be off before the eggs or the ham have been procured. If he is at all demonstrative, the chances are that he goes to his day's work leaving the wife of his bosom in tears; and there are men so weak that a scene in the morning, and a bad breakfast, will unhinge them for the day. But such feelings become blunted before long, and the husband who does not die of having to work almost fasting survives to make his wife wonder how she could have married him.

After breakfast and the departure of her husband, she descends to the kitchen. Her temper is already ruffled. Her dress, owing to the hurry of her toilet, is unbecoming, often untidy; and, disordered herself, she proceeds to order dinner. Her own condition is admirably reflected in that of the kitchen and the cook. Having made no plan beforehand, and having no idea of how best to use the things already in the house, she leaves it to the cook to suggest what will give her the least trouble, and is not sorry when her own part of the business is over. The air of the kitchen is not so sweet as to make it pleasant to stay there long; and she departs with relief when the invariable mutton and rice pudding has been proposed by the cook and adopted by the mistress. No thought of going out to see what may be had in the market, no idea of choosing vegetables or meat, ever crosses her mind. She is quite content that the greengrocer and the butcher should serve her at their own will, and allows her cook, who by this time should be busy with the servants' dinner, to go out for what is required, while she herself retires to her room. Her education has only taught her the necessity of following the fashion, and she probably puts off her novel-reading while she occupies her time with trying to imitate in cheap materials a dress she has seen on some one else, though its beauty may have consisted in the cunning cutting out of an experienced hand, or in the appropriate adjustment of costly lace. Meanwhile her servants get through their work as they please, their slovenly hands learning no neatness from her example, and their experience teaching them only how to do as little as possible for their wages. Her view of housekeeping consists chiefly in locking everything up, and in giving out without any accurate knowledge of how much or how little is really required. The cook is trusted with money to pay the tradesmen, and if she pockets the money and leaves the bills to be paid when she has gone to another place, no one is more surprised than her mistress. Such things happen even in well-regulated households, and they are common occurrences where the mistress knows nothing of the value of ready money, the blame seldom falling where it should. Servants are taught dishonesty by neglect, and are often as much demoralized by too little trust as by too much. Unthrift and waste are the precursors of peculation, and the mistress who locks everything up, and then leaves her keys lying about, can hardly be brought to see that it would be much better to leave all her cupboards open and depend for security on her knowledge of what is in them. Such housekeepers never have a hammer where it may be found to knock in a nail; they never put by a piece of string; they never keep a little store of wrapping-paper for parcels. There are no neat covers provided for the furniture at night, nor clean dusters and brushes for private use. The handles come off the doors and remain loose for weeks, and the door-keys are always lost, or are fitted into the wrong locks. The cat has easy ingress to the meat-safe through a hole in the canvas; the mice and the bluebottles revel in the larder. There is only one corkscrew for the use of the family above stairs and down, and it is always missing when it is wanted on either story. There is running to and fro if a friend drops in for luncheon, and the visitor is always kept waiting a quarter of an hour before the lady of the house comes down. The kettle is never boiling for afternoon tea, and the bread and butter is always cut with a knife redolent of onion. The clock on the mantelpiece has always run down, or strikes half-past eleven when the hands point at four. Bradshaw is never to be found, and if found it would be useless,

as no one can interpret its mysteries. The smell of cooking pervades the house to its topmost chambers, and appetite is forestalled by the odour of roast mutton or fried herrings. The holes in the table-cloth or the chair-covers are never darned. The dish-covers are always broken. The mustard is dry in the mustard-pot, and the coffee is full of grounds. The housemaid's duster lies on the drawing-room hearth-rug, and the ornamental handles of the fire-irons are always loose. There is never any water in the bedroom ewers, and a guest who asks to wash his hands has to put up with a damp towel. The tap of the beer-barrel never fits, and hot water is served up in a milky jug. The bells will not ring, and orders are given at table in a stage whisper, and are often repeated before they receive any attention. The husband who brings an unexpected friend to dine has to supplement his indiscreet hospitality with apologies, and afterwards to pay the penalty of his rashness by receiving a private lecture. The buttons are always off his shirts, and the handkerchiefs in his drawer bear other people's names. He has to make a favour of getting his boots in the morning, and should he be so unwary as to descend to the lower regions to fetch them for himself, the chances are that he finds the cook superintending the toast with one hand, while the other is plunged into the recesses of a Wellington. The splash of mud remain on his coat and trousers till he invests a penny in the good offices of a shoeblick at some windy corner; his hat is brushed the wrong way, and bears on its front the marks of a greasy finger. He is summoned by the police because his chimneys take fire, or because the lid of the coal-hole is left unfastened. The servants of such a household are not remarkable for civility, and can never by their conciliatory manners mitigate the sternness of the policeman. They take their tone from those whom they serve, and no unnecessary efforts of politeness adorn the social usages of the street door.

The mistress of such a household is necessarily the most useless person in it. She can do nothing herself, and is quite unable to see anything properly done by her servants. She cannot put up a blind, or fit a chintz cover to a chair. Her orders are contradictory, and her complaints loud and many. She blames her domestics for her own neglect, and, while she grumbles at their inefficiency, she cannot herself show them how to do anything. Her dress is always stained with the droppings of her tereup, and she has no intermediate state between untidiness and finery. She puts on her best clothes for a morning walk, and keeps nothing for her visiting days. Her piano always wants tuning, and she never remembers the date of the tax-collector's visit. She forgets her gloves or her card-case till she has arrived at the hall door, and when they are brought the gloves always want buttons, and there are no curls in the case. She never learns the rate of postage, and writes her foreign letters after the mail has gone out. A drive in a cab involves a fight about the fare, and she brushes the muddy wheel with her dress in getting out. She expects her servants to do everything without instructions, and usually speaks of them as "wretches." While she exacts obsequious respect from them, she talks before them of their shortcomings. She gives them needless trouble by her laziness or carelessness, and, while she does nothing for their comfort, expects them to study hers constantly. She will thoughtlessly ring them up to the top of the house to put on the coals which are in the scuttle beside her chair, and will heedlessly send them three or four errands when a little forethought on her part would have made one enough. She never interests herself in their welfare, hardly knows their names, never spares them when they are ill, or thinks of how she may save them trouble. She provides no wholesome literature for their leisure reading, and does not inquire after the proper investment of their little savings. Their wages are always in arrear, and she habitually tempts their honesty by leaving her purse or her letters lying about, and yet frequently suspects them without cause. She charges them with theft and untruthfulness on the smallest grounds, and constantly fancies they are looking at her through the keyhole or listening behind the door. She is indignant when they give her notice, and refuses them a character when she finds that they cannot compel her to give them one. She knows nothing of them after they leave her, and never concerns herself to get them places. She expects them both to be up before her in the morning and also to sit up late for her at night. If she is ill they must attend her like nurses, rise to her call at all hours of the night, and work for her in every respect as if they loved her.

TEN YEARS OF AMERICAN RADICALISM.

THE great political revulsion which has taken place in the United States, like that equally sudden and complete reverse of party fortunes effected in this country by the general election of last February, was preceded by ominous symptoms which the party in power persistently disregarded. Extreme partisans have ascribed one defeat after another to local or trivial causes, and have even tried to explain away the total result by reference to influences merely selfish, or to prejudices wholly ungrounded, just as the reaction in England has been imputed by the less rational and respectable of the defeated party to "Beer and Bible"—the sinister objects of the publican and the unfounded alarms of the advocates of religious education. The truth is that in each instance public opinion has tardily but decidedly condemned the policy and repudiated the aims of the party lately supreme, and that upon general and very grave con-

siderations. The American reaction at any rate will be sufficiently intelligible to any habitual student of United States politics who has had an opportunity of supplementing the ordinary sources of information by personal observation of the results of past misgovernment.

The condition of the conquered States of the South, after nearly ten years of peace and subjection, could not but be a subject of grave anxiety to every intelligent and patriotic American, and of bitter reproach against the Radicals. The latter had had everything their own way. They had possessed such overwhelming majorities in both Houses of Congress that even under the Administration of Andrew Johnson they had been able to carry all their measures over the President's veto, and to impose upon the South just such Governments and such rulers as they pleased. Since March 1869 they had controlled the Executive as well as the Legislative power, and, with very little regard even to the plainest and most clearly expressed constitutional restrictions, had governed the ex-Confederate States at their own discretion. If, then, they had failed, their failure was in itself a sufficient evidence either of culpability or incapacity. And their failure was signal and notorious. The Louisiana revolution brought it home to the understandings of the Northern people with peculiar force. Mr. Kellogg's Government claimed to have been duly elected by the negro majority in that State, but as a matter of fact everybody knew that it had been installed in power by Radical intrigue through the instrumentality of Federal bayonets, for no other reason than that it was Radical, and would put the offices and resources of the State at the service of Radical jobbers, and its votes at the service of the Washington Government. The undisguised dishonesty and injustice of this Administration, and its schemes for maintaining itself indefinitely through the disfranchisement of the respectable citizens and the falsification of the ballot, its relations with leading Radicals at Washington, its corruption and shamelessness, were familiar to politicians; but its sudden collapse before the insurrection of last summer proved them to all the world, and exposed moreover the fact that it had no support whatever among its own constituents. Every respectable journal, every sober citizen in the North, was utterly ashamed of the treatment of Louisiana, and of the conduct of the Federal Government towards it. The scandal thus created drew serious attention to the other grievances of the South, and it was impossible that Radicalism should survive such attention when once fairly roused.

The first palpable fact was that, in order to secure the control of the Southern votes for their party, and of the State Treasuries for their hangers-on, the Radicals had placed the conquered States absolutely in the hands not merely of bitter partisans, ignorant of the condition and difficulties of the country, and hostile to its people, but of the very scum of the camp and the caucus, of suttlers and of low electioneering agents, and had sustained these men in a systematic dishonesty which has probably no parallel in European annals. Millions had been borrowed, at a time when it was obvious that only the strictest economy could enable the States ever to pay their way and restore their credit; borrowed on disadvantageous terms from Radical money-lenders and jobbers, and embezzled by Radical Governors, Legislators, Secretaries, and Treasurers; and not a fourth of the sum had ever been laid out, even in form, for the benefit of the borrowing State. To pay the interest, and enable the Government to borrow more, enormous direct taxes were levied on property that was almost wholly unproductive. For the South, after the war, had nothing left but her lands; and her agricultural labour (the negro population) was demoralized and disorganized. Large quantities of valuable land have been sold for taxes alone. Virginia is the most fortunate of the late Confederate States; she has a large majority of whites, and she has recovered her self-government, and is ruled by honest and high-minded men. Yet Virginia pays in direct taxes at least one-third of her entire income, and even so cannot meet the interest on her debt. South Carolina is simply ruined; her whole realizable wealth would hardly suffice to meet the obligations fraudulently imposed on her. Texas and Georgia are more fortunate, and the States west of the Mississippi may probably recover themselves in due time. But at this moment the South is almost as poor as on the day after General Lee's surrender, scarcely less disordered, and very much more disaffected. And this is entirely the result of Radical government, administered on two leading principles—to depress and punish the Southern people for their rebellion, and to manipulate the negro vote in the interest of the Radical party. The former object has been pursued so effectually that the white people in the Cotton States, finding that no justice or protection was to be had from the law, have been driven into protecting and redressing themselves; whence Ku-Klux combinations, outrages, and spasmodic anarchy. What the Southerners are when left to themselves may be seen in Virginia, which is as secure and orderly as Lancashire, and where the negro is as safe as an English mechanic from oppression or ill-usage. In order to keep the negro in hand, and control his vote, the Radicals have had systematically to prejudice him against his white neighbour; to persuade him, first, that his old masters wished to re-enslave him; when this fiction ceased to seem credible, then to promise him one impossibility after another—a division of the lands, social equality, and so forth—and to keep alive the antagonism of races by fanning to the uttermost the passions of an excitable and intensely ignorant populace. The consequences are bad enough; they might well have been worse. The negro is not addicted to deliberate bloodshed or ferocious revenge. But he is an habitual thief; and it is the universal complaint of Southerners

that no one living among blacks "can keep anything smaller than a cow"—an inconvenience which they endure with marvellous patience and good humour. He is inveterately indolent and unsteady; and has a special dislike to agricultural life and labour. Southern crops have several critical seasons in the year, when the entire crop depends upon one or two weeks' work done at the right moment with energy and perseverance. Now no contracts will prevent the negroes, if they take it into their heads, from deserting their employer just at such a season. Even the plan of working "on shares" fails; for the negro, having to live and having nothing to live on, has generally drawn by way of advance the full value of his labour from day to day, and loses little by decamping at any moment. Radical legislation of course does nothing to check this vice, and Radical agitation does much to encourage it. Worst of all, Radical harangues on equality and denunciations of white exclusiveness have taught the negro to look upon the women of the white race as upon those of his own colour; and the consequence is that, in the districts and States where the negroes preponderate, ladies cannot with safety venture far from their homes or their protectors. Hence arises the only savage feeling of which we have ever seen any symptom on the part of the whites; hence, now and then, come fearful acts of terror-striking retribution. The last and most culpable incitement held out by Radical agitation to negro ignorance was the Civil Rights Bill, which was intended to force, not merely civil equality, but social intermixture, on the Southern whites—to compel the admission of negroes and negroesses to all railway cars, to hotels, to ladies' rooms on board steamboats, and of negro children to white schools. Such a measure would simply have reduced the entire society of the South to a state of anarchy, and have produced civil war in every town and village, collisions in every street car and railway train; and if there were no other consideration involved, the defeat of this insane and reckless project would alone be a sufficient reason for rejoicing over the late Conservative victory.

The uncompensated emancipation of the slaves was of course a grievous injury to the Southern people. It was the confiscation of a particular kind of property; the spoliation of certain families selected by hazard, and without the least regard to their participation in Secession and civil war. Necessity, however, might have excused this; and, had confiscation ended here, it would have been forgiven, as the wholesale devastation and systematic robbery committed during and after the war by Federal officers and soldiers have been forgiven. But the compulsory repudiation of all State and municipal debts incurred, for whatever purpose, during the war, was a gratuitous iniquity. Those who lent to the Confederate Government of course staked their money on the event of the war. Those who lent to the State of Virginia or the town of Lynchburg were chiefly the trustees of family settlements, with whom the local funds were always a favourite investment; and when Congress forced the States to repudiate these debts as a condition of restoration to self-government, it did in fact compel them to rob tens of thousands of widows and orphans. The Southerners say that they will never forget the cruelty which made them agents in their own dishonour, or the hundred other acts of tyranny, wrong, and insult which make up the record of the Radical party. They felt far less bitterly towards the Union in May 1865 than in October 1874.

But not even the alienation, impoverishment, spoliation, and ruin of the finest section of the Union has so much disgusted and irritated the Northern people, and contributed to the defeat of the Radicals, as the wholesale dishonesty which under their rule has pervaded every department and every rank of official and political life, from Cabinet Ministers to excisemen, from Senators of the United States to negro Assemblymen in Florida or Mississippi. Englishmen visiting America a few weeks ago heard only one opinion and one sentiment on this subject. It was admitted by all but the most extravagant partisans that the whole Federal service was utterly rotten; that everybody speculated, embezzled, and took bribes; that if a few of the highest officials kept their hands clear of actual participation in the frauds of their subordinates, they permitted and screened them, and used their own opportunities to realize fortunes by gambling in stocks on the strength of official secrets. The *entourage* of General Grant was popularly spoken of by the significant name of "the Washington Ring." It was assumed that Congressmen and Senators were now generally corrupt; and it was distinctly affirmed that bribery, though not unknown in State Legislatures, was never even imputed to the representatives of the nation before 1861. The example set by the officials and legislators of the central Government had infected commerce and society. Railway officers were charged with using their powers to extort profit for themselves from those who depended on markets which could only be reached by a single line. We have heard of men who had opened mines or works in the West in reliance on a scale of freights arranged with the railway officials; who, when their money was sunk and their goods were ready for transit, received visits from those officials, and were asked to give them an interest in the enterprise; and who, on refusing, were at once checked in their business by extravagant freights, and compelled to close their works. Many of the accusations so freely made may have been more or less exaggerated, but nevertheless the conviction was universal that corruption of every sort pervaded Congress and the Government, and had thence penetrated throughout the commercial classes and the framework of society; and the only plea commonly put forward *per contra* was that, if

the Radicals were turned out, they would be succeeded by a swarm not more scrupulous, and more ravenously hungry. The disgust inspired by the prevalent dishonesty was, we believe, a main reason of the overwhelming defeat of the Government.

No doubt local causes and minor questions had here and there much to do with particular elections; but they probably told as much on one side as on the other. The lines which divide Free-traders from Protectionists, inflationists from ballionists, and so forth, run at various angles across the one great demarcation that severs Conservatives from Radicals, and coincide rather with geographical than with party boundaries. Two considerations of a special character probably did contribute to the defeat of the Radicals. The first was that strong feeling of hostility to the great Railroad Companies which from various causes has sprung up in the West. The Government was supposed—we know not why—to sympathize with the railroads, and suffered accordingly. The "third term" was another disadvantage. The Radicals could not effectually repudiate it, lest they should need General Grant's help; and he, for reasons of his own, would not assist them by decisively renouncing all aspirations to an honour declined on constitutional grounds by Washington himself. The objection to a third election of the same man to the Presidency is perhaps more deeply rooted in the public mind than any other constitutional doctrine; and the suspicion which it might be disregarded by the Republicans—a suspicion which the only person able to dispel it allowed to exist and to be confirmed by his silence up to the last moment—probably cost them thousands of votes.

On the whole, the result of the late contest may be viewed with satisfaction by all who wish well to the United States. It is a merited and much-needed rebuke to political profligacy; and it will probably put an end to the cruel and sordid tyranny which has for nearly ten years laboured to crush the spirit, paralyse the energies, and drain the resources of six millions of the American people. But it presents one aspect which is not so promising. It is not only a victory of the Constitutionalists over the Revolutionists, of law and right over force and usurpation; it is also a victory of the agricultural and taxpaying West and South over the commercial and money-lending communities of the East. There is a strong feeling in the West against the payment of the debt in gold; and it may be questioned whether the South will consider itself under any obligation to respect the credit of those who have dishonoured her own. It may be remembered that the Radical party itself has more than once shown a leaning towards the views of General Butler on this subject; and it may be feared that recent events have not improved the position of the foreign holders of United States stock.

MR. CARLYLE ON BOSWELL.

IN the whole of literature there is scarcely a stronger contrast to be found than that which exists between the two celebrated reviews of Boswell's *Life of Johnson*. Lord Macaulay was, we think, carried by his love of paradox and his hatred of Tories as far wrong in one direction as Mr. Carlyle by his love of hero-worship and his utter indifference both to Whigs and Tories was carried in another direction. There are those who imagine that between two opposite characters that are given of the same man a kind of balance can be struck which shall not be far removed from the truth. Character, however, admits of such infinite variety that it may well happen that the truth lies not between any two opposing views, but in some altogether different direction. Though the study of both Boswell and Johnson as drawn by these great reviewers is very interesting, yet we doubt whether in their pages there is to be found, even by a man who is well skilled in weighing arguments and balancing opposing statements, an accurate estimate of the two men. It would go far beyond our ordinary limits to discuss the question as a whole. We shall content ourselves for the present with the consideration of one point in Mr. Carlyle's view of Boswell's character.

Lord Macaulay, as our readers will remember, had represented Boswell as everything that was contemptible and mean. It was no hard matter to upset this outrageous view, and Mr. Carlyle has done it most thoroughly. Even he, we think, in some points, has not done full justice to Boswell's character. In one respect, however, he has, we conceive, exaggerated his merits. It is to this we shall now invite attention. "Loyalty, Discipleship," he writes, "all that was ever meant by *Hero-worship*, lives perennially in the human bosom, and waits, even in these dead days, only for occasions to unfold it, and inspire all men with it, and again make the world alive! James Boswell we can regard as a practical witness, or real martyr, to this high everlasting truth." Now the more hidden the hero is, the less recognized by the world, the greater is the merit of the disciple who discovers him and establishes his worship. Mr. Carlyle, we hold, exalts Boswell's merits by lowering the position which Johnson held at the time when the two first became acquainted. "At the date," he writes, "when Johnson was a poor rusty-coated scholar, dwelling in Temple Lane, and indeed throughout their whole intercourse afterwards, were there not chancellors and prime ministers enough; graceful gentlemen, the glass of fashion; honour-giving noblemen; dinner-giving rich men; renowned fire-eaters, swordsmen, gowansmen; quacks and realities of all hues—any one of whom bulked much larger in the world's eye than Johnson ever did?"

In another passage he says, "His mighty 'constellation,' or sun, round whom he, as satellite, observantly gyrated, was, for the mass of men, but a huge ill-snuffed tallow-light." Again he writes:—"Nay, it does not appear that vulgar vanity could ever have been much flattered by Boswell's relation to Johnson. Mr. Croker says, Johnson was, to the last, little regarded by the great world." Any one who should read the review without knowing the Life would certainly infer that Boswell was the first to discover to the world a great man hidden away in obscurity and poverty. Now by the year 1763, when the disciple first met his master, Johnson was at the head of the literary world. He had published *Irene, London, the Life of Savage, the Dictionary, the Vanity of Human Wishes, the Rambler, the Idler, and Rasselas*. His edition of Shakespeare he had been engaged on for some years, and he completed it two years later, before Boswell's return from the Continent. He was no longer the poor rusty-coated scholar, for the year before he had been granted to him his pension of 300*l.* a year. It was granted, it will be remembered, in the most honourable way possible, "solely as the reward of his literary merit, without any stipulation whatever, or even tacit understanding, that he should write for the Administration." Boswell's own allowance from his father was but 240*l.* a year, so that of the two men Johnson, in the early part of their acquaintance at all events, had the larger income. We have not very full information as to the society in which Johnson mixed, and the regard in which he was held before the time when Boswell made his acquaintance. But we have gathered together a few facts, which we will briefly lay before our readers.

When Boswell was only a boy of twelve years old, a gentleman of a higher lineage and an older family than he could boast of had come up to London to worship at the feet of the author of the *Rambler*. Bennet Langton, the son of the Lincolnshire squire whose "ancestor signed Magna Charta first, as Primate of all England," had, to use Mr. Carlyle's words, "been nurtured," we should imagine, "in an atmosphere of Heraldry" scarcely less than Boswell. "Mr. George Langton," Bennet Langton's son, as Mr. West tells us in his *Memorials*, "showed me his pedigree, with the names and arms of the families with which his own had intermarried; it was engrossed on a piece of parchment about ten inches broad and from twelve to fifteen feet long." "It leaves off at the reign of Queen Elizabeth," said he. "Humph! half our peerage would be proud of being able to go back even so far as Elizabeth." Bennet Langton not only visited Johnson in London, but quite early in their acquaintance invited him down to his father's Hall in Lincolnshire. Through him, too, Johnson became acquainted with Topham Beauclerk, the grandson of the Duke of St. Albans. With these two young Oxonians Johnson was living on terms of the greatest intimacy many years before he knew Boswell. Writing of the year 1752, Boswell says, "The circle of his friends at this time was extensive and various, far beyond what had been generally imagined," while Hawkins, speaking of about the same time says, "His acquaintance was sought by persons of the first eminence in literature." Men of rank were reckoned among his friends, as the Earl of Cork and Orrery and Lord Southwell. Bubb Dodington, afterwards Lord Melcombe, wrote to him to say that "if Mr. Johnson was inclined to enlarge the circle of his acquaintance, he should be glad to be admitted into the number of his friends." So early as the year 1748, in the print that is still preserved of the company which that summer visited Tunbridge Wells, we find Johnson and his wife represented, in company with Speaker Onslow, Mr. Pitt (Lord Chatham), and Mr., afterwards Lord, Lyttleton. As Mr. Croker remarks, "in that assemblage neither Johnson nor his wife exhibit an appearance of inferiority to the rest of the company." The reference to the figures, by the way, in the facsimile of the print are said to be in Richardson's own writing. How comes it then that we find Dr. and not Mr. Johnson? Johnson received his degree from Dublin in 1765, and Richardson died in 1761.

It was in the year 1755 that Lord Chesterfield by his attempts to flatter him provoked the celebrated letter. When he was accused of having treated Johnson with rudeness by keeping him waiting in his ante-chamber, he said he "would have turned off the best servant he ever had if he had known that he denied him to a man who would have been always more than welcome." In the same year Johnson received from Oxford the honorary degree of Master of Arts, while the Academy at Florence presented him with a copy of their *Vocabulario* in return for a copy of his Dictionary presented to it by "his friend the Earl of Cork and Orrery," at the same time that the French Academy sent him their *Dictionnaire*. A year or two later Smollett, writing on his behalf to Wilkes, describes him as that great Cham of literature. When his pension was granted Lord Bute behaved in the handsomest manner. In this same year Boswell says that in a trip which he took with Reynolds to Devonshire "he was entertained at the seats of several noblemen and gentlemen in the West of England." At Plymouth "the Commissioners of the Dockyard paid him the compliment of ordering the yacht to convey him and his friend to Eddystone." At Exeter, "that very eminent divine, the Rev. Zachary Mudge, Prebendary of Exeter, preached a sermon purposely that Johnson might hear him." Boswell, when he comes to the time of his own introduction to his hero, says that "Sir David Dalrymple, now one of the judges of Scotland, by the title of Lord Hailes, had contributed much to increase my high opinion of Johnson, on account of his writings, long before I attained to a personal acquaintance with him." Sir David writes to congratulate Boswell on making

Johnson's acquaintance, and says, "I envy you the free and undisguised converse with such a man." He goes on to say, "May I beg you to present my best respects to him and to assure him of the veneration which I entertain for the author of the *Rambler* and of *Rasselas*?"

On one of the early days of their acquaintance Boswell "found tall Sir Thomas Robinson (the elder brother of the first Lord Rocheby) sitting with Johnson." Boswell another day told Johnson how "Sir James Macdonald, who united the highest reputation at Eton and Oxford with the patriarchal spirit of a great Highland chieftain, had said that he had never seen Johnson, but he had a great respect for him, though at the same time it was mixed with some degree of terror." Mr. Dempster, long M.P. for Liff, "was so much struck," Boswell says writing of the same period, "even with the imperfect account I gave him of Dr. Johnson's conversation, that to his honour be it recorded, when I complained that drinking port and sitting up late with him affected my nerves for some time after, he said 'one had better be palsied at eighteen than not keep company with such a man.'" It was in the same year that the Countess de Boufflers, the acknowledged leader of French society, who was now on a round of visits in England, breakfasting with Walpole, dining with the Duke of Grafton, supping with Beauclerk, paid her visit to Johnson in Inner Temple Lane. All readers of Boswell will remember how Johnson, a moment or two after the lady had left his rooms, eager to show himself a man of gallantry, hurried down the staircase in violent agitation, and in the strangest of costumes seized her hand and conducted her to her coach. Some years before this Dr. Maxwell, the assistant preacher at the Temple, had described the levee of morning visitors that he held. "He seemed to me," he wrote, "to be considered as a kind of public oracle whom everybody thought they had a right to visit and consult. Though the most accessible and communicative man alive," he goes on to add, "yet when he suspected he was invited to be exhibited, he constantly spurned the invitation."

In 1764, the year after Boswell first met Johnson, the Club was founded. "When the Society was not more than fifteen years old," we quote from Mr. Forster's *Life of Goldsmith*, "the Bishop of St. Asaph wrote to Mr. William Jones, 'I believe Mr. Fox will allow me to say that the honour of being elected into the Turk's Head Club is not inferior to that of being the representative of Westminster or Surrey. The electors are certainly more disinterested; and I should say they were much better judges of merit, if they had not rejected Lord Camden and chosen me.'" The Bishop of Chester was black-balled on the same night as the ex-Lord Chancellor. In 1765 Johnson paid a visit to Cambridge. Mr. Turner, who twenty years later published an account of this visit, says, "I admire his prudence and good sense in not appearing that day (Sunday) at St. Mary's, to be the general gaze during the whole service. Such an appearance at such a time and place might have turned, as it were, a Christian church into an idol temple." The writer, after saying that Johnson "seemed studious to preserve a strict incognito," goes on to add, "Had he visited Cambridge at the Commencement, or on some public occasion, he would doubtless have met with the honours due to the bright luminary of a sister University; and yet even these honours, however genuine and desirable, the modesty of conscious excellence seems rather to have prompted him to avoid." In the same year "Trinity College, Dublin, surprised Johnson with a spontaneous compliment of the highest academical honour by creating him Doctor of Law." In 1767, by which year Boswell had still seen very little of Johnson, occurred the interview with the King in the library at the Queen's house. "His Majesty having been informed of his occasional visits, was pleased to signify a desire that he should be told when Dr. Johnson came next to the library. Accordingly the next time that Johnson did come, as soon as he was fairly engaged with a book, on which, while he sat by the fire, he seemed quite intent, Mr. Barnard stole round to the apartment where the King was, and in obedience to his Majesty's commands, mentioned that Dr. Johnson was then in the library. His Majesty said he was at leisure, and would go to him." In the course of the conversation that followed the King, it will be remembered, asked him if he was then writing anything. "Johnson said he thought he had already done his part as a writer. 'I should have thought so too (said the King) if you had not written so well.' Johnson observed to me upon this (writes Boswell) that 'No man could have paid a handsomer compliment, and it was fit for a King to pay. It was decisive.'"

We have shown, we think, that at the time when Boswell became intimate with Johnson the position his hero held in the world was very far from being inconsiderable. It would not be difficult to go on and upset Mr. Croker's statement, which Mr. Carlyle seems to adopt, that Johnson was to the last little regarded by the great world. In his tour to the Hebrides he was welcomed by the great people wherever there were great people to welcome him. Setting aside the Scotch judges, many of whom were men of good family and received him hospitably, and the Scottish lairds, whom Mr. Carlyle describes as the hungriest and vainest of all bipeds yet known, but who were as warm in their welcome as the judges, he was hospitably received by the Earl of Errol, the Duke of Argyll, the Earl of Loudoun, and the Countess of Eglington. "The Earl of Errol put Dr. Johnson in mind of their having dined together in London." At Inverary "the Duke placed Dr. Johnson next to him at dinner. The Duchess was very attentive to him. He talked

a great deal, and was so entertaining that Lady Betty Hamilton, after dinner, went and placed her chair close to his, leaned upon the back of it, and listened eagerly. He did not know, all the while, how much he was honoured." When the Earl of Loudoun heard that Johnson would dine with him, Boswell's servant reported that "he jumped for joy." "We were received with a most pleasing courtesy by his Lordship, and by the Countess his mother, who in her ninety-fifth year had all her faculties quite unimpaired." At the Countess of Eglington's "in the course of our conversation it came out that she was married the year before Dr. Johnson was born, upon which she graciously said to him that she might have been his mother, and that she now adopted him; and when we were going away she embraced him saying, 'My dear son, farewell.'" In London "he associated," as Boswell tells us, "with persons the most widely different in manners, abilities, rank, and accomplishments. He was at once the companion of the brilliant Colonel Forrester of the Guards, who wrote *The Politic Philosopher*, and of the awkward and uncouth Robert Levett; of Lord Thurlow and Mr. Sastres, the Italian master; and has dined one day with the beautiful, gay, and fascinating Lady Craven, and the next with good Mrs. Gardiner the tallow-chandler on Snow Hill." Mr. Fitzgerald, in his edition of Boswell, quoting from Rogers's "Table Talk," says:—"Mr. Rogers was told by Lady Lucan that her mother, Lady Spencer, used to say, 'Now, child, we have nothing to do to-night; let us bring home Dr. Johnson to dinner.'" But Bennet Langton's account of the party at Mrs. Vesey's, where the company, in which there were two duchesses, half a dozen or so of lords and ladies, whom he names, and "others of note both for their station and understanding, began to collect round Johnson till they became not less than four, if not five, deep," is in itself proof enough that Johnson was regarded by the great.

We cannot admit then the claim made for Boswell that he, and he alone, last century was a real martyr to the high everlasting truth that hero-worship lives perennially in the human bosom. If the age in which he lived was "a decrepit, death-sick era, when cant had first decisively opened her poison-breathing lips to proclaim that God-worship and Mammon-worship were one and the same, that Life was a Lie," &c. &c., it was at all events the age of Goldsmith, Burke, Reynolds, Gerald Hamilton, and the gentle Brunet Langton, each of whom rivalled Boswell in the high esteem and the deep affection which they felt for Samuel Johnson.

BICYCLING.

WE have much sympathy with people who diverge from regular habits of travel, nor is anything likely to grow more dull than tours along the well-trodden highways. Excursions in short holidays are seldom satisfactory for this very reason. We know what it is, the making points by railway, when you plunge into the hotel omnibus at the station, make a dash at supper and bed, having probably put up with a more pretence of a dinner, turn in under the oppressive sense that you are to be prematurely disturbed, and rise in the morning to rush out to galleries, churches, or scenery, having hastily disposed of a breakfast that has no time to digest. Very often the victims of swift travel can hardly help themselves. There is Hobson's choice. They have to choose between hurrying over their ground and renouncing change of scene altogether, and possibly they act wisely on the whole in going in for a scramble. The spirits are elated, the nerves are braced, even if there is a somewhat injurious strain on the strength and the stomach. But sensible people even of the most energetic temperaments are inclined to revolt against this perpetual hurry and scurry. They have a liking for labour in its proper place, and their ideal of a thoroughly enjoyable holiday is anything but lotus-eating lying on the back. They have no wish to coddle themselves, and the consciousness of severe effort well sustained imparts fresh elasticity to all the springs of their nature. But, as they must inevitably revert to the everyday tenor of their lives, they desire that their holiday shall be something more than mere hard work. Their great object in taking it is to secure independence of action, and consequently pedestrianism is much in favour with them. It has its drawbacks of course. The pedestrian may need but little of a wardrobe here below, but something in that way he does want. At the least he must carry a change of the raiment that is not covered by his waterproof, with shifts of underclothing and some indispensable necessaries of the toilet. If he does not intend that his mind shall lie utterly fallow, he must have a book or two for company in an evening. In fact, however rigidly he may restrict his preparations, when he comes to make up his knapsack he finds that its contents will run to a good many pounds weight. It contains a considerable part of the furniture of his shifting home, the most essential comforts of his moveable base of operations; and if he wishes to travel with an easy mind, he will not lightly lose sight of it for a moment. But a dull or obtrusive companion is worse than none at all, and the embarrassing company of a guide or porter may spoil the enjoyment of a day. So that the pedestrian's knapsack is apt to sit to his shoulders like Sindbad's old man of the sea. As Murray points out very justly in his observations on Swiss walking, that knapsack frets your spirits, however strong may be your body. It tells on your springy step as you set yourself to pull up one piece of rising ground after another, in the invigorating mountain air and in the midst of inspiring scenery. It weighs irresistibly in the

balance when your mind is fluctuating as to whether that famous waterfall or marvellous glacier is really worth disengaging to. With the sun so hot and the flooded path so heavy, you decide for the lazier side of the argument, and continue on the shorter course with a reproving conscience, to be told infallibly in conversation at the *table-d'hôte* that you have missed the grand attraction of the neighbourhood. Consequently pedestrianism has been abandoned by many people who seemed specially made by nature to enjoy it; and men who will go through the roughest day's shooting, and like it, have fallen back, greatly against their will, on the irritating inactivity of chaises and dogcarts, of diligences and *einepänner*.

To many of these men the introduction of bicycles appeared to offer an agreeable alternative. The novel vehicle left them absolute masters of their movements, and it still exercised their legs while saving their resentful shoulders. Then it helped them to cover great distances, carrying them swiftly over long stretches of flat, where all was dull, if not barren. It imparted that animating sense of motion which the great lexicographer enjoyed so thoroughly even when experienced in the tamer movement of a postchaise. In the way of exercise it left nothing to desire, and there was the exciting chance of an occasional accident. It was urged besides that you could carry your baggage along with you without very seriously adding to your exertions; and then the preliminary practice of the art was cheered with the bright expectation of turning it some day to the cherished purpose of a tour. So, on the whole, we cannot wonder that bicycling has become popular, or that the numerous Bicycle Clubs have made so satisfactory a start. Yet we confess to being somewhat surprised at the enthusiasm which follows up the pursuit in the shortening days, and promises to carry it on through the rigours and disagreeables of an English winter. Summer excursions were obviously all very well. When a flying party made something like a time race of it down to John o'Groats' House, even non-bicyclers must have followed them with a certain sympathy. We hold that, for busy people, the object of improving a holiday should be entirely subordinated to that of enjoying it, and, as an Alpine Club man may do wisely and well in making a rush up the sides of Mont Blanc instead of dallying with the views at the Glacier des Bossons, so these bicycling enthusiasts may have made the most of life in rushing past English cathedrals and Border battlefields, Highland hills, heaths, and estuaries. They had long and fairly warm days, if they could not count upon favourable weather. Though the pace was good, they saw something of the country, for the light lasted through the longest working day, even before they attained to high Northern latitudes. The roads, too, were in excellent condition, and the travellers could generally go at their best pace, like horses galloping on smooth training ground. But we should have fancied that bicycles would go out of season just about the time when hunters are brought out, and that their owners would pass the dark days of the winter between the pleasures of memory and of hope.

If we thought so, it would seem that we were quite mistaken. As a matter of fact, the Bicycle Clubs appear to be almost as active as ever, although perhaps they do not push their expeditions quite so far. Scarcely a week goes by without the chronicle of some flying trip appearing in the columns of our sporting contemporaries. There are also perpetual inquiries as to the character of counties and the condition of roads, showing that a number of adventurous spirits contemplate venting their superfluous vigour in winter bicycling. There is no disputing about tastes, and of course, if the bicyclers like it, there is little to be said except that their following their pursuit in winter is a taste which it is hard to understand. A strong man battling with obstacles and defying disagreeables may be a sight for the gods, and from this point of view we are inclined to admire, although we cannot possibly sympathize. The reports of returned bicyclers sing psalms of victory over adverse circumstances. They are as heavily charged with accidents and *contretemps* as narratives of discovery in Central Africa. For it is to be remembered that the heroes of these exploits look upon time as their natural enemy; if they were content to take things more easily, and to practise patience of an evening in dull coffee-rooms, we could better understand the attractions of their journeys. They are brought to a standstill neither by night nor tempest; very often they are shot out of their saddles in spite of heroic efforts to stick to them, and are reduced to wheeling their machines uphill by hand. One gentleman tells how he set out in drenching rain after an early breakfast, finding the roads, as might be expected, terribly heavy going. Arriving late at his midday destination, he dwells with naturalunction on the luxury of a glowing fire and a luncheon of hot chops. No rest for the bicyclist, however, any more than for the wicked. Having laid in his supplies, he is off again, although the remorseless weather declines to hold up. His troubles are only beginning, too; for he finds himself landed in a hill country, and as a pioneer of enterprise he warns any bicyclers who may follow him that the scenery he saw through mist and rain scarcely repaid him for his violent exertions; and he suggests that it might be well to study county maps in order that the flanks of these hills should be turned. Soaked a second time, he comes in for tea; and we may remark by the way that a regular dinner seems to be a negative feature in these trips. It may be prudent perhaps not to overcharge the digestive organs, and when mental anxiety has to be faced as well as physical exertion, it may be well to work along on light meals laid in at moderate intervals. For even the evening tea does not bring the labours of the day to a close. The ham and eggs

despatched, the bicycle is ordered round again, and we must say that this evening start in the dark says much for the iron nerve of the traveller. It must demand about as much resolution as getting up in the small hours for a start on a spring Arctic sleighing party over hidden hummocks of ice and half-frozen floes. You make your way through the dark in momentary apprehension of a catastrophe. Balancing oneself on a bicycle is a delicate business at best, when the pace is quick and the light uncertain. But all the faculties must be kept painfully on the stretch when you have not the faintest suspicion of what lies before you. You may assume that there is a ditch on either hand, although often the limits of your road lose themselves altogether in vague uncertainty. Now and again at this season you are sure to find yourself labouring among layers of loose stones; but that is comparatively unimportant in the end, although it drives you to dismount and plod along on foot. The real danger is where the road has not been repaired. To go ahead at all, you are bound to keep going at a certain rate. Here the wheel jolts on a stone, and while it is swaying about to recover its equilibrium, it catches awkwardly in another; and then again it locks fast in a rut, and over you go. You are lucky if you disentangle your ankle from crank and wheels, but we know that there is a special providence that watches over the foolhardy. In any case you come down, either soft or hard. If you fall hard, you gather yourself up bruised and scratched; if you fall soft, you carry away a sample of the soil of the road; and it must be remembered that your travelling wardrobe is necessarily scanty in the extreme. Assuredly you have worked for your bed by the time you reach it with abraded skin and aching bones.

On the whole, then, these bicycling tours seem made for men in the first freshness of their exuberant physical force. Even in summer they involve more roughing it than most men of middle age can enjoy. Yet undoubtedly they offer the charm of a very independent means of conveyance that takes one easily over a great deal of ground. For ourselves, we should be content to diminish the pace, even if we considerably increased the exertion, and, looking forward to halts and comfortable arrangements for the night, we should gladly compound for carrying some extra luggage. The necessity too for a course of perpetual gymnastics is alarming to men who have lost something of their agility, and who have families at home dependent on their exertions. What we should like to see is an improved form of tricycle, on which one could sit with reasonable comfort and yet travel with tolerable speed. We believe that experts pronounce such a combination to be perfectly practicable, although as yet it has not been attained, and we trust that they may turn their attention to it in earnest. The fashion hitherto has been all for bicycles, and yet we suspect, if we may venture on an Irishism, that a tricycle is the true bicycling carriage of the future.

CHAFFWAX AND CO.

THE existing Courts of Law and Equity will shortly become branches of one High Court, and it seems to follow that the offices of these courts will be to some extent amalgamated. In order to prepare the way for the full and beneficial operation of the Judicature Act of 1873, a Commission was appointed to inquire into the Administrative Departments of the Courts of Justice; and this Commission has made two Reports, of which the historical as well as practical interest can hardly be exaggerated. It would be surprising to any one unacquainted with the subject to observe how inveterate during centuries was the habit of administering the law for the benefit of the Administrative Departments. The Lord Chancellor or Lord Chief Justice conferred offices on his friends, who appointed deputies to do the work if there was any, and these again appointed deputies, and the object throughout this hierarchy seems to have been to do as little and get as much for it as possible. Even now the tradition of "little to do and plenty to get" so far lingers in those offices that many of the clerks have easier places than the ordinary Civil servants of the Crown. One change which has taken place within the last forty years indicates clearly how the habits of London lawyers have been affected by the general migration for domestic purposes of London into the country. Formerly all these offices were open in the evening, and the solicitors' and barristers' chambers and even some of the Courts were open also. In the days when legal dignitaries lived in Lincoln's Inn Fields and Bedford Row, and the profession generally clustered around them, this practice was convenient. Consultations were habitually held in the evening, and arbitrations in which counsel were engaged proceeded in the evenings at the Crown and Anchor Tavern in the Strand. The custom of holding the Old Bailey Sessions after dinner was more honoured in the breach than the observance. The things that were done then cannot be undone, and had better be forgotten. Sir William Grant sat at the Rolls after dinner, and tradition says that he mitigated the dryness of legal argument with old Madeira; but it has never been suggested that his character of "equity reserved" was at all affected by his potations. Either as a cause or consequence of the late habits of London lawyers, the mails were not sent out from London until nearly midnight.

It must not be supposed that either complaints against abuses or attempts to remedy them are exclusively products of our own time. A Commission was appointed in 1732 to inquire into offices and fees in all the Courts, and they exposed, and to some extent mitigated, the system of exactions under which suitors at that time

suffered. Thus the fee on a warrant to attend a Master in Chancery was two shillings, but three successive warrants always issued to one effectual attendance. It is fair to say that at this time the salaries and lawful fees of the Masters were inadequate, and the methods which they adopted to obtain indirect remuneration had become almost consecrated by antiquity. The proceedings in a Chancery suit were in large part conducted in the Master's office; they were chiefly in writing, and of great length, and all parties had to "take copies." The same system prevailed as far as possible in the other offices of the Court, and it is not surprising that the solicitors imitated such a respectable example in their own practice. An explanation is thus afforded of that almost ineradicable tendency of our law to verbiage which satirists and philosophers have so often and so vainly assailed. A Report of the Commissioners of 1732 mentions the grievance involved in the unnecessary length of recitals in orders, and in insisting, under an order made in the 4th and 5th Philip and Mary, that parties requiring copies of depositions before the Examiner should take also copies of their own interrogatories, which they did not require. It is interesting to know that in an age which we are apt to regard as principally occupied with burning heretics the officers of the Court of Chancery were engaged in manufacturing a large supply of waste paper. "The practice of putting six words in a line, and fifteen lines in a sheet, and charging at per sheet," is also said to have been exposed and condemned by these Commissioners. But here perhaps their meaning has been misunderstood. This practice prevailed down to the reign of the present Queen, but the object of it was to enable the number of folios of 90 words each in a copy to be readily counted. The charge of 1s. per folio for copying was a high charge, and was no doubt fixed to allow a profit to the office according to the inveterate habit of indirect remuneration for legal work. There was, however, a further refinement in execution, which consisted in writing dates and sums in words at length, in order to get the fullest number of folios out of a copy. The Commissioners remarked, as they justly might, that this practice when applied to an account rendered it unintelligible. It was afterwards so far mitigated that the clerks only charged for words at length, but did not insist on writing them. Thus the current year, if it occurred in an answer in Chancery, would be copied in figures in one of the spaces usually occupied by a word, and the next six spaces would be left blank. The copies thus made, with only ninety words not particularly well written on a page, were exactly the reverse of what the eye requires for rapid reading. And accordingly when the copy was obtained from the office, the first step was to make what was called a "bird copy" for counsel, for which the solicitor was allowed to charge 4d. per folio to his client, and of course made a profit on the charge. It is needless to say that clerks brought up in this cumbrous and absurd system regarded the introduction of printed bills and answers as a rash and ruinous innovation.

We have, however, seen and survived this change; and we are encouraged therefore to suggest another change, and, by way of introducing it, we will, at the risk of being accused of profanity, ask the question what is the use of the Great Seal? Of course it is useful to some dealer who makes a profit on the four cwt. of wax which it consumes per month, but it is a cumbrous and otherwise useless relic of a barbarous age. The seal is now affixed by the "Purse Bearer" of the Lord Chancellor, who, besides the work of his own rather mysterious office, does the work formerly discharged by "the Sealer and Deputy Sealer, the Chaffwax and Deputy Chaffwax," receiving 100*l.* a year in addition to his proper salary of 500*l.* a year, and paying 30*l.* a year out of his own pocket to a porter to help him. The Commissioners who have lately reported on these and other offices do not explain whether the Great Seal is put into the purse; but they state that the duties of the Purse Bearer are chiefly ceremonial, and might be done, as the holder of the office candidly admits, by another officer, called the Gentleman of the Chamber. The Porter to the Great Seal has actual charge of the seal during the day, and he assists the Purse Bearer in using it, and keeps in store the wax on which it is impressed. We fear that the utilitarian spirit which has abolished Chaffwax and Deputy Chaffwax will ere long call in question the necessity of the article to which they owed their names. It might be a curious question how many letters passing through the Post Office are sealed with wax, and how many of these at the expense of those who write them. Sealing letters is however merely troublesome to the sender, whereas the Great Seal impressed on a cake of wax carried in a tin box is a nuisance to everybody who has to do with it. There is of course somebody who supplies these tin boxes, and has, like the purveyor of wax, an interest in the perpetuation of the present "cumbrous method" of passing documents under the Great Seal. There is another officer of the Lord Chancellor, the Train Bearer, whom the Commissioners consider "evidently necessary," and we must allow that they are right, unless we are prepared to question the necessity of trains, which we could hardly do without opening the door to doubt as to the utility of wigs, full-bottomed or other, and so to a variety of questions more easily asked than answered.

The idea of our forefathers as to law and other public offices seems to have been that a privileged class was entitled to get as much out of them as possible, and, subject to that condition, they were to be adapted to general convenience. Thus at the beginning of this century there was a Board of Taxes, a Board of Stamps, and a Board of Excise, and we all know the sort of Commis-

sioner that sat at those Boards. He was well born, at least on the father's side, well dressed, gentlemanly, and fairly educated, and he attended at the office and signed his name as much as was consistent with his duties to society. Now one Board does the work of all these three Boards, and we fear that the members of this Board have lost much of the ornamental character of the Commissioners of sixty years ago. The spirit which multiplied these offices may be called, for want of a better word, nepotism; but it must be understood that this was not the narrow spirit which would "take care of Dowb" individually, but a broad purpose of providing at the national expense for the entire class to which "Dowb" belonged. It was in this spirit that the office of Comptroller of the Seal of the Courts of King's Bench and Common Pleas was granted by letters patent under the Great Seal of King Charles II. to the Duke of Grafton in tail-male. About the same time the office of Custos Brevium of the Court of Common Pleas was, after the determination of several lives then subsisting, granted in trust for the Earl and Countess of Lichfield, and for the issue of the Countess in tail. These offices were in the memory of this generation held under the patents of King Charles II. They had become largely profitable, they were exercised by deputy, and were fruitful sources of delay and expense to suitors. No real reform of procedure could be attempted without abolishing them, which was accordingly done by Parliament providing compensation to the holders. A somewhat similar case is that of the Registrars in Chancery, who were till 1833 merely deputies of an officer who never acted. The patent of Registrar was in 1727 made out in the names of trustees for the Duke of St. Albans, and it may be remarked that this dukedom, like that of Grafton, has a Caroline origin.

It must not, however, be supposed that there is not much hard work well done in the present Administrative Departments of the Courts. The Commissioners truly say that the Chief Clerks to the Judges in Chancery "are among the hardest-worked men in the State service," and because they do their work well it is constantly increasing. The Masters of the Common Law Courts perform somewhat similar duties, but have a higher status, as they are independent officers and not mere clerks. These duties are likely to increase, because there are a vast number of cases of account unsuitable for trial by jury which must be dealt with either by such an officer as the Master or by a private arbitrator. The more the legal machine is improved, the more work there will be for it to do, and the holders of these offices would in general greatly prefer to be fully employed. It need not, therefore, be supposed that such arrangements as the Commissioners suggest would be distasteful to existing officers, and, speaking generally, these arrangements would be beneficial to the public.

A PAIR OF FABLES.

THOSE who did not read the *Daily Telegraph* of last Wednesday have lost a treat. It recorded "a simple act of bravery" in an article of most elaborate construction. The hero of the story, Matthew Scott, belongs to the same mythical class as the famous Brumby; but the latter only fought a dog, whereas the former conquered a rhinoceros. By saying that these personages are mythical, we do not mean to suggest that they do not exist, but only that their deeds have been made the subject of romance. We can believe that the hillocks of the Troad contain the ashes of heroes, and yet we need not believe all the fables that have been written about Achilles. Matthew Scott is perhaps "a plain straightforward man," and is certainly an assistant-keeper at the Zoological Gardens; and it is written in the glorious page of fiction that, in attempting to save two comrades from a horrible death, he risked his own life without a moment's doubt against such terrible odds as might make the boldest man alive think twice before encountering them. In fact, Scott by some neglect exposed two other keepers to be assaulted by a rhinoceros, and if he went promptly to their aid, he did no more than his duty. The *Daily Telegraph* happens to know, or at least is able to state, that this rhinoceros has for years been waiting for a chance to kill his keeper. On Saturday morning the chance nearly came. The brute was in his paddock, and two keepers were cleaning out his cage. "There was a quick, sharp snort; the very earth shook with the swift, heavy rush of the furious brute," and, to put it shortly, he knocked down the men and jumped upon them. We feel some compunction in stripping this narrative of its embroidery, but it is necessary to observe that the earth-shaking is an embellishment of the same class as that which we adopt when we ascribe thunder to Jupiter Junior in Fleet Street. The animal was cunning enough to make a "noiseless rush" back into his house, and the knocking down, tossing, and pounding are equally imaginary with the earth-shaking. "Sore peril indeed was that in which these two men lay." We are almost tempted to quote *Hamlet*, and say the peril was theirs, for they did lie in it; but that would be hard on the two men, who very likely are incapable of romancing, and are not responsible for having attracted the notice of the epic muse. In a few seconds they would have been crushed and mangled out of all shape of life, but in fact they got behind an iron screen, and in fiction the valiant Scott, armed with Carter's whip, came to save them. We will not follow the fables in the inquiry what Scott thought about at this moment. Perhaps he did not think at all, not being paid to do so. However fortune favoured the brave, and he hit the animal in

the eye with the butt-end of the whip, and the animal did not like it. Scott drove him into the paddock, and picked up his damaged comrades, and was putting them behind the screen when the animal charged again and was again beaten off. A third charge was made and repulsed, and finally Scott lifted his comrades successively through the bars of the cage into complete safety. This is the substance of a highly ornamental narrative, of which, as we learn from good authority, scarcely any material part is true. The men were not knocked down, and therefore Scott did not pick them up. They rushed at the same moment to the screen, and it was almost literally "fastest first and devil take the hindmost"; for one of them was badly bruised. But there was no fainting, no falling, and neither blood nor foam dripping from the beast's jaws. One of the men is said to have been "so terribly bruised and battered" that it was impossible to tell, poetically, what injuries he might not have received; but Mr. F. Buckland, surgeon and naturalist, is able to state that he had no bones broken and no wound. The other man had the flesh torn off his right leg in a "ghastly wound" which has been seen only by the narrator's imagination. To Mr. Buckland's eye the man's leg was severely bruised and swollen. This "simple recital of facts," as the *Daily Telegraph* is pleased to call its article, concludes with the remark that men such as Scott do not calculate chances:—"It was enough for him that he saw the brute dashing his comrades about as they lay under his feet." But he did not see this; because it did not happen. He saw the brute dashing a watering-pot about as it lay under his feet, and this utensil was "so terribly bruised and battered" that its oldest friend would not know it. It is, however, true that there was "no Victoria Cross for Scott to win," nor was there any "encouraging shout" during the combat, although there has been enough noise made about it afterwards.

It is difficult not to suspect that some of the more extravagant compositions of the *Daily Telegraph* may be inspired by ambition to rival those magnificent embroideries of fiction upon fact which are regularly supplied to the readers of the *New York Herald*. Just before our English muse felt called to sing the praise of Scott, it had occurred to that enterprising journal to publish an account, not of an onslaught of one fierce animal on his keepers, but of the rush of an entire menagerie from its dens, and of the flight and slaughter of the population of New York. As in England, a rhinoceros began the row, but it went immeasurably further, at least in fiction; and it is another coincidence that a keeper poked the creature in the eye, but without the happy result that ensued here, and, indeed, with a result very much the reverse of happy. The rhinoceros, mad with pain and rage, knocked away the bars of his own cage, and then rushed about the place and smashed all the other cages, and let the animals loose upon New York. We can imagine that if the recent explosion had been rather stronger in the Regent's Park, the dens and cages of the Zoological Gardens might have been smashed and the animals turned loose upon society. A news-vender's boy supplying early copies of the *Daily Telegraph* might have been swallowed by a lion, and the only hope of arresting his further ravages would have been that the boy's boots or the leading articles might disagree with him. A member of the Shoeblack Brigade might have been bolted, with his blacking and brushes, and the shoes he was cleaning, by a tiger. Snakes might have enrolled themselves in Chancery, and apes might have endeavoured to pass for actors at the theatres. The soldiers would have been called in aid of the police; all would have been supplied with revolvers, and in random firing at the wild beasts they would have killed more people than these wild beasts slew. All this and much more might have happened, or the *Daily Telegraph* might have told us that it had happened, in London. The *Herald* tells us that it has happened in New York, and as a hero is necessary for every romance, the Transatlantic fabulist has chosen Governor Dix. The Bengal tiger having counted up a score of victims, surrendered his life to the trusty rifle of the aged Governor, who shot him as he rounded Madison Avenue. This was an extremely fortunate occurrence. The Governor, a splendid shot, was in town in the nick of time, and his gallant act will be remembered by the citizens of New York, although it is now too late to mark their esteem at the ballot-box. There is a wonderful similarity between these reflections and those which the *Daily Telegraph* makes upon the conduct of Matthew Scott, who, "being by no means a strong or powerful man," and having no hope of the Victoria Cross, did battle with a rhinoceros. If we desired a third parallel, we must seek it in the *School for Scandal*, where the gossip-mongers recount the imaginary circumstances of a supposed duel. We had almost forgotten to mention that Archbishop McCloskey's carriage drove up a minute after Governor Dix had shot the tiger, and it was considered a providential circumstance that the horses escaped fright, which might have seriously affected the health of the aged prelate. The rhinoceros who set the game a-going ended his own part of it ignominiously by tumbling into a sewer. But he had previously given a nervous shock to a girl subject to heart-disease, and her death might be looked for at any moment. He also gored a milkman's horse, smashed a shanty where the inmates were at supper, and knocked the planks of it into the fire. All the family, however, escaped, except the baby, who was burned to a crisp. Such were the feats of the rhinoceros before he died, if dead he be, and not burrowing with his "double-horned head" among the sewers of New York, and preparing fresh calamities for that unhappy city. The rhinoceros has been so malevolently active on both sides of the ocean that we feel by no means sure that he may not break out in a fresh place.

The *Herald* no doubt regards this gigantic "sell" complacently. It is headed "Awful Calamity," occupies a full page of six columns, and quite at the end we are informed that "the entire story is a pure fabrication." We would venture to suggest both to American and English editors of sensational newspapers that, if there is any statement which they desire readers to believe, it would be convenient to distinguish it by peculiar type or otherwise. One artist takes a story as he picked it up with many exaggerations at the Zoological Gardens, dresses it neatly as a paragraph, and sends it to the *Daily Telegraph*. A superior artist takes this paragraph and converts it into a leading article by the process of telling the story over again with such embellishments as his taste and fancy may suggest to him. Thus "the jaws dripping with blood and foam" are ascribed to the rhinoceros merely as being the proper thing on such an occasion, and as suggesting to the reader's mind—what would have needed extreme audacity to state—that the blood was that of the two prostrated and pounded keepers. It is scarcely necessary to remark that the animal could get no blood out of a watering-pot, although it might have got blood out of him. Titus Oates offered to tell a pretty fable in the witness-box, and the Judge expressed the hope that it might be the first and last he might utter from that place. It were to be wished that editors of newspapers, if they cannot abstain from fabling in their articles, would at least indicate the point where news ceases and romance begins.

REVIEWS.

LORD DALLING ON SIR ROBERT PEELE.*

IT is to be regretted that Lord Dalling's premature death prevented him from continuing his series of Historical Characters. Natural taste, study, and familiarity with French conversation and literature, had impressed upon him the importance and value of style. His publisher, Mr. Bentley, says that Lord Dalling sometimes caused whole pages, after being set up, to be printed again and again, and that "he would spend a morning sometimes in giving more finish to the style of a few paragraphs." His language is consequently lucid, concise, and sometimes epigrammatic; and occasional solecisms may probably be attributed to long residence abroad. The barbarous phrase "a large mass of uncertainties" may be explained, though not excused, by the unconscious adoption of a French idiom. The statement that "the general tendency of many minds is to refuse one order of ability where they admit another" would be not less feeble and confused in a French version than in English. There is perhaps something of the quality which the French call logic in the reference of Peel's acts and motives to a general theory. It was undoubtedly true that Peel "took up this thing or that, and carried it, if it were good, when it could be carried." It may also be admitted that "he did not say that it was good before opinion was prepared for its being carried"; but it should be added that in some cases he said that a measure was bad, and nevertheless afterwards carried it. Few political characters have been more consistent than that of Peel, although he began his career as a supporter of Lord Eldon, and finished it as an advocate of religious equality, and as the principal promoter of Free-trade; but the most regular and uniform biography is more various and more instructive than any verbal generalization. Macaulay would have described the character of Peel by saying that he was the stiffest, the driest, the narrowest, and the least sympathetic of statesmen; and yet that, "such is the inconsistency of human nature," his opinions were singularly elastic, that he took comprehensive views of the public interest, and that he gave practical effect to the enthusiastic desire of improvement which he shared with the best politicians of his time. Lord Dalling is less paradoxical, and his summary of the history of Peel is as sound as a condensed account of a complicated character and its results can be. He satisfied his sense of literary fitness by dividing his narrative into six parts, which correspond with sufficient propriety to as many stages in Peel's political life. In a prefatory notice Lord Dalling admits that he has nothing very new to say; and it is difficult to understand why he has not inserted facts and anecdotes which may probably have been within his knowledge. In the posthumous volume of the Life of Lord Palmerston, Lord Dalling attributes the rupture of 1846 between Sir Robert Peel and Lord Stanley to personal grounds of offence arising from Peel's excessive susceptibility to unseasonable banter. The statement would have been more suitable to the present work; and perhaps, if it had been fuller, the relation of cause and effect would have seemed more adequate and less apocryphal. It is difficult to explain the secession of Stanley by the irritation which may have been felt by Peel. In dealing with another subject, Lord Dalling supplies an interesting comment on an angry and unjust attack on Mr. Ellice, contained in a letter of Lord Palmerston's which is published by Lord Dalling himself or by the editor of his papers. Lord Dalling assigns to Mr. Ellice a considerable share in the successful promotion of the Reform Bill. "There happened at the moment of which I am speaking to be a man connected with the Whig Government who by his frank, good-natured manner, his knowledge of human nature, his habits

of business, his general acquaintance with all classes of persons, and his untiring activity, gave an intensity and direction to the general sentiment which it would not otherwise have attained. I allude to Mr. Edward Ellice, Secretary of the Treasury." Mr. Ellice at that time acquired an influence over the press which he perhaps afterwards exaggerated in his recollections. He was especially proud of having invented the cry of "The Bill, the whole Bill, and nothing but the Bill," which undoubtedly served the purpose of the Government by checking internal dissensions among the party.

The external conditions of Peel's career were in the highest degree advantageous. His family, though it had but recently acquired great wealth, had for many generations owned a small landed estate, which still testifies to their ancient descent by its name of Peel's Fold. The Minister's great ability was, as in the case of almost all eminent men, hereditary in the male line of descent. His grandfather had raised himself from the rank of a yeoman by becoming a thriving manufacturer. His father, the first baronet, after amassing a large fortune by his enterprise and vigour, acquired a considerable position in the House of Commons. His avowed intention of training his eldest son to be Prime Minister had, in Lord Dalling's opinion, some effect in the ultimate realization of his hopes. The elder Sir Robert, after opposing his son's Bill for the resumption of specie payments, lived to see him the second Minister in the Duke of Wellington's Cabinet, and afterwards the undisputed leader of the House of Commons, and the destined head of any Conservative Government which might be formed. After attaining high academical distinction at Eton and Oxford, Peel became in his earliest youth Private Secretary to Lord Liverpool, Under-Secretary of the Colonies, and, at the age of twenty-four, Secretary to the Lord-Lieutenant of Ireland. As he was opposed to the Catholic claims, he was described with short-sighted facetiousness by the nickname of "Orange Peel"; but Lord Dalling rightly calls attention to the significance of his first speech against Catholic Emancipation. His argument was in substance that, if the Catholics were admitted to equal rights, they would use their numerical superiority to destroy Protestant ascendancy and the Protestant Church. At that time, and long afterwards, Liberal politicians were in the habit of arguing that the Catholics would loyally accept the established institutions which the English nation then considered indispensable. Whigs of the acute but not profound order to which Sydney Smith belonged were sincerely convinced that Catholic belief was only retained as a point of honour, being too obviously absurd to survive the relaxing influence of toleration and justice. If the general assumption of the necessity of maintaining Protestant institutions had been well founded, Peel's inferences would have been sounder than the argument for emancipation; but political wisdom is tested by a higher standard than that of forensic triumph. In substance Peel contended that a large population should suffer injustice for the benefit of a minority. Long afterwards he conceded the Catholic claims with tardy resipiscence, on the sufficient and not inconsistent ground that the minority itself would be endangered by further resistance. In 1809 Sir Arthur Wellesley, then Irish Secretary, entered, as appears from his published despatches, with characteristic simplicity and unity of purpose into the jobbing distribution of patronage by which the Government was carried on. In a letter addressed to the local Government agent at Cashel he directed him to return for the borough a Mr. Peel, whose Christian name he had not yet ascertained. Three or four years later Mr. Peel first exhibited in the same office his great administrative ability by organizing the admirable police force of which, both in Ireland and in England, the name is associated in popular language with its founder. The common delusion that legislation is the chief business of a Minister derives no countenance from the example of the statesman who was both the best administrator and the most successful legislator of his time. It is true that the institution of an efficient police in England and Ireland, the reform of the criminal law, the reconstruction of the tariff and the establishment of a sound system of finance, required the formal assent of Parliament, but they were essentially applications of the art of executive government. "With a reputation increasing yearly in weight and confidence, he resigned his post (of Irish Secretary), and escaped from a scene the irrational and outrageous contentions of which were out of harmony with his character." Peel had entered sufficiently into the spirit of Irish society to challenge O'Connell; and among companions with whom he was at his ease he delighted during the remainder of his life to tell amusing or extravagant Irish stories. It is probable that his pride and his shyness may have prevented him from acquiring social popularity in Ireland, nor indeed did he elsewhere at any time attain it, except in circumstances of perfect intimacy. In 1819, after his return from Ireland, he was selected by the Government as Chairman of the Bank Committee, and, as the result of the consequent inquiry, he carried the Bill for the resumption of cash payments which earned for him Oobbett's nickname of "Peel's Bill Peel." He was fortunate in remaining out of office during the Queen's trial. His administration of the Home-Office, where he soon after succeeded Lord Sidmouth, confirmed and extended the solid reputation which he had already acquired. On the death of Lord Liverpool, he naturally adhered to the section of the Tory party which followed the Duke of Wellington. Notwithstanding the malignant charges which were trumped up against him twenty years afterwards by Lord George Bentinck, there is no reason to suppose that the conduct of Peel was disapproved by Canning himself, and during the short remainder of Canning's life they

* *Sir Robert Peel: a Historical Sketch.* By Henry Lord Dalling and Dalwe. London: Richard Bentley & Son. 1874.

continued on friendly terms. In a letter in which he expresses deep regret at Peel's resignation, Canning adds that "the frankness and generosity with which you have defined and limited the motives that dictate your retirement afford to my regret all the alleviation of which it is susceptible." From some passages in Peel's correspondence with the Duke of Wellington, it appears that they both agreed in imputing to Canning a tendency to intrigue which can scarcely have been imaginary. It is certain that Canning had no wish to keep the Duke of Wellington in office; and though, according to Mr. Greville, he entertained a personal dislike of Huskisson, he may perhaps on political grounds have preferred him as a lieutenant to Peel. The Catholic question, which was the sole ostensible pretext for the schism, was only one of many causes which rendered it inevitable.

No part of recent history has been recorded in greater detail than the events which preceded the determination of the Government to emancipate the Catholics. The first definite proposal of a Bill was addressed by Peel to the Duke of Wellington in the summer of 1828; but there is no doubt that the Duke had already resolved on a policy of concession. It was only on the urgent representation of the Prime Minister that Peel consented to remain in office; indeed, as early as 1825 he had meditated retirement both from office and from Parliament, that he might not be a party to a change which he began to recognize as inevitable. His final determination to share the obloquy which awaited the converted anti-Catholics was an heroic act of self-denial. As he had probably foreseen, the vituperation of his former followers was mainly directed against himself. The Duke of Wellington's character and great reputation raised him above calumny, except of a partially flattering kind. The firmness with which he controlled the House of Lords and overruled the vacillation of the King commanded respect even where it caused irritation. Nearly all the Tory peers to whom he addressed himself eagerly promised their support on all other questions, even where they had scruples in repudiating all their former opinions. The Duke was denounced as a tyrant, a dictator, and even as a dangerous conspirator; but the baseless charge of treachery was reserved for Peel. Many of the Duke's assailants were silenced by his duel with Lord Winchelsea, and on the whole he issued from the struggle with undiminished power. Peel lost his seat for Oxford, and the confidence of the Tory party; and the Whigs at that time and long afterwards failed to appreciate the Liberal tendencies of his character and intellect. It is possible that a sense of injustice, though it was inflicted by others, may have caused the coldness which is known by sufficient testimony to have existed for some years afterwards between the two great Tory leaders. Lord Dalling states, probably on the authority of Peel himself, that he disapproved of the Duke's declaration against Reform; and he stood aloof from the obstinate resistance which was offered by the Duke of Wellington and Lord Lyndhurst to the Reform Bill in the House of Lords. In 1832 he saved his former colleague from a hopeless enterprise by refusing to take office on the resignation of Lord Grey. Eighteen months afterwards it was on the Duke's recommendation that William IV. entrusted Peel with the formation of a Ministry. His short tenure of office in 1834 and 1835 convinced the country that he had no equal as an administrator and as leader of a party. Lord Dalling, who as a Whig member took part in an opposition which he abstains from designating as factious, says, "But let us be just. Never did a statesman enter office more triumphantly than Sir Robert Peel left it. His self-confidence, his tact, his general knowledge, his temper filled even his opponents with admiration." It may be remembered that at this time he had almost overcome the cynical distrust with which Mr. Greville regarded all the statesmen of his time. Sir Robert Peel's conduct of the opposition to Lord Melbourne from 1835 to 1841 is passed over lightly by his biographer. It is remarkable that neither Lord Dalling nor Mr. Greville in the published portion of his Memoirs refers to the intrigues which Lord Lyndhurst in those years undoubtedly carried on for the purpose of supplanting Peel. Lord Lyndhurst's satellites whispered that Peel was unsound in his principles, and they talked of their patron as Prime Minister, with Follett as leader of the party in the House of Commons. It is believed that Lord Lyndhurst discerned Mr. Disraeli's aptitude for political combinations; and he may have hoped to gain adherents of more established reputation. The design was utterly chimerical; and it was, fortunately for himself, abandoned by its author in time for him to share in Peel's ultimate triumph.

The great commercial and financial measures of 1842 and 1844, feebly opposed by Lord John Russell and the Whig party, increased Peel's claim to the confidence of the country. In 1845 he offended the Protestant bigots by his Bill for increasing the grant to Maynooth, and for withdrawing it from annual discussion by charging it on the Consolidated Fund. Mr. Disraeli then commenced his brilliant Parliamentary career by invectives and epigrams directed against a policy of which it is difficult to believe that he disapproved. Mischievous Tories applauded their new champion with enthusiasm; and the Opposition, while they supported the Bill, took no pains to conceal their delight at the pain which was inflicted on their great antagonist. The gratification which had been afforded during the Maynooth debates to the false friends and ambitious enemies of the Minister designated Mr. Disraeli in the next Session for the easier task of denouncing Sir Robert Peel's conversion to the cause of Corn-law Repeal. Without his aid the indignant Protectionists would have

perhaps sulkily acquiesced in their disappointment; but they found a mouthpiece in Mr. Disraeli, who in turn, not having himself attained the rank of a leader, invented Lord George Bentinck. Lord Dalling justly remarks that "the fact that Sir Robert Peel resigned office on changing his policy, and that he did not return to it until every other Ministerial combination had failed, rendered his course on this occasion more clear than on the Catholic question. To accuse him under such circumstances of changing his views in order to retain office is as absurd as it is unjust." Lord John Russell had announced his adherence to the Corn-law League two or three weeks before Sir Robert Peel determined to repeal the Corn Laws. No other course could have brought the leader of the Opposition into office, or turned the Prime Minister out. Lord John Russell was perhaps justified in declining on a trivial pretext the task of forming a Ministry (to carry Corn-law Repeal). He would have encountered a Conservative majority in the House of Commons, and he could not have disposed of the Duke of Wellington's indispensable authority for the management of the House of Lords. The legend that the Duke overruled the scruples of conscientious Protectionist peers by replying, "You cannot object to the Bill more than I do, and I shall vote for it," probably represents not inaccurately the arguments by which he secured a majority. The indecent and inconsistent haste with which Lord John Russell took advantage of Protectionist discontent is less excusable than his devolution of an arduous task on his opponent. His coalition with the unscrupulous leader of the Protectionists to defeat the Irish Coercion Bill of which they both approved succeeded in the object of making Lord John Russell Prime Minister, and of gratifying Lord George Bentinck's implacable animosity. Soon afterwards Peel enjoyed the dignified revenge of assisting Lord John Russell to carry a Coercion Bill which was virtually the same as his own. On his resignation Sir Robert Peel determined that he would never again take office; nor is it certain whether, if he had lived, he would have yielded to the unanimous urgency with which in difficult seasons the nation would have demanded his return to power. During the four remaining years of his life he held a higher rank than that of any Minister or leader of an Opposition. Perfectly free from party connexion, he gave a general support to Lord John Russell, with whom he had always in the House of Commons maintained courteous and almost friendly relations. It was against his will that on the eve of his death he voted for a censure on Lord Palmerston, in the justice of which, as afterwards appeared, Lord John Russell privately concurred. It is probable that both were mistaken, but Sir Robert Peel can scarcely be blamed for sharing the opinion of Lord Palmerston's principal colleague:—

The most triumphant portion of Sir Robert Peel's political career was indeed that which followed his exclusion from official life. I know of no statesman who ever occupied so proud a position as that in which a greater Commoner than even the first William Pitt stood from 1846 to July 1850, when an unhappy accident filled with patriotic sorrow every heart in England. Above all parties, himself a party, he had trained his own mind into a disinterested sympathy with the intelligence of his country. He never during this period gave a vote to court democratic influence or to win aristocratic favour.

As far as wisdom can be independent of far-seeing prescience, Sir Robert Peel was one of the wisest of men. Even those who dispute his sagacity ought to admit his admirable honesty. He probably never supported or opposed a measure under the influence of personal motives. When his death was announced in Parliament, Mr. Gladstone delivered in the House of Commons a cold and conventional eulogy on his deceased leader. In the House of Lords, the Duke of Wellington, never ready of speech nor prodigal in expressions of feeling, repeated more than once, with deep emotion, the statement that, among all men whom he had ever known, Sir Robert Peel was remarkable because he always told the truth. Two dissimilar natures were united by a common instinct of veracity, in which the Duke probably intended to include habitual uprightness of purpose. Lord Dalling's eulogy is an authentic and valuable contribution to the history of the statesman whom Mr. Disraeli once described as the greatest member of Parliament that ever lived.

CRAWLEY'S TRANSLATION OF THUCYDIDES.*

THREE kinds of merit can enter, separately or together, into a translation of Thucydides. It may have an historical, a literary, and a scholarly value. It will have historical value if it makes the subject-matter accessible to a student of history, not merely by a clear version, but by such aids of analysis and division as modern ideas of lucid arrangement suggest. This alone would be worth doing. The singularities of Thucydides as a writer perhaps too often divert attention from his greatness as an historian. Those who associate his name with passages of a perverse, or a brilliant, intricacy are probably more numerous than those who have learned to look at his work as a whole. It would not perhaps be too much to say that for many readers the character ascribed by Thucydides to his own performance has been reversed by the unconscious irony of modern classicism. For the University man, as a rule, it is to be feared that the History of the Peloponnesian War represents—in a sense undreamed of by the compiler—the "exploit of the hour" rather than the "everlasting possession." A well-arranged trans-

* *The History of the Peloponnesian War by Thucydides.* Translated into English by Richard Crawley, Fellow (non-Resident) of Worcester College, Oxford; and formerly Scholar of University College, Oxford. London: Longmans & Co. 1874.

lation will have done good work if it makes men read Thucydides as a whole; not laboriously, as in the twilight of conflicting commentators—not with a sense of literary loathing, as in a glaringly bad translation—but comfortably, with nothing violently to interrupt the mind while it gradually receives the impression of his intellectual strength and absorbs the lessons of his political wisdom. It takes a little thought for men of to-day to see how great Thucydides was. All the forms of political experience which his own age could furnish to him resolved themselves into two—the Greek City and Persia; on the one hand, the small commonwealth, with the idea of the nation still far away in the future; on the other hand, the despotic monarchy, not properly a political government at all, and perhaps less instructive to the observer than any other. But the scanty materials were enough for his genius. As we read him, we feel that he would have been able to apply the principles gathered from these phenomena to cases the most complex, and the least like those which he had known. The feudal France or Germany of the past, the constitutional England or federal America of to-day, would have discovered to him, under all contrasts of form, essential analogies with the things of his own age. It has been said of Thucydides by a great living scholar and historian, "There is hardly a problem in the science of government which the statesman will not find, if not solved, at any rate handled, in the pages of this universal master." The prosperity of Athens after the expulsion of the Peisistratidæ calls forth from Hérodotos the remark that "freedom is a fine thing." The interval, in regard to subtlety, between this comment and the criticisms of Thucydides on the Coregorean sedition, does not unfairly represent the difference between the capacities of the two men for a philosophy of history. Personal impartiality is a quality more immediately obvious than width of mental grasp; and when it has been admitted that Thucydides, an oligarch banished by the democracy, is sometimes rather hard on Kleon and on Hyperbolos, there is little to deduct from the praise of a wonderfully dispassionate narrative. Xenophon could relate the Theban revolution without naming Pelopidas, and the battle of Leuktra without naming Epameinondas. He could record the smallest doings of Agésilas, but forget to mention that Megalopolis had been founded or Messénia delivered. Thucydides, so far as we know, has suppressed nothing; nor—with the doubtful exception just noticed—has he set down aught in malice. Seldom indeed does he permit himself a word of praise or blame. The treachery of Paches to Hippias provokes no commentary. The characters of Themistoklès and Periklès suggest no moral criticism. The historian who, with these qualifications, has described a great crisis of ancient Greece ought not to be less attractive than Olarendon. If a translator who makes Thucydides as possible as Olarendon for the English reader can achieve literary and scholarly merit too, so much the better. Literary merit will consist in attaining the end which Conington proposed to himself in his translation of the *Æneid*; that is, in making the work, in respect of style, not merely readable, but agreeable or brilliant as a whole. Scholarly merit will depend on a precise correspondence, expressed in an artistic form, between the English version and the Greek original.

Mr. Crawley's translation has historical merit, as above explained, in a high degree; literary merit in a considerable, though not in an eminent, degree; scholarly merit in a very inferior degree. One of the best features of the work is the recasting of the original into larger chapters determined by the grouping of events. The contents of the eight books are thus made by Mr. Crawley to fall into twenty-six chapters, care being taken that the beginning of a book shall always coincide with the beginning of a chapter. Descriptive titles are prefixed to each of these new and larger chapters. The events narrated in each chapter, and the years to which they severally belong, are exhibited in a complete tabular analysis. For facility of reference those chapters of the ordinary arrangement which are comprised in each chapter of the translation are indicated at the head of each page. Here we would have suggested a trifling improvement of detail. Opening the translation, say, at Book II., Chapter VIII., we see by a glance at the top of the page that this Chapter VIII. of Mr. Crawley's answers to parts of Chapters 88 and 89 in the original. But there is nothing to mark the point at which Chapter 88 ends and Chapter 89 begins. If we wish to compare the Greek with the English we must turn to the Greek and find this out for ourselves. It would surely have been easy, without deforming the page, to show in the margin where each chapter of the Greek text begins, and, for purposes of reference or comparison it would have been a great deal better. But this is a small matter. Mr. Crawley's general plan of arrangement is excellent, and, helped by the careful digest of subject-matter at the beginning, will give most readers just the kind of assistance which they most wanted in order to read the History with a continuous and intelligent interest. Nor will this interest flag through any fault of the style. Mr. Crawley writes spirited and vigorous English. He is far indeed from all that tameness or uncountness by which ordinary "cribs," or even works of a more ambitious kind, so vividly impress young minds with the fatuity or obscurity of the ancients. If he errs at all in this matter, it is perhaps rather in the other direction. The studious modernism of his narrative sometimes recalls the smartness of Our Own Correspondent, while the idiom of the speeches, Parliamentary in its dignity and somewhat dull in its perspicuity, sometimes almost makes one crave for a change, a little of that homely clumsiness whereby the honest "crib" of other days at least reminded one that Alkibiadès was not a member

of the House of Commons. If, however, a subtler artist would in many places have been simpler, and in some places stronger, yet the general literary merit of this translator must be put high.

Now we come to scholarship. In these days translation has passed out of the hands of those whom M. Taine calls *chevaux de fronde littéraire*, and whom our ruder idiom calls hacks, into the hands of scholars. Two principal causes have created a demand for good translations of the Greek and Latin classics. One cause is the growing variety of intellectual interests, which tends to lessen the number of specialists in the old paths. Another is the new clearness of the antithesis between Literature and Science. There is a Science of Language. But those for whom Science means principally Mathematical or Physical Science naturally treat the Greek and Latin classics as so much literature; and, caring comparatively little for the niceties of form, use it as they use other literature, *i.e.* read it chiefly for the subject-matter. Scholars who join literary faculty to fairly accurate knowledge have used the opportunity well on the whole. But it is rare indeed to meet with an English translation which will bear the test of close comparison with the original. Not one translator in a hundred is capable of satisfying such a test. Not one reader in a thousand is likely to apply it. Mr. Crawley's work seems to us to maintain the best average of scholarly accuracy in the ordinary narrative passages. This is one of its chief merits. It is conscientious throughout, and does not fall below the mark in those places where a translator of a long book is most likely to "scamp" his work. The best proof is to take a chapter which offers no special difficulties of any kind. Take, for instance, the short narrative chapter, V. 39 (V. 16, p. 366, in the translation). The only point to which we should take exception here is the version of the words at the end, *τὰ Πανάκτον ὁδὸς καθήρειτο*, which Mr. Crawley renders "Panactum was instantly razed." The words mean, "The dismantling of Panakton began at once." Dale has at least kept the meaning of the tense—at whatever cost—when he translates "Panactum was immediately begun to be demolished." Slips of this kind may seem trivial; but they take away from the scholarly value of a translation, and, where facts are in question, from its historical worth too. It is, however, less in the narrative than in the rhetorical passages that Mr. Crawley's accuracy is at fault. The passage in the speech of Periklès (II. 42), *δοκί δὲ μοι δρῶν ἀνδρὶς ἀρετὴν . . . μᾶλλον ἢ τοῦ εἶους ἀπὸλλάττειν*, is thus translated (p. 125):—

And if a test of worth be wanted, it is to be found in their closing scene, and this not only in the cases in which it set the final seal upon their merit, but also in those in which it gave the first intimation of their having any. For there is justice in the claim that steadfastness in his country's battles should be as a cloak to cover a man's other imperfections; since the good action has blotted out the bad, and his merit as a citizen more than outweighed his demerits as an individual. But none of these allowed either wealth with its prospect of future enjoyment to unnerve his spirit, or poverty with its hope of a day of freedom and riches to tempt him to shrink from danger. No, holding that vengeance upon their enemies was more to be desired than any personal blessings, and reckoning this to be the most glorious of hazards, they joyfully determined to accept the risk, and making sure of their vengeance to leave their wishes to take care of themselves, and committing to hope the uncertainty of success, to trust to action in the business before them. Thus choosing to die resisting rather than to live submitting, they fled only from dishonour, but met danger face to face, and after one brief moment, while at the summit of their fortune, were taken away, not from their fear, but from their glory.

On this version we would make the following comments:—(1) *δοκί δὲ μοι δρῶν ἀνδρὶς ἀρετὴν*—*πρῶτη τε μνησέμεναι καὶ τελευταία βεβαιώσαι ἢ γὰρ τῶντε καταστροφῇ* is surely very loosely rendered by the sentence which opens the extract just given. It might have been more compactly and more simply rendered thus:—"I find a true illustration of worth—whether it be as a first manifestation or as a crowning proof—in the final scene of these men's lives." (2) "For there is justice in the claim that steadfastness in his country's battles should be as a cloak to cover a man's other imperfections." The original is:—*καὶ γὰρ τοῖς τάλῃα χεῖροσι δίκαιον τὴν ἐς τοὺς πολέμους ὑπὲρ τῆς πατρίδος ἀνδραγαθίαν προτιθεῖσθαι*. Now it is here a question whether *ἀνδραγαθίαν προτιθεῖσθαι* means "to put forth valour," or "to put forth valour as a pretext." In the one or other place of Thucydides where the phrase occurs, it means "to put forth valour" (III. 64), *ἐπὶ τῇ ἐκείνων κακῇ ἀνδραγαθίαν προτιθεσθαι*. As far as we know, there is no instance in properly classical Greek of *προτιθεῖσθαι* in the sense of *σπῆναι προτιμεῖν* or *σκηπτέσθαι*, though Polybios has (II. 19) *συγγένειαν προτιθέμενοι*, "alleging kinship," nearly in that sense. Yet here we believe that Mr. Crawley has rightly followed Dale in adopting this meaning. Our reason is the construction of the sentence. If Thucydides had meant to say, "Men otherwise inferior ought to put forth valour (at least) on behalf of their country," he would have written, surely—*καὶ γὰρ τοῖς τάλῃα χεῖροσι* (or *τοὺς τάλῃα χείρους*) *δίκαιον τὴν ἐς τοὺς πολέμους ἀνδραγαθίαν ὑπὲρ τῆς πατρίδος προτιθεῖσθαι*. But we cannot approve Mr. Crawley's translation, which looks as if, with Arnold, he had taken the middle *προτιθεῖσθαι* for a passive. We should prefer to render:—"It is fair that men otherwise inglorious should claim the merit of courage shown in their country's battles." (3) The words, "They joyfully determined to accept the risk, and making sure of their vengeance to leave their wishes to take care of themselves," represent *ἰβουλὴθῆσαν μὲν αὐτοῦ* (sc. τοῦ κινδύνου) *τοῦ μὴ τιμωρίσθαι τῶν δι' ἐπείσεσθαι*. The italicized phrase will surely not do for *τῶν δι' ἐπείσεσθαι*. We would translate it:—"They were content to make that venture, to deal that chastisement, to battle for those desires." (4) "And committing to hope the uncertainty of success, to trust to action in the business before them." The

italicized words altogether lose the vividness of *περὶ τοῦ ἥδη ὁρμήσαντος οφίου*. Render:—"Committing to hope the uncertain issue, but, for what confronted them, resolved to trust themselves."

(5) "*Thus choosing to die resisting*," &c. The original is *καὶ ἐν αὐτῇ τῷ ἀνίστασθαι καὶ παθεῖν μᾶλλον ἡγησάμενοι*: where *ἐν αὐτῇ* refers back to the *κίνδυνος*, and contrasts the anticipation with the presence of danger. "Thus" does not translate *ἐν αὐτῇ* at all. A little afterwards, the words—"they fled only from dishonour, but met danger face to face" are the equivalent of *τὸ μὴ αἰσχρὸν τοῦ λόγου ἔφυγον, τὸ δ' ἔργον τῇ σώματι ὑπέμειναν*. Here, as it seems to us, *τῇ σώματι* is inadequately rendered by "face to face." In Greek phrase, *τῇ σώματι ὑπέμειναν* is much more than "met in the body"; it is, strictly, "endured with the life"—i.e. at the cost of life. The whole passage, *καὶ ἐν αὐτῇ—ἀπῆλλάνυσαν* might be rendered thus:—"And, when the danger came, assured that to strike and suffer was better than to yield and be spared, they shielded their memories from shame by standing the ordeal with their lives; and in an instant, at the supreme moment of their fortune, passed from the place, not of their fear, but of their fame."

As an aid to the reading of Thucydides, whether as a history or as a book, Mr. Crawley's translation is valuable. Both in division and in diction it is excellent. It does not, however, reach the standard which modern scholarship exacts before the English translation of such an author can be pronounced consummate and final. It betrays a want of that special and laborious training sometimes, though oddly, called "pure" scholarship, which Mr. Crawley in his vigorous satire, "Horse and Foot," has confessed to be unsatisfying to a modern Byron, but which is necessary for a translator of Thucydides.

MAN AND BEAST.*

IT is a pleasant and popular kind of book-making to compile amusing anecdotes of the habits of animals. Where these are ordinary examples of the ways of a class or species, they may have a scientific value as illustrations of natural history. The exceptional behaviour, too, of individual creatures on particular occasions may prove worth our attention. But a more strict examination seems to be required for instances of the latter kind. They are not, like the former, alleged to have got the confirmation of invariable results observed under the like circumstances. All that can be said is that such things have frequently been related by credible witnesses. The rare and surprising character of special exhibitions of sagacity or apparent moral sensibility in animals is confessed by the narrators. An air of the marvellous, sometimes even of the miraculous, affects the general apprehension of these interesting facts. This atmosphere of wonder presently stimulates the gratified mind to a very agreeable exercise of free thought. It may unconsciously permit itself to relax its vigilant scrutiny of accounts received, if not to magnify and colour, by the illusory optics of imagination, stories often repeated.

The discovery that there is much cleverness in our dumb companions, and that they are highly capable of social affections, must be welcome to good-natured persons. But it remains as yet a subject of continual wonder. Now the emotion of wondering is apt, in the most honest and simple minds, to engender mythical conceptions. There is a great risk of self-deception in crediting, and of undesigned exaggeration in relating, singular proofs of the mental endowments of our favourite animals. The partiality of ownership and guardianship is likely to influence their masters, and still more their mistresses, in observing, interpreting, and remembering their acts. This patronage of beloved dependents among inferior species has the same effect as parental tenderness. A fond mother's joyous recital of the precocious feats of her infant may not uncharitably be taken with a certain reserve. We listen next to the maiden lady who tells us something equally remarkable of her toy terrier or the demure and graceful Tabby on her velvet cushion. This lady also believes what she says, and her tale is but a slight unintentional improvement of the fact. But we do not hasten to encumber the studies of the zoologist and the comparative psychologist with records of this description. With a sentimental or fanciful predilection, however, for a certain theory of animal life, one might be disposed to put them forward as contributions to science and philosophy. But then one would not gain the credit of being a philosopher or a truly scientific man.

Mr. J. G. Wood is a professed admirer of *Science Gossip*. That publication has its modest merits and its uses of instruction and of entertainment. Take a large quantity of the sort of anecdotal lore which it contains, mixed with household gossip of many private families concerning their pets in parlour and kitchen, in farmyard, kennel, and stable. Add to this natural history gossip a very small dose of philosophy gossip, and a little dash of theology gossip. Let these ingredients be just thrown together, but not stirred to mingle, and still less to be compounded, by any argumentative working. They may fill a couple of volumes, in which two chapters, the first and the last, present the mere forms of discussion, while gossiping anecdote makes up all the rest. This compilation will suit the taste of many readers. But we cannot allow it to pass for a treatise upon the immortality of the soul in the lower animals. For this is a grave and difficult question, to

say the least of it. Some of the most powerful thinkers have barely touched it, with a reverential feeling of reserve. They have regarded it, finally, as one that can hardly be answered, and one that we are not concerned to answer. Bishop Butler undertakes to show that there is a very considerable degree of probability in the idea of a future life for mankind. His views of the "living agent" within the body may be objected to, his remarks, as equally applicable to brute animals. To such an objection he would reply that we do not know whether a future life may not be in the order of nature for them also. If it be so, they may or may not be capable of developing, in that higher state, the powers of rational insight and moral determination. Butler does not think fit to take either side of the question, but his inclination to the affirmative may be presumed from its bearing on his proper line of argument. If no substantial reasoning in favour of the immortality of brutes could be found by Butler, it was hardly to be expected from Mr. Wood. All he can produce for it, after an examination of texts in the Bible showing that Scripture does not expressly deny it, is set forth in one sentence. "I am convinced," he says, "that any creature which is capable of suffering has in that very capacity its passport to the eternal life for which its sufferings are but a preparation." This is but a sentiment, which can only derive the force of an argument from the assumption, elsewhere set forth, that "Divine justice" cannot be vindicated without compensation hereafter for bodily pains endured in this world. We do not care to scrutinize the soundness, either upon ethical or theological grounds, of such a passionate opinion with regard to such a matter. It has been noticed only as a sample of the quality of Mr. Wood's substitute for solid philosophical thought in support of a vast proposition. Willfulness in "claiming" that the laws of the universe be conformed to our own "ideas of right and wrong" is not the temper of a candid searcher for truth. Mr. Wood, indeed, would seem to have peculiar sources of information both concerning the action of spirit upon matter here, and concerning the arrangements of the "spiritual world." He is enabled to assert that all the different species, as well as the individual living creatures, will have a continued existence hereafter. "Man will be man, and beast will be beast, and insect will be insect, in the next world as in this." We do not blame the indulgence in a romantic fantasy so congenial to the naturalist's favourite pursuits. But when the naturalist comes forward as a supernaturalist it is time to warn him against mistaking his vocation.

For Mr. Wood, to the regret and dismay, we should think, of many readers who have hitherto been entertained by his natural-history gossip, now appears to be a believer in ghosts. He inserts at the end of his second volume the story of a lady he knows who saw the ghost of an ugly old woman that had hanged herself in a French chateau. The ghost, a hideous little hag with a glare of fiendish wickedness in her eyes, was sitting in a high-backed armchair by the fireside. The lady's cat first saw this apparition, and then the lady herself saw it. Mr. Wood believes this story, because he has read in Scripture that Balaam's ass saw the angel before Balaam did. Further, he takes it as a proof that the lower animals possess "spirit" because they are capable of "spiritual as well as material vision." This instance accordingly becomes the crowning example in proof of his contention for the immortality of the lower animals.

Now we like Mr. Wood as a pleasant storyteller in his own department of study and observation. These two new volumes of his are filled for the most part with anecdotes which are very entertaining. Some of the facts related occurred within his personal observation. But a greater number were communicated to him by friends or people of his acquaintance. Many of these stories are such as we can have no hesitation in believing, and such as we have read or heard before. They are quite sufficient to prove, if anybody doubts it, that the lower animals possess faculties of understanding, though not the supreme faculty of reason; and that they are capable of the social affections, and of moral culture through love of approbation and self-esteem. We should be willing enough to grant equal acceptance to some other anecdotes in Mr. Wood's collection, which would indicate the possession by animals of superior mental faculties. But how are we to get on with him as a storyteller if he insists upon telling us a ghost story? As a gentleman who has studied natural history and is accustomed to take notice of various kinds of animals, he might be deemed an excellent judge of the probability of any stories about them. One would be glad to rely upon Mr. Wood's discretion as a compiler of facts in the familiar department of his many previous works. But when once he has committed himself to a ghost story, the confidence of a reader is likely to be shaken. A dog story, a cat story, or a bird story, which one might otherwise enjoy with unquestioning faith, is thereby overcast with a shadow of doubt.

There is the story, for instance, of Lady E.'s cat Tiny, whose sense of the dignity of the family to which she belonged was shown in a practical manner. She was scandalized by remarking an empty dish on the breakfast-table. So she jumped out of the window and fetched a lobster from the table laid in a neighbour's house. It must be rather difficult for a cat to carry a lobster, but that is the least of the wonder. Tiny had no intention of stealing the neighbour's victuals. The lobster was only borrowed for a pantomimic lesson to her human friends. She just held it in their sight over the empty dish, to show her opinion that they ought to have provided a lobster of their own to put there. Having performed this instructive action, Tiny instantly carried the lobster back to the neighbour's breakfast-parlour, and replaced it on the table exactly where she had found it. Now, if Lady

* *Man and Beast, Here and Hereafter*. Illustrated by more than Three Hundred Original Anecdotes. 2 vols. By the Rev. J. G. Wood, F.R.S. London: Daldy, Isbister, & Co. 1874.

E.'s cat really did all this, from the motive imputed to her by Mr. Wood, her mind performed a very complex process of ratiocination. A child several years old would not go much further in sustained combination of thoughts and purposes. This little animal, it seems, understood that the articles she found in one house were the lawful property of one person, but that those which lay in the next house belonged to another person. She understood the distinction between borrowing an article for a temporary use and taking it with entire appropriation. Her powers of abstraction and generalization had mastered the logical difference between the idea of a lobster in general, which was what she meant to suggest as the thing to be procured, and that of the particular lobster, which she so carefully restored to its owners. And she deliberately planned this series of consistent performances in order to remind Lady E.'s household of their respectability, and of their right to as good a breakfast as the people next door prepared for themselves. A cat which could imagine and execute such a design might well, for aught we know, be as capable of going to Heaven as any Christian. But, without impeaching either Mr. Wood's or Lady E.'s veracity, we doubt their account of the facts. Supposing that Lady E. actually saw the cat enter her parlour with the borrowed lobster, and make a display of it on the table, over the empty dish. The cat presently afterwards takes it away, jumping again out of window. The lobster is found, a few minutes later, upon the table where it ought to be, in the neighbour's house. But was there a strict inquiry how it came there? Is it quite certain that the cat did not drop the lobster, or that a servant did not take it from her, and that it was not replaced, as it naturally and properly would be, by human hands? In that case, all we could say of it would be that a cat stole a lobster, and was compelled to part with it. The omission or accidental defect of some links in the chain of observations will completely alter the probable explanation of these stories.

It behoved the editor of such anecdotes, when they were to be adduced for evidence in a serious philosophical argument to exercise a judicial scrutiny of their minutest details. Mr. Wood has not, so far as we can see, attempted to do his duty in this respect. The mood in which he affects to interpret nature, throughout these trifling volumes, is that of humorous conjecture. Our readers might easily be amused at a cheap rate by quoting some more examples of his collection. For the mere purpose of amusement his book will do very well. Many things of the same kind have appeared; and Mr. W. H. G. Kingston's *Stories of the Sagacity of Animals*, with pictures by Mr. Harrison Weir, is a selection to please and to edify children.

But the limitation of mental capacities in our not articulately speaking fellow-creatures has always been apparent to the commonest observation. That they have understanding, as well as instinct, is no recent discovery. Aristotle compared the mind of a brute to that of a man in earliest infancy. It is remarked by Sir Benjamin Brodie that in the humbler mental operations of the animal may be traced the rudiments of those faculties which are more completely developed in the human intelligence. The observation of Locke, that in brutes the faculties of comparing and combining ideas are confined to "sensible circumstances of the objects," not extending to abstract conceptions, is plausible enough. What is the organic peculiarity that causes this deficiency of mental power, we cannot indeed say; but a similar condition may be detected in the human mind afflicted with idiocy. It might be worth while also to compare this permanent deprivation, or this lack by nature of the faculty of abstraction, with its temporary suspension in the mind of a dreamer, or in that of a drunken man. In these cases, as we all know, the lower functions of the understanding may be extremely active; the somnambulist, for example, may converse, compose, and calculate with regard to objects or symbols made previously familiar by his former perceptions. But the mind has for a time lost hold of the generalizations to which, in the alert self-possession of its full waking power, all phenomenal ideas would be referred. It is probable that the imperfectly developed intellect of the lower animals may rest nearly at this stage. By the associations of sensible ideas they acquire a faculty of empirical reasoning; and the domesticated animal, being an affectionate creature, with strong emotions of love, pride, and shame, gets a customary conscience from the approving or rebuking voice of his master. The understanding is vastly improved by making the animal in course of training acquainted with words or signs of whatever purport. Indeed no brute could ever invent any kind of symbol for an idea in its own mind, but it can apprehend the symbol when taught. This is a help to more complex combinations of ideas. Without express teaching, and even in the wild state apart from superior example, animals can learn to adapt their conduct to varying relations, and to perceive methods of obvious expediency. All this, however, differs most essentially from the rational apprehension of principles, of causes, or of ultimate ends, which belongs to mankind alone, and which is the ground of moral responsibility. There is no real foundation, therefore, so far as our knowledge extends, for applying to brutes the ordinary argument in favour of a future retributive existence. But we do not know what latent powers of mind may belong to these creatures "that nourish a blind life within the brain."

THE AUSTRIAN OFFICIAL HISTORY OF THE WAR OF 1859.—PART II.*

BARON KUHN, who has lately had to yield his post to the reactionary military party, held office at Vienna long enough at least for one purpose—the setting forth clearly his own share and that of his former chief, (General Gyulai, in the great campaign which wrested Lombardy for ever from Austria, and made Italy, if not the free country "from the Alps to the Adriatic" which Napoleon had promised to create, at least something much more than the geographical expression which she had for centuries been. We noticed his first volume on its appearance, and took occasion to show how thoroughly the work of the new Historical Section of the Austrian Headquarter Staff had been done, and how completely the influence of the War Minister had triumphed over the hereditary reticence that makes the despair of the student of many of the former wars between France and Austria. Not only are the military movements on either side chronicled with an exactness which defies hostile criticism, but the whole diplomacy of that curious epoch is laid bare, when Prussia, hardly yet acknowledged for the first-class Power she had long claimed to be, was divided between jealousy of Francis Joseph and fear of his adversary.

Few volumes have ever dealt with a subject so effectually as that which we then reviewed. It traced the war from its origin down to the great battle of Magenta, which for the time restored its old military renown to the name of Napoleon to an extent that many of our younger readers are hardly aware of. The one point that remains undiscovered in the history of that victory is to whose happy inspiration it was due that the French Emperor threw his army over the Ticino by a wide flank movement as bold and well conceived as his great uncle's brilliant stroke of strategy against the same Austrians on the Danube fifty years before. Nobody nowadays credits Napoleon III. or his Chief of Staff, the worthy but very commonplace Marshal Vaillant, with this inspiration. It has never been claimed by any one for MacMahon, though his corps chanced to bear the brunt of its execution and he took his title from its success. Possibly the secret may have died with Marshal Niel, who was too loyal a servant of the Second Empire to have desired to strip his master of the glory of an achievement which for long made men count him one of the best soldiers of his age. At any rate the former Austrian volume, at all other points so satisfactory, threw no light on this comparatively personal question. But it illustrated from first to last the incompetence of the Austrian Government to deal with the terrible problem which the growth of national aspirations in Italy, and the ambition of France to take the leadership afresh in Europe, had brought it face to face with. It showed, too, with a clearness that proved Baron Kuhn to be quite free from that leaning to Berlin of which some of his late colleagues have been accused, how that ambition was favoured from first to last by the half-heartedness of Prussia in the cause of Germany; a half-heartedness so apparent that it forced the usually backward and timid minor States to summon her to the action on which she entered, when thus forced to it, too late for any useful purpose in arresting the triumph of the Gaul. And, above all, it made clear the fact that, from the first, the old general at whose right hand Colonel Kuhn stood in Italy took a practical view of the coming contest, foresaw clearly that the French would throw the weight of their assault on Austria on the Italian side, where their reception would be cordial, and the alliance popular throughout Europe, and vainly urged upon his blinded superiors at Vienna the necessity for giving him the means of meeting the coming shock by diverting to Lombardy the masses of troops with which they were preparing to meet invasion by the Rhine and Danube; where the first shot would certainly have roused all Germany against Napoleon, a result which that monarch had quite sagacity enough to avoid.

The volume now published, which was completed just before Baron Kuhn left his post at Vienna, takes up the story of the war on the evening of the great confused struggle round Magenta, when a full half of the French army was unaware of its victory, and more than half the Austrian unconscious of its defeat, and carries it down to the 20th June, when Gyulai's retreating force halted behind the Mincio to come into line with the so-called First Army—a more recently formed command, under General Wimpffen, which had been brought up to support it. It will be remembered that, long before the campaign began, Gyulai had pointed out in the plainest terms the insufficiency of the force allotted to him for the double-purpose of holding Italy, notoriously ready to rise against his master, and meeting the French attack which he had good reason to fear. The answer to this had been the detachment direct to him of certain reinforcements—part of these being despatched so late that they were actually within a few miles of Magenta without being able to share in the battle—and the creation of a new army in his rear to hold Venetia and watch the Adriatic coast. Viewed by the light of Kuhn's elaborate narrative, the history of the sixteen days covered by this volume, which breaks off at the meeting of these two forces, the heat of which was defeated at Solferino, may be told briefly as follows.

Gyulai retreated slowly from the Ticino, followed more slowly still by the French, who were too much exhausted by their successful struggle for the passage of that stream to attempt to press his rearguard. Milan, on hearing of the Austrian defeat,

* *Der Krieg in Italien 1859.* Von dem K. K. Generalstabs-Bureau für Kriegsgeschichte. 22^{ter} Band. Wien: 1874.

showed such symptoms of immediate insurrection that no attempt was made by her late masters to hold her, and MacMahon's Corps marched through the streets of the rejoicing city in triumph on the 7th of June, three days after the victory to which he had so largely contributed. But by this time the Austrians had recovered heart. Their leaders knew that it was not their own fault that the right wing under Olam Gallas, which was crushed at Magenta, whilst the centre and left held their own, had been deprived by malarrangements at Vienna of part of the succour destined for it, which might have enabled it to hold its ground. The whole army had had its spirits raised by the news that General Urban's flying division, detached far northward in chase of the beaten Garibaldians near the Lago Maggiore, and so abandoned and thought to be cut off beyond the Ticino, had skillfully extricated itself from its peril by a rapid flank march round the advancing enemy. Best of all, the young Emperor, now arrived at Verona to take personal direction in Italy, had plainly not lost heart at the first defeat; for orders were telegraphed from his headquarters which, while permitting General Gyulai at his own discretion to abandon all Lombardy up to the Adda, and withdraw his troops behind the river, enjoined on him "to leave nothing untried that could retrieve affairs at once, and to profit by any favourable chance that presented itself."

Such a chance there appeared to his Chief of Staff to exist now, when the French and Sardinians, coming out of the inaction which at first followed on their victory, were pressing rather loosely forward in pursuit of what seemed to them a hopelessly beaten adversary. Cavalry officers with the Austrian rearguard made their general situation known, Baron Edelsheim, the present head of that arm in Austria, distinguishing himself here especially by the vigilance with which he patrolled along the flanks of the French columns, parts of which were already advancing towards Melegnano, the key-point of the country between Lodi and Milan, whilst the rear of their army had not yet reached the latter city. Their general direction eastward, in fact, kept them rather to the north of the line on which the Austrians were retreating; and hence Baron Kuhn conceived the bold scheme of turning his army suddenly back on its traces, and pushing vigorously to the north-west—a movement which, if successful, would break in upon the French line in flank before Napoleon could form a fresh front to meet it. It would repeat, in fact, the strategy of Schornhorst's which brought the allies to Lützen on the flank of the great Napoleon in 1813 so unexpectedly that his triumphant advance across the Saxon plains would have been turned into a defeat had it been an ordinary tactician who was thus surprised. On the 8th of June the orders were all prepared, arrangements made for sending all spare baggage behind the Adda for safety, and the scheme fully approved by Gyulai, who with his own hand added some finishing touches to the instructions about to be despatched to the corps.

The care with which the part of this volume is elaborated which contains the details of a project never realized proves that Kuhn, when in high office many years after, did not repent the advice he had given to break with the old Austrian traditions, and change a disheartening retreat into a sudden and bold advance upon the pursuer. Without knowing exactly how far he may be by nature over-sanguine it is difficult to judge what were the real prospects of success, so largely must they have depended on the trustworthiness of his troops. But throughout life the ex-Minister for War has been fated to see his boldly designed projects shattered against the obstinacy of other soldiers who cling closely to tradition. So it was in this particular instance. Baron Hess, the Austrian Quartermaster-General, whose intermeddling is charged with a great part of the Magenta catastrophe, had returned to Gyulai's headquarters, which he had left just at the time of that battle. Hess had been in many respects the right-hand of Radetsky, long the Wellington of the Austrian army, and enjoyed that sort of consideration at this time which was the lot of Lord Raglan among ourselves after Wellington's death. No one ventured to gainsay his deliberate opinion, which indeed would probably have been supported had he appealed by telegram to Verona. And, to his cautious view, the turning back a defeated army to attempt a counter-stroke, however well devised, on a pursuer believed to be superior in numbers and in better heart, would have been inexcusable rashness. He condemned Kuhn's plan as soon as it was communicated to him, and Gyulai, though nominally free to act under the Emperor's express instructions, did not venture to dispute his fiat. The idea of advance was therefore at once abandoned, and preparations made for continuing the retreat across the Adda.

This retreat was to be, as before, cool and methodical. Such a movement implies well-posted rearguards in strong positions, and these are liable to be sacrificed if the pursuers prove energetic. Such was just the case in this instance. Napoleon had meanwhile found out that the Austrians were apparently quitting Lombardy, and naturally resolved to push them. To do this it was necessary to possess himself of Melegnano, already indicated as the most important point, strategically of the slip of ground between the two armies; and on the night of the 7th June, before Hess had intervened to stay Gyulai in his intended movement of attack, Marshal Baraguey d'Hilliers had MacMahon's Corps added to his own command, with orders to attack and carry the position held there by the Austrian rearguard. This consisted of Roden's and Boer's brigades of Benedek's Corps, with two batteries, and a few squadrons of hussars. General Berger, who commanded, was made aware by Benedek of the importance of the position, which would

have been hardly less essential for the safeguard of the advance than for covering the retreat of the army; and when the shock fell on him late in the afternoon of the 8th, he withstood it with a tenacity which did himself and his division infinite honour. The fight that followed was the severest in this brief but bloody campaign. The French had to bring into action the greater part of the 36,000 men of whom Marshal Baraguey disposed; and the 8,000 Austrians who held the little town did not yield it without the loss of nearly fifteen hundred of their number. But the general who exposes a small force to be crushed by his enemy's superior numbers suffers the moral disadvantage of a genuine defeat; and the action of Melegnano, following so close on that of Magenta, with the retreat continued, and no counter-blow to put against it, gave the French an advantage which no doubt told to the end of the campaign. Disheartened and weary, though not further molested—the stout resistance of Benedek's troops had done at least that much for them—the Austrians fell back behind the Adda, and thence over the Mincio, where their Emperor formally assumed the charge of the Second Army, as he had already done of the First. Gyulai's command was soon after taken altogether from him, and he passed into history to be credited with all the misfortunes that opened the campaign. He might have been so for generations, instead of years, had not his Chief of Staff lived to climb the heights of power, and unlock the doors of the State cabinets which held the chief secrets of the war. He has shown from proof irrefragable that all the foresight, readiness, and prudence in Austria at the crisis of 1857 were embodied in her old general; all the rashness, imbecility, and tardiness displayed were due to that secret government—half family camera, half autocracy—which has so often dragged her into the mire of defeat and humiliation.

OLD MYDDELTON'S MONEY.*

THE monotony of modern life has been a frequent source of complaint among those who live it. For the real subject of complaint there is no doubt some reason. It is doubtful, however, whether the name applied to that subject is a correct one. There is in truth a good deal more of variety in these days of constant improvement and invention than there was in the days before them, when both invention and improvement were slow, and by no means always sure. One would think that the increased variety and power of life should give increased power and variety to those persons whose business or pleasure it is to describe life whether in the form of fact or of fiction. This, however, does not appear to be the case. The fact is that it is not the monotonous nature of modern life which ought to be an object of reprobation, but the tendency of modern, as of ancient, people to be monotonous. There is a wonderful inclination in human beings to follow sheep-like through the gap which chance or skill or a rare combination of both has led one among them to make. The vitality of this inclination is remarkable. It would not be unreasonable to hope that where the number of grooves in which it is possible to run is amplified, the running powers should learn to find the right grooves. Or, to use a simile which is not the worse for being well worn, one might expect that among a large number of holes the square and round pegs might more often discover their appropriate places.

Such hopes and expectations are matter for disappointment to many men of many kinds. To no one perhaps are they the occasion of more frequent discomfiture than to him who reviews novels. From him a complaint of the monotony of that part of life with which he has to deal may come with some justice. If the thing accorded in any way with its name, a novel ought to convey to the world something new, whether in idea or in form. To combine originality of thought and expression is a gift which but few writers possess; for the most part one is well content to find novelty of any kind in the romances of the present day. Unfortunately it is only in a few happy exceptions that the name novel accords in any sense with the thing which it signifies. Book after book appears in regular routine with the same old faults of loose construction, looser grammar, and characters ill conceived or not conceived at all. It is true that one does occasionally come upon some startling novelties in the way of grammar, but that is a kind of novelty which is hardly desirable. That so large a number of inferior books should be written in such an unceasing and invariable routine is probably due in part to that monotonous tendency of human nature which has been referred to. Formerly there were but one or two writers of fiction who could secure a hearing for themselves. The reason of this was probably to be found in the fact that they were the only writers worthy of attention. The appearance of the monthly number of one of their productions was looked for with some anxiety, and the number when it appeared was perused with some care. Nowadays we have changed all that. Innumerable novels appear from week to week and from month to month. No one waits the courage or the presumption to enter the lists with the masters of the pen. There are countless Richmonds in the field, and every one of them can rely upon enjoying some share of the popular attention. The wonder is that when everybody writes there should be anybody left to read. One cannot suppose that there is more spare time in the world now than there formerly was. It may be only that it is worse em-

* *Old Myddelton's Money*. By Mary Cecil Hay, Author of "Victor and Vanquished," &c. 3 vols. London: Hurst & Blackett. 1874.

played. Whether those who produce inferior novels or those who consume them make the more unprofitable use of their hours is an open question.

There are many novels which are utterly worthless and unworthy of attention. These one may accept as merely instances of the depraved stupidity of human nature, of the sheep-like idea that where one has made a way there others must follow. It is more disheartening to find indications of talent which is misused or wasted, of energies which patience might have directed to a good end hurried away and scattered by the impetuosity which cannot or will not learn. There are many manufacturers of fiction who, if they could but be brought to see that there is no royal road to the art of writing any more than to any other art, might produce at least good average work, if nothing higher than that. The axiom that a man must learn before he can teach has long been accepted as applying to every other art or handicraft in the world. Perhaps in time its truth will be found to extend also to the art of fiction. Meanwhile instance after instance of the deplorable consequences resulting from the absence of any such axiom comes before one's eyes.

A former book which was given to the world by the writer of *Old Myddelton's Money* was full of faults, but yet contained hints that its author could do better things if she tried. When noticing her first work, we expressed a hope that she might at a future date improve upon what she then produced. It cannot be said that her present performance has justified the indulgence of such a hope. The same faults which existed in *Victor and Vanquished* exist also in the writer's present work, and there is no new merit to counterbalance them. *Old Myddelton's money* is a vast sum of money left by a miserly old man in the hands of his sister to distribute among her relations as she thinks fit. This money had been left in the old man's first will to his nephew Gabriel, but that will was revoked by the uncle after a quarrel between the two, and on the same night the uncle was, as it was generally supposed, murdered by the nephew in an attempt to make away with the second will. The manner in which the story of this murder is told is singular enough. It forms the subject of conversation at a dinner where the Trent family, who count upon inheriting the greater part of old Myddelton's money, are entertaining a romantic stranger named Royden Keith. He is one of those remarkable persons who possess grave, handsome faces with sweet smiles, whose "tall, well-built figures, though full of strength and activity, are yet capable of an ease and stillness almost (why almost?) remarkable," whose iron wills are matched only by their tender hearts, and who are seldom met with out of the pages of a novel. The only other guest present is Honor Craven, a poor cousin to whom the Trents are patronizingly kind, especially Captain Hervey Trent, who graciously undertakes to teach her good manners. Here is a specimen of the behaviour of this family of people whose manners are supposed to resemble those of ordinary ladies and gentlemen. It may be remembered that their conversation takes place before a guest who is all but a stranger. Captain Hervey Trent has ordered one of his arms down the stairs to Honor Craven, the other to his cousin and supposed fiancée Theodora Trent. The latter has taken, the former refused, his arm:—

"My nephew offered you his arm, Honor," remarked Mrs. Trent, as she motioned the girl to the solitary seat on her left hand; "you should have taken it, my dear."

"Should I?" questioned Honor. "You will be tired presently of telling me what I should do or leave undone; won't you, Mrs. Trent?"

"Not if you try to learn," was the benignant reply. "Theodora and I will be patient with you to the end, and Captain Hervey is really anxious to see you study appearances. His eye, of course, is offended by awkwardness, but otherwise he is, I'm sure, pleased to see you always."

"Hervey," the girl said, turning her eyes full upon her cousin, as he took his seat at the foot of the table, "when shall I cease to offend your eye, so that that delightful time may come when you will be pleased to see me always?"

"I am pleased to see you now," remarked Hervey, with lazy patronage; "I was saying to Theo, only this morning, that your manners were very much improved."

This is singular enough, and it is a little strange that Miss Trent, who starts by saying that the subject of old Myddelton's murder is one so detestable as never to be mentioned among them, should presently tell the story at great length. One incident in this story is however so very strange as to deserve particular notice:—

"Honor, do not interrupt me again," said Theodora, once more taking up the thread which it pleased her to fancy that Honor had broken. "Well, Mr. Keith, once Gabriel and old Mr. Myddelton had a quarrel, and it ended in Gabriel's either being turned out of the house, or voluntarily leaving it. A message was sent at once to summon Mr. Myddelton's lawyer—the firm in Kinbury was Carter and Haughton in those days; now Mr. Haughton (I told you he was one of old Myddelton's relations and Honor's guardian) has the whole business. Well, Mr. Carter came, and Mr. Myddelton made his will, leaving his property, as I told you, to his sister, Lady Lawrence, to be, by her, bequeathed among his connexions. The lawyer was at Abbotsmoor nearly all day, and when he left the house at last, he met Gabriel returning to it. They stopped a little time talking, and Mr. Carter, being a silly, chatty old gentleman, told Gabriel of the will he had just left in his client's secret, and which would leave him penniless instead of a millionaire; adding a word of advice to him to try to regain his old position before it was too late."

The race of lawyers has been much calumniated in novels and novelettes both before and since the Attorney Case of Miss Edgeworth's *Simple Susan*. They have been held up as the types of the most abandoned criminality combined with the most treacherous cunning. But never has a more horrible picture of their depravity been presented than is here suggested rather

than conveyed. In the case of the vilest of other novel lawyers it has always been supposed that they were worthy of being entrusted with their clients' secrets, unless it were particularly to their advantage to betray their knowledge. Here, however, is an experienced practitioner, the member of a respectable and important firm, who out of mere chaitiness and playful malice reveals the alteration of a will, immediately after he has made it, to the person most interested in such alteration. As no comment is made upon this proceeding either by the author or the characters of her story, one can only conclude that such habits are part and parcel of an ordinary lawyer's fiendish nature. That this should be so is a startling and unpleasant reflection.

The consequence of Mr. Carter's being such an unfortunately "silly, chatty old gentleman" was apparently the murder of old Myddelton by Gabriel. Evidence was given at his trial by a girl named Margaret Territ, living in a cottage near old Myddelton's house, which led to his conviction and sentence to death. His escape from prison and from the country was however subsequently effected in a fashion which is unexplained until the end of the book, and then appears childishly improbable. The more important part of the first and second volumes of the book is taken up partly with the doings of the fascinating Royden Keith, who is for ever taking mysterious rides and giving mysterious orders to servants who are all ready to die for him, and crushing the wicked people of the story with mysterious ironical glances. In his doings it is not easy to take much interest. In the person who shares with him the interest of the novel, a little old lady named Mrs. Payte, it is possible to take a good deal of interest. She is the one success of the book, the one bit of clever character which redeems it from falling into the class of the utterly worthless. The author has done unwisely in taking Mrs. Payte so soon as she does out of her pages. Her odd ways and sharp sayings, her apparent cynicism and real kindness, are all well and lightly touched, and convey the idea of a real living person, which is more than can be said for the rest of the author's creations. The unsuspected mystery which belongs to her is also skillfully managed, and the discovery that she is in fact the Lady Lawrence who holds in her hand the gift of old Myddelton's money is almost as great a surprise to the reader as to those unfortunate relations of hers who have for so long been slighting her in the character of Mrs. Payte. The whole of the scene which follows her revelation of herself is well drawn, and one is sorry that nothing else in the book is up to its mark. There is a certain amount of merit in the conception of Honor Craven, the fortunate inheritor of the old man's hoarded wealth; but she is a strangely inconsistent person, and the reason for her refusing to marry Royden Keith, which is one of the turning points in the plot, is absurdly insufficient. So clever a girl must infallibly have detected the falsehood which led to her refusal, knowing as she did the jealous nature by which it was prompted. It was no doubt necessary, according to all precedent in novels, that the course of true love should in some way be prevented from running smooth; but one would think it possible to find some more probable obstacle to its course than that selected. The old story of falsely repeated conversations is very nearly played out. Besides, it would be much more likely that a girl of Honor's nature should ask the man whom she loved, when he asked her to marry him, if what she had heard was true, than trust on mere hearsay to his having spoken slightly of her.

The other parts of the plot are so many examples of the tendency to running in one groove which we have spoken of. It is quite in accordance with the human nature portrayed in ordinary novels that Royden Keith should be supposed by his rival in Honor Craven's affections to be none other than Gabriel, old Myddelton's supposed murderer. It is also quite in accordance with that view of human nature and human events that he should turn out to be quite a different person. There is some ingenuity in the final working out of the catastrophe, but it is weakly managed. The whole plot in this respect is a misguided attempt at that involution and subsequent disentanglement with which only a few writers such as Gaboriau, Wilkie Collins, and in another line Jules Verne, have been competent to deal. The construction of elaborate plots seems to be an art by itself. It is unfortunately considered by many people to be easy, whereas it is in fact most difficult. A good illustration of this is found in the story of Balzac's engaging a young man to make plots for him. This young man was in the position of many young men—that is, he was both destitute and clever; and he naturally hailed with delight Balzac's offer of a comfortable competence in return for the manufacture of plots. His engagement was, however, broken by himself after two nights, during which he was incessantly waked up by demands for a plot which he was unable to satisfy. The writer of *Old Myddelton's Money* would do well to remember this story. She makes a remark which has some truth in the course of her first volume:—

In each of us lurks some vein of true genius. Though sometimes so slight that, in the gloom of unappreciation, or the glory of a greater light, it is not seen, the golden thread is pretty sure to be there.

The vein which lurks in *Old Myddelton's Money* can scarcely be called true genius. There is, however, enough cleverness shown in the working out of Mrs. Payte's character to make one regret that it has not been used to better purpose.

HOLDSWORTH'S DEEP-SEA FISHING.*

A LARGE amount of official work as Secretary to the Royal Deep-Sea Fisheries Commission, whose Report was laid before Parliament early in 1866, supplied Mr. Holdsworth with materials out of which he made an instructive and interesting volume upon the subject of sea-fishing in general, with especial reference to the practical working of the Fishery Acts upon the various stations around the British Islands. The personal visits required by his duties made him familiar with every station of importance, and gave him an experimental knowledge of the various craft and gear severally in use amongst them. The Reports of the Scottish and Irish Fishery Boards have also furnished their quota of facts and figures towards the statistical fulness of Mr. Holdsworth's researches. He might have done more, however, towards tracing the history of the fisherman's craft, its earliest expedients, and its gradual extension from sea to sea. The work of the fisherman is coeval with the history of man upon the earth. The first rude efforts of his intelligence are to be traced in the making of bone and flint into fish-hooks and spears. There are, again, the simple nets left by the lake-dwellers of Switzerland and other haunts of primeval man. Passing from the rudimentary and isolated efforts of man's industry, our author might have given us some outline at least of the progress of legislation in these islands from the beginning of authentic history; the materials for this lie nuply to hand, not only in the Statute-book, but in the charters and archives of our coast towns, not to speak of the multitudinous notices scattered up and down the domestic and archaeological literature of the country. Such a duty is not to be passed by with a cursory reference to the "scarcity of trustworthy materials," nor is the omission atoned for by what Mr. Holdsworth has done to set forth our existing fisheries and all that appertains to them in the fullest detail. To say no more, he would have had his reward in the wider and more varied interest which would have attached to his work, which, as it is, reminds us too much of the dull elaboration and mechanical formality of a Blue-book.

It is surprising in how backward a state the knowledge of the natural history and the habits of fishes has long remained. The spawning of fish, their migrations, and what they feed on are mysteries on which but a faint light has been thrown either by the researches of naturalists or the observations of fishermen. There is extreme difficulty in getting a definite or concurrent expression of opinion upon simple points like these from even the most intelligent men of a class who have all their lives been conversant with fishing whether for livelihood or for sport. There is no order of men who cleave more inveterately to what satisfied their forefathers, or who trouble themselves less with what lies outside the pale of their immediate calling. With the freer locomotion of late years and the stimulus of a growing demand, there has been, our author is glad to notice, a disposition, at the larger stations at least, to adopt improvements in working the fisheries, in studying the best kinds of boats and gear, independently of local or traditional prejudice, and in investigating the causes of fluctuation in the natural supply of our coasts and seas. In considering the present condition of our home fisheries as compared with their state twenty, or even ten, years ago, the most trustworthy method seems to be to compare, on the one hand, the quantity of fish now and formerly brought to market, and, on the other, the amount of capital then and now invested in the fisheries, as indicated by the number and size of the boats employed in them. On neither head are statistics available to the extent or with the certainty that might have been expected. The estimates put forth from time to time by ingenious newspaper Correspondents of the quantity or kinds of fish sold at Billingsgate give but an approximate idea of what is annually disposed of there. The City tolls being paid on the conveyance in bulk, not on the weight of fish delivered, the dues returned are nearly the same whether the contents of a waggon are five packages or fifty. Be the size of a vessel what it may, the toll is taken, Mr. Holdsworth informs us, on either a full or a half cargo, the actual bulk of fish not being more precisely known save to those immediately concerned in the sale, whose interest is not in favour of publicity. Billingsgate, moreover, vast as is the amount of fish brought to it both by sailing and steam carriers as well as by rail, is only one of the important markets which are now supplied direct from the coast. And the quantity annually carried by the railways is only known to the Companies, but few particulars leaking out in the course of the periodical Reports. There is in addition the fish which is consumed where it is landed; though this is not perhaps so much as in former years, before the existing facilities for transport into the interior came into play. Of cured fish there are no better means of getting accurate estimates; for the Scotch Fishery Board, it appears, returns only the number of barrels of herrings cured "wet," having nothing to do with the smoked fish, and the Cornish merchants do not include in their trade circulars the home consumption together with the annual export of pilchards. The main evidence of a large and steady development of consumption is to be found in the immense number of markets all over the country, which now have their regular supplies, in the greatly

increased number and improved class of fishing-boats in use, and, above all, as our author rightly insists, in the fact that, notwithstanding the largely augmented demand for fish in recent years, the prices realized by the producers have not advanced in anything like the same proportion as the prices of beef and mutton. The price to the consumer is another question altogether. Yet even this cannot be said to have advanced quite in the same degree as the price of meat.

Two considerations come in to explain what might here be thought anomalous. The sale of fish, in the first place, has been organized into a regular trade throughout the country by the agency of the railways and the electric telegraph. The wholesale dealers have agents in every direction. The needs of the central market are communicated directly to the coast, and the supply is forthwith despatched, to be again distributed within a few hours from leaving the sea among thousands of retail dealers. Transport and telegraph charges form heavy items in the salesman's expenses. Each person or agency through whose hands the fish passes adds a percentage to the cost, until at last the price charged, especially at West-End shops, is frequently three or four times as much as the fisherman received for it. From a table furnished by a leading trawl-owner of Great Grimsby, showing the weight and value of the fish taken by one of his vessels in each of five consecutive years (1860-64), it appears that prime fish, consisting of turbot, brill, soles, and dory, averaged at that time 2½d. a lb. What is called offal—i.e. plaice, haddock, and other inferior kinds—would bring the fisherman not so much as ½d. per lb., though the quantity of the former, compared with that of the latter, was only as 86 tons to 357. In spite of the enhanced price to the consumer, it is doubtful whether any proportional gain has accrued to the fisherman. A second matter to be taken into account is the great diminution of waste. The fishmonger has no longer the risky trade he had in former years. The introduction of ice has revolutionized his business, however much it may be deplored by the epicure, who was formerly sure of getting none but the freshest of the day's fish, and cared not what price he paid for the delicacy; all that was left over, if not thrown away, coming down to second-rate shops, or the costermonger's barrow. The entire stock, saving such tender wares as herrings and sprats, is now no sooner brought to market than it is thrown into ice. Being thus safe for some days, it is packed and sent hither and thither in ice, and stored in the fishmonger's cellar, who is no longer disquieted by doubts as to the fish unsold to-day being sound and presentable to-morrow. Billingsgate, moreover, must be cleared out day by day, and should the supply be greater than is required by regular London and country customers, the surplus is set free at prices which attract the costermongers, whose barrows become the means of dispersing a vast quantity of fish, often in very good condition, among the poorer neighbourhoods. Nor has Billingsgate, overburdened as it is, anything like a monopoly in the diffusion of the produce of the sea. An immense quantity, our author is able to assert, finds its way, thanks to the agency of the telegraph, direct from the coast to many a market inland. There can be no stronger proof of the great increase in the national supply of fish, and of the fact that the sea-fisheries are not going to ruin, as croakers have told us for years past, than that, notwithstanding the many new and independent centres of business opened of late years, the great market by the river-side is in process of being nearly doubled in area, in order to keep up with the growing expansion of trade.

A question of not less importance in connexion with the prosperity of the sea-fisheries is that which relates to the spawning habits of the several kinds of fish in demand for the table. The study of the habits of the salmon in this respect has been made the basis of most of the legislation which has increased the supply of this favourite fish. Although the protection of deep-sea fish must be far less within our power, a knowledge of the conditions of their spawning may help us towards determining how far the prevalent methods of fishing may be likely to injure the germs of our future supply. On such points the gossip of fishermen is of little or no value. Of far more significance are the observations of naturalists like Professors Huxley and Alhnan, whose evidence as to the fact of living and well developed ova being found floating upon the sea was held to be of much weight by the Commons Irish Fishery Commission in 1867. The most valuable contributions to our knowledge of this obscure subject have been made by the eminent professors Sars, father and son, of Christiania. The reports of these observations, chiefly in the region of the Lofoden Islands, have unfortunately been issued in the Norse language only. But many of the more important results have been communicated by Professor G. O. Sars for the purposes of the present work, and constitute one of the most valuable portions of its contents. The surface net ordinarily used by naturalists for collecting minute floating forms of marine life was the means of gathering abundant masses of the ova of the common cod (*Gadus morhua*) floating on the surface. Examples were found in various stages of development, and the species identified beyond a doubt. The same observations were made on the ova of the haddock (*Gadus aeglefinus*). Nor did this prove to be the case only with the single family of the *gadidae*, as M. Sars was at first inclined to believe; for he subsequently found the same rule to prevail with the mackerel (*Scomber*), and at least four other kinds of fish, among them the gurnard (*Trigla*) and the plaice (*Pleuronectes platessa*), and he considers it to apply beyond doubt to the other *Pleuronectidae* also. There is reason to believe that the actual spawning of the

* *Deep-Sea Fishing and Fishing-Boats: an Account of the Practical Working of the various Fisheries around the British Islands. With Illustrations and Descriptions of the Boats, Nets, and other Gear in Use.* By Edmund W. H. Holdsworth, F.L.S., F.Z.S., &c., late Secretary to the Royal Sea Fisheries Commission. London: Stanford. 1874.

mackerel takes place at the surface, while with the haddock and cod it may occur at the depth which is their usual haunt, the spawn rising to the surface by its lighter specific gravity. In the case of those fishes whose ova are cemented together by a glutinous secretion or fastened in lumps to foreign bodies, such as algae, hydroids, &c., the development may take place at the bottom. Such are the herring (*Clupea*), the capelan (*Osmerus*), the species of *Cottus*, *Liparis*, and others.

The important general conclusion is that, as the most prominent kind of fish taken by our line fishermen and trawlers, and the mackerel amongst those taken by the drift nets, are of the species whose spawn floats upon the surface of the sea, their ova cannot be liable to the slightest injury by any method of fishing which is carried on upon or near the ground. If such be the rule with the spawn of the cod and haddock, there can be little doubt as to its holding good with the ova of ling, coal-fish, whiting, pollack, hake, and torsk (*Bromius*), all belonging to the same family. Nor does it less apply to the group of fishes including turbot, halibut, soles, plaice, dabs, and flounders. Mackerel and gurnards have the same habit, which may, we presume, extend to the dory, closely allied as it is to the mackerel. Nothing is to be said with certainty of the bream (*Sparus*), rod or grey mullet, or conger. On the other hand, the herring spawn is known to adhere to the bottom, and the same rule might have been thought to apply to the pilchard and sprat. But our author does not know it to have been verified in their case, whilst ichthyologists of the repute of the late Mr. Jonathan Couch have found reason to believe that the pilchard spawns at the surface, the ova becoming mixed with a large quantity of tenacious mucus which spreads out and keeps them floating. Startling as the conclusion may appear at first sight, these facts encourage the belief that there is no possibility of destroying by any existing method of sea-fishing the deposited spawn of any of our important edible fishes, with the exception of the herrings. In the case of that fish, moreover, there is no proof of injury being thus caused; trawling being rarely carried on in the few places in which the spawn of the herring is known to be deposited. Infinitely greater mischief is due, as our author remarks, to the universal demand for full-roed herrings, which makes it imperative upon fishermen and curers to secure the "full" fish, each containing ova by hundreds of thousands. Yet, after all, what is to be set down at its utmost stretch to human gourmandizing in comparison with the invasions of flocks of gannets, gulls, and other sea-birds, shoals of cod and ling, and, beyond all, the whales and porpoises whose appearance in the narrow seas is hailed as a sure harbinger of the plentiful take of herrings to follow? There is no analogy at all events to be drawn from the habits of the salmon for a similar close season to be enforced in the case of sea-fisheries. Into the vexed question of the oyster famine, its origin and possible remedies, it has not fallen within our author's scope to enter with any fulness. He does but touch incidentally upon the dredging operations on the Welsh and Irish coasts. In the Fishery Regulations which he has quoted in the appendix he has consequently not included those referring to the oyster fisheries. But he has given a summary of the most important articles relating to the limits of the British fishery grounds, the working of drift and seine nets, the maintenance of order among the fishermen, and the registration and marking of fishing-boats. The main body of the work is taken up with a methodical description of the several modes of sea-fishing, and an enumeration of the various stations on the coasts of the three kingdoms. The statistics here collected form a valuable mass of information, and show from what wide and solid grounds the writer has drawn the conclusions which lead him to look so hopefully upon the prospects of our sea-fisheries.

FURNITURE AT SOUTH KENSINGTON.*

THE handsome volume in which Mr. Pollen has described the Ancient and Modern Furniture in the South Kensington Museum, like those in which a similar service has been rendered to Ivories by Mr. Maskell, to Majolica by Mr. Robinson, and to Textile Fabrics by Dr. Rock, aims at combining two purposes which in some respects might have been better kept apart. It is true that the very full labels affixed to every object in the South Kensington Museum supply the most obvious of the wants which a catalogue is designed to meet. There is no need of referring to a book to know the country or the century to which a cabinet or a mirror is to be attributed. But this only makes it the more easy to provide the student with that kind of information which cannot be conveyed by labels, and which it is yet so useful to have at hand while actually looking at the objects to which it relates. Mr. Pollen's introduction, which already occupies 250 pages, might have been amplified by the incorporation of some of the more general matter which is distributed over the actual catalogue, and would thus have taken its proper place as an essay towards a history of artistic or decorative furniture. The detailed description of the more important articles might then have been printed in a form which could be carried about in the Museum, and referred to

where such descriptions are chiefly valuable—in presence of the things described. If this catalogue had further set out the leading characteristics of the various periods of art, and given—a very essential point at South Kensington—some indication of where the several objects or classes of objects are to be looked for, the collection would have been made very much more useful than it can be now, when the visitor has to choose between burdening himself with a book pot much smaller than a family Bible and carrying Mr. Pollen's descriptions in his head. As it is, the merit of Mr. Pollen's introduction is in danger of being underrated, from the general resemblance of the volume to a catalogue of the contents of a particular collection, while the utility of the catalogue is lost by reason of the bulk and costliness of the volume in which it is contained.

One great use of such a collection of furniture of all countries and periods as is now established at South Kensington is to improve the taste of the present school of cabinet-makers. There has of late years been a very great improvement in the intentions of upholsterers, but as yet it has but seldom extended to their execution. The shop windows are full of chairs, tables, and cabinets which show a commendable desire to get beyond the strangely ugly forms which were supposed twenty years ago to embody the last results of fashionable civilization, but it is rare to see any intelligent purpose either in the design or in the ornamentation. In this respect there can be no change for the better until the proper function of machinery is more clearly understood. There is much of course that used to be done by hand labour which can now be done equally well by some of the many labour-saving expedients which are the fruit of later ingenuity. It would be idle to insist upon having no part of a chair or a chest of drawers made by machinery if, for all the purposes for which chairs or chests of drawers are used, machinery is as good as handwork. But then the question presents itself, what are the purposes for which chairs and chests of drawers are used? So far as chairs are simply meant to sit upon, and chests of drawers to hold clothes, machinery can clearly do all that is required. But, as a matter of fact, neither of them are ever made with no other end in view than this. In the simplest and cheapest work some attention is paid to ornament, while, as soon as the cheapest work is left behind, a great part of the cost of every piece of furniture is made up by additions which are supposed to please the eye, and which in theory would not be made except to please the eye. Here, as a rule, machinery is altogether out of place. As soon as we get beyond mere beauty of curves and lines, ornament requires the brain and the hand of the individual artist. A carving which could be multiplied indefinitely by machinery might reproduce the charm of the original design, but the charm of the original execution would be gone. In furniture, for the most part, design and execution do not bear to be thus separated. It is hard to say whether the grace or fancy which pleases us in the carving of a chair or in the inlaying of a bureau is an attribute of the head or the hand of the workman. The slight repartees of ordinarily clever conversation would lose all their attraction if they were written down and reproduced by an actor. It would be felt that wit which had to be thus separated from its author needs to be of a higher, or, at all events, of a less evanescent, quality than wit which came fresh from the speaker's mind and lips at the same moment. The objection ordinarily made to the exclusion of machine-made ornament from upholstery is the increased costliness which would thereby be imparted to furniture. Certainly any really good piece of modern decorative furniture commands an enormous price; but the conditions under which it is produced fully account for this, and these conditions are not in themselves immutable. Cabinet-makers err at present on the side of over-decoration; consequently, if the work is good, it is necessarily costly from the mere fact of there being so much of it. When a great price is asked the purchaser naturally likes to think that he has his money's worth, and this leads the tradesman to make the material expensive as well as the workmanship. The true principle of furniture ornamentation was much better understood a hundred years ago. For carving in soft wood, says Mr. Pollen, "excellent workmen were found in England for the first three-quarters of the last century." The particular example to which he refers is a chimney-piece front in carved lime-wood, with an illustration from *Aesop's* fables in the centre panel, attributed to the father of Sir Humphry Davy. "Little panels filled with such subjects . . . continued to the end of the century to form the centres of chimney-piece ornament in London houses." In work of this kind there was room for the fancy as well as the skill of the workman to display itself, and yet no very great amount of time was needed to produce it. In the houses lately destroyed to make room for the new Law Courts there were many fragments of architectural carving in deal, some of which are now at South Kensington. As regards furniture, it is a very great loss that this soft wood carving should universally have been superseded by carving in hard wood, "executed and brought to a final surface with labour and very slowly." There is immense variety again in the carving of the mahogany chairs of the last century which go under the generic name of Chippendale, though many of them were made by Sheraton, Heppelwhite, and Lock. Of the latter Mr. Pollen says:—"Some curious memoranda delivered with a collection of his original drawings and those of Chippendale to the great Exhibition of 1862 give the names of his workmen, and interesting particulars respecting wages in 1743. Five shillings per day were then given

* *Ancient and Modern Furniture and Woodwork in the South Kensington Museum.* Described, with an Introduction, by John Hungerford Pollen. London: Chapman & Hall. 1874.

to wood-carvers. Lock belonged to and left behind a race of wood-carvers and wood-workers." It is to be wished that the Museum were richer in English work of this particular period. It has been overshadowed by the French work of the same century; but, beautiful as Riesener marquetry is, for the purposes of our own workmen there is as much to be learnt from the carved work of the same date in England.

At the same time inlaying in coloured woods is an art which well deserves more attention than has of late been paid to it. Perhaps no kind of furniture has been more vulgarized. Everybody knows the walnut-wood cabinets or chiffonniers, with a few narrow curved lines in black or white wandering meaninglessly over the panels, which are so common in modern drawing-rooms, and which pass among upholsterers under the name of marquetry, or the polished black tables covered with inlaying in which a white composition does duty for ivory, and is supposed to make the whole a reproduction of Venetian furniture. Before these monstrosities could have become popular the true theory of inlaying must have been forgotten. Mr. Pollen gives an interesting sketch of the history of marquetry. Its introduction into Europe is attributed to the Venetians. Their merchants found a manufacture of geometric marquetry in ivory upon walnut-wood existing in the East, and the specimens they brought back with them seem to have been the parents of Certosina work, so called, though without any known reason, from the great Carthusian monastery between Milan and Pavia. The general characteristic of this work is the use of lozenge-shaped dies formed into stars or circles. The Museum contains a set of four chairs decorated in this style, made about 1550, for Guidobaldo II., Duke of Urbino. From Certosina work were developed the figure and landscape designs which are to be seen in the Cathedral of Pisa and other Italian churches. There is a fine example of Tarsia in the Museum, consisting of a panel with a seated female figure inlaid in it. "The background is rosewood, and the dress, face, &c., as it were, painted by the dexterous use of the different directions of the grain of the pine-wood of which the figure is made. The grain is so managed and counterpoised as to give flowing, natural lines that follow the sinuosities of the design as the strokes might do of an artist's brush, feeling the form as he paints in the colours." Inferior artists preferred buildings to figures as subjects, as a kind of rude perspective could be easily attained by judicious arrangement of light and dark woods. This landscape marquetry became very popular in France. The fault of it as a style is that to be good it must be very good. If it falls short of real artistic excellence it is stiff and unnatural, without rising to the dignity of being grotesque. The full development of wood marquetry in France was postponed for a century by the interposition of Boulle, who was employed in furnishing the palace of Versailles and invented the marquetry in tortoiseshell and brass which has since gone by his name. Under Louis XVI. marquetry proper again became popular, and reached perhaps its highest point as regards domestic furniture in the work of Riesener and David Roetgen. The former was cabinet-maker or *ébéniste* to Marie Antoinette, the latter was also employed about the Court of Louis XVI. Roetgen's work is in lighter woods, and has a somewhat gayer tone than Riesener's. Both, however, confined themselves to the delicate tones obtained by the use of natural wood, tinted with various shades by the application of hot sand. In this way various shades of red and yellow were obtained, and green ebony furnished a colour, approaching more nearly to brown than to green, which was much used for foliage. Brighter shades of green as well as blue can be had by steeping white woods in various chemical solutions. But very great brightness is usually a note of inferior marquetry. This holds good only of the colour of the woods employed, since the general effect of excessive brightness may be due to fresh varnish. Mr. Pollen has not been able to collect any information about Dutch marquetry, which is interesting on two grounds—as the parent of English marquetry, and as the kind which is most imitated at the present moment. A great deal of this kind of furniture was imported into England after the revolution of 1688, and it was at once copied by English workmen. The details of Dutch marquetry have rarely much that is artistic about them. The effect is due to the subdued glow of colour produced by tulips, birds, and foliage all in the natural colour of the woods used. What has just been said about bright colours applies especially to Dutch marquetry. There are a great number of pieces now to be seen in the dealers' shops, which are perfect rainbows in the number, though not in the gradation or arrangement, of the colours used. Much of this furniture is altogether new, and in the remainder new inlaying has probably been added to old groundwork.

In taking leave of Mr. Pollen's book, we heartily wish him time and opportunity to enlarge it. As a first attempt to collect the scanty and scattered information which exists on the subject of furniture it deserves high praise. We must repeat, however, the expression of our hope that in future editions the original part of the work may be separated from that which belongs more strictly to a catalogue. The former can already afford to stand alone, and when standing alone is more likely to bring in to its author the corrections and additions which he indicates his desire to be supplied with.

HILDA AND I.*

MRS. HARTLEY'S name is new to us as a writer of fiction, but if this is her first venture we have little hesitation in pronouncing it hopeful. Her story is naturally told, and her style is easy, lively, and correct. It relates to a fair and wealthy ward in Chancery, and treats of, though we should say it rather underrates, the perils which environ guardians and wooers if they trifle with such blooming but forbidden fruit. Hilda Dalrymple is the ward, and the writer of the story is her guardian, Mrs. Hamilton of Frankley Manor. Whether the Court made a wise selection is a point on which readers will form their own opinion, but there is certainly something amusing in Mrs. Hamilton's admission of acts of weakness and lingering predilections, to say nothing of the conflicting feelings which disturb the bosom of a woman whose first marriage was unhappy, and who is still young enough to be of possible account in the matrimonial market. Although Hilda gave no real cause for jealousy, complications and misconceptions arose out of the charge of a young relative "almost too beautiful for an heiress." The gist of the story is the wooing and almost winning of Hilda by a Coastguard officer, Captain Percy Nugent, a low-bred, scampish adventurer, whose suit is all the more successful because Mrs. Hamilton warns the heiress against him, although she stops short of the decisive step of forbidding him her house, which his advances at the first meeting would certainly have justified. Another of the characters is the Rev. Lionel Belmore, a model parson, single, and interesting on account of a long-past disappointment; and the devotion of Mrs. Hamilton to his schools, services, words, and wishes springs at least as much from "a subtle spirit of man worship" as from religious motive or womanly charity. This Mr. Belmore the heiress begins by quizzing and teasing; but as there are some people who rather like to be teased by a pretty woman, we are not surprised when Mrs. Hamilton is rendered jealous by the discovery that he is wholly enslaved to her cousin, who not the less cherishes her blind fancy for Nugent, and shuts her ears to damaging rumours as to his character and circumstances. Meanwhile the author introduces an amusing hyplay in the attentions of Lord Charles Langton, second son of the Duke of Ashburton, which are meant for the widow, but are somewhat perversely mistaken by her for attentions to the ward. Her wish was doubtless father to the thought, for such a match "the Court" would have approved; but Lord Charles has no eyes for Hilda, and amuses himself with his sister-in-law's governess, Marion Bruce, "pour passer le temps," until such time as Mrs. Hamilton will vouchsafe him "yes or no." While the chief actors are thus at cross purposes—Mr. Belmore sighing for the heiress, Mrs. Hamilton for Mr. Belmore, and Lord Charles in his easy way seeking, if not sighing for, Mrs. Hamilton—Percy Nugent is winding his meshes around Hilda, whose consent he has clandestinely gained and whom he only waits for an opportunity to carry off. The only excuses for Mrs. Hamilton's lack of vigilance and infirmity of purpose as a guardian are her secret passion for the unreciprocative Belmore, and the sudden death from an accident, out riding, of her bright and spirited boy, which withdraws her for a season from the observation of the world. Her retirement is ere long broken in upon by a solicitor employed by the Court, Mr. Cleaseman of Lincoln's Inn, who winds up an interview in which there are frequent threats of forfeiture of recognizances, with a warning that should she not endeavour by removing the heiress from Nugent's neighbourhood to prevent an imminent clandestine marriage, she may possibly find herself in serious difficulties. A visit to London, and a presentation at a Drawing Room, are colourable excuses for such a sudden change of scene; but before the plan is put into execution, Mrs. Hamilton on two occasions contrives to play the eavesdropper, in one case overhearing Belmore's avowal of his hopeless passion to Hilda, in the other a more matter-of-fact *tête-à-tête* between Lord Charles and Marion Bruce. Besides this, she intercepts, reads, and burns a note from Hilda to Nugent, indicating very clearly by her action in all these cases, though it is more impulsive than deliberate, the imperfection of her character.

When the characters are transferred to London the plot thickens. The death of Lord Charles's elder brother, Lord Rosetower, leaves him heir to a dukedom, and enables him to make a formal proposition to Mrs. Hamilton, hitherto at cross-purposes as to his intentions. Unhappily the town proves a better field than the country for Nugent's plans; and, despite the vigilance of detectives who dog him at the Opera, in the Parks, and elsewhere, he induces Hilda to slip out, on a Sunday morning, in her chaperon's absence, and when she is supposed to be confined to her room, to a neighbouring church, where they are quietly married. Before, however, she can compass an elopement, and whilst she is still an inmate of Mrs. Hamilton's house in Park Lane, Mr. Cleaseman and a Master in Chancery interpose. The heiress is removed to the Master's country house, and Mrs. Hamilton is relieved of a trust in which, tried and weighed in Chancery balances, she had been found egregiously wanting. Rumours too are afloat that the Captain has a wife already, and is in peril of apprehension on a charge of bigamy. That he is secretly married to Hilda Mrs. Hamilton is

* *Hilda and I*. A Novel. By Mrs. Hartley. 2 vols. London: Samuel Tinsley. 1874.

pretty fully convinced, when, on a sudden, she is summoned to the Master's country house to nurse her cousin after an accident which has arisen out of an attempt at elopement. In her dealings with Mr. Stanley, the Master in Chancery, in reference to a certain casket, Mrs. Hamilton's conduct does not impress us with a high estimate of her straightforwardness; but it would seem as if, like a schoolboy with an Argus-eyed master, she deemed a lawyer sharp enough to take care of himself. Hilda is incautiously allowed by Mr. Stanley to return to Frankley, Mrs. Hamilton's country house; and Mr. Belmore, with more wilfulness than wisdom, assists the heiress to escape whilst Mrs. Hamilton is absent in town, this time on the errand of the Court of Chancery, and for the purpose of seeing the first and real wife of Percy Nugent, the neglected victim of an early *mésalliance*. Belmore accompanies Hilda to Dover, where she is to meet her husband, though not till after the departure of her travelling companion. Great is the mutual shock when Mrs. Hamilton communicates to the latter the fact of a previous marriage, and when Belmore confesses his part in bringing Nugent and Hilda together. Here, however, the Court of Chancery intervenes. Nugent is apprehended as a bigamist, whilst poor Hilda presses on alone to Boulogne, where she is found and nursed in brain-fever by a lady who takes compassion on her, and is afterwards brought home, shattered and sinking, to Frankley. Henceforth the course is all down hill. Nugent's trial breaks down by reason of his tampering with witnesses who might have sworn to his first marriage. After an adjournment for further evidence, he is acquitted because none is forthcoming. But he gains little thereby, as he is committed to prison for contempt, "there to remain until he can make a settlement on the ward, proportionate to her fortune." This is of course a crushing blow to the still sanguine "wife and no wife," who had believed a vagabond when "he said we were to go abroad and remain there quietly a little while, and then, if they found us, we must just go back and appear before the Lord Chancellor, and cry a little, and be rather penitent, and very much threatened and not the least alarmed—for no real fuss would be made." Nevertheless, she still clings to her Percy, whose true wife at this point dies somewhat tragically out of the way, and, though gradually fading away, she refuses to be disenchanted, until at last her idol writes a letter which leaves no room for faith or hope. The wretched fellow has got sick of durance, and purged himself of contempt by consenting to give her up. After this, her only resource is, of course, to die. She sinks rapidly, despite the solicitude of Mr. Belmore, the novelty of an Indian cousin's return, and the self-accusing tenderness of the mistress of Frankley. What becomes of the latter we shall not tell. The reader will discover from a satisfactory last chapter whether she still pursues her worship of the somewhat priggish Belmore, or takes compassion on the persevering Marquis of Rosetower. Mrs. Hamilton's weakness and folly make her perhaps all the more natural as a character of real life. Most of the complications of the story certainly could not have arisen had she been less irresolute and preoccupied by selfish considerations; had she, in fact, loyally discharged the duties of a guardian. It cannot be denied that, owing perhaps to some secret sympathy, Mrs. Hamilton fares too well in the issue, and escapes too lightly, with two or three scoldings from the Master, for derelictions of duty which she herself expected would receive severer punishment. Perhaps in the mind of the author, her boy's death in the first volume—otherwise inartistic and needless—is introduced in palliation of her neglect of trust; and indeed the loneliness to which she is reduced, till a *deus ex machina* arises in the last chapter, might seem a partial retribution. As to Nugent, he contrived to evade the penalties of his guilt; but it would be rash for any one who might be seized with a desire to imitate his conduct to adopt the ingenious theory "that if he proved his first marriage, the second, contracted during his wife's lifetime, must be void, and that he could no longer be detained in prison for being the husband of the ward in Chancery when that marriage was shown to be invalid."

Apart from the details of the plot, Mrs. Hartley is evidently a lively observer of people and manners, and has a droll easy way of putting things when they strike her. The host at a croquet party who talks over the affairs of the nation with a few other veterans to pass away the time, "secretly bemoaning the loss of his usually comfortable dinner, and thinking grapes and apricots, lemonade and claret cup, tea and bread-and-butter, a very poor substitute," is a portrait which all must have seen. Hilda's criticism of Lord Charles, "I couldn't help thinking all the time that, dressed as a farmer, he looks like a gentleman; and dressed like a gentleman, he looks like a farmer," would apply to many a country squire. Most readers will enjoy a gossiping Mrs. Wilkinson's account of Lady Rosetower's antecedents and parentage. "She was a Jones, and not a very good Jones either." There is also humour in the description of a Lawn Meet at Rendlestone. After a great part of the day has been consumed in playing at fox-hunting for the sake of the sightseers, an old farmer rides up to Lord Charles, and says with a wink, "Ayn't it very near time to see a little sport, my Lord? We've had about *prommynnyng* enough for the ladies." Mr. Belmore, portrayed as a tolerably manly pet parson, with what Mrs. Hamilton calls "a somewhat pontifical manner," afterwards develops into a romantic lover. The drive to Miss Wilkinson's wedding affords scope for a description of nice open weather and "a hunting morning" in late winter, which bespeaks a practised eye for scenery. Indeed we never like Mrs. Hartley

better than when she indulges in these country pictures, though she shows herself by no means a novice when she depicts town life and the more artificial world.

CHRISTMAS BOOKS.

I.

SINCE the days when the priest and the barber held a public inquisition on the books of the renowned Knight Don Quixote de la Mancha, we doubt whether there can be found anything at all comparable to the inquisition which, as each winter comes on, we find ourselves called upon to hold on the Christmas books of the year. In one mood, we feel like the Knight's housekeeper and niece, and think that it would be better to throw them all out of the window into the courtyard, and set fire to them in a heap. In another and a gentler mood, we think with the priest that it would be as well to take the books one by one and see what they treat of, for perhaps some may be found that do not deserve to be chastised by fire. Then prudence steps in and warns us, as it did the housekeeper, that if we once meddle with them, some enchanter of the many with whom these books abound may exercise his art upon us, and lead us next year to write a Christmas book ourselves. But then with the priest we find ourselves smiling at the simplicity of the notion. We might just as well be afraid of tasting mince-pies lest they should tempt us to turn cook as be afraid of reading Christmas books lest they should tempt us to turn author. Then, too, we know that in this great pile of books we shall find many an old favourite, and we can say with the priest, "We should have shed tears ourselves had we ordered them to be burnt." While, however, we gladly spare the old stories which have delighted us so long, yet "the virtues of the father shall not avail the son," nor because we love the genuine fairy tales shall we therefore show any mercy to their bastard children. Nor, again, shall we allow a religious title and a tract-like story to atone for the ignorance of the author, for, as the proverb says, "the devil lurks behind the cross." Some authors will be found, if not deserving of praise, yet too good for the flames. These shall have the benefit of transportation for one year, and as they show signs of amendment, they shall next Christmas be treated with mercy or justice. We fear that before we have got to the end of our task we may, like the priest, have grown tired of looking over so many books. We will however in that case be more merciful than he, and will consign them, inside and contents unknown, not to the flames, but to obscurity. Now and then it will happen, we fear, that some meritorious young writer will escape our notice amidst the pile of rubbish that is always left at the end of our task. We can only console him by the reflection that in him will be fulfilled the saying "that a saint may sometimes suffer for a sinner." We are happier in our inquisition than were the priest and barber in theirs, in that we come to it with no ill-will towards the books. If they are to turn the heads of half the children in England, their heads at all events are not yet turned. It happens most fortunately for the writers of these Christmas stories that at the very time the young people are reading them they are being feasted on mince-pies and plum-puddings. If their heads get overheated and their imaginations over-excited, it is the cook and not the author who bears all the blame. But it is not only on books of fancy for the young that we have to pronounce our solemn judgment. We have at the same time to hold a court over those elegant works which are in the first place made to sell, and in the second place to give away. As long as there is marrying and giving in marriage, so long does it seem likely that presents will be made. We could conceive that the age may come when a young couple would rather on starting in life receive a barrel or two of ale or an order on a butcher for a small Sunday sirloin of beef for the first few months than one of these illustrated gift-books. We are a long way off from such an age at present, and it is our duty therefore, having the gift-books of the year before us, to do our best to help the unfortunate giver towards making the best selection he can. As it is not we, but the brides and bridegrooms of the next year, who are to receive the presents, we shall do our best to bring down our critical faculties to a level with theirs, and in judging each book we shall think not so much what we, as what they, would like.

Travels in South America, by Paul Marcoy. Illustrated by five hundred and twenty-five engravings on wood, drawn by E. Riou, and ten maps from drawings by the Author. (2 vols. London: Blackie and Son).—We have here in a cheaper, but still in a handsome, edition Mr. Marcoy's *Travels in South America* from the Pacific to the Atlantic. The narrative is lively and interesting, though it is much to be wished that the translator had been more successful in concealing the fact that it is a translation and not an original work. In every page we come across such passages as "a population decimated by the exigencies caused by spiritual power and political revolution," or "those long-drawn sighs which relieve collectively the bosom of the public." The engravings fortunately have no need of translation, and they are as interesting as they are abundant. In p. 324 of the second volume, by the way, is given an exciting account, illustrated by a scarcely less exciting picture, of a fight between a jaguar and a descendant of the Amazons. The jaguar has sprung into a boat and struck down the Amazon's husband, while she is defending him with a spear. Mr. Marcoy says that the animal "ultimately succumbed

to impalement and asphyxia," though whether the husband recovered he has no knowledge. If he has any anxiety on this point, all he has to do is to turn to Mr. Kingston's *Banks of the Amazon*, which was published three years ago, where in p. 392 he will find exactly the same picture and the same incident. The wounded man, he will find, was well looked after and did not succumb like the jaguar. If he looks carefully through Mr. Kingston's book, he will find that other pictures and other incidents are repeated.

The Amazon and Madeira Rivers: Sketches and Descriptions from the Note-book of an Explorer, by Franz Keller, Engineer. With sixty-eight illustrations on wood. (Chapman and Hall).—Mr. Keller was commissioned by the Brazilian Government, as he tells us in the preface to his very instructive work, "to explore the Madeira River, and to project a railway along its bank where, by reason of the rapids, navigation was rendered impossible." He has given us in a concise form the results of his explorations so far as they would be interesting to the general reader. His narrative is adorned by a large number of carefully drawn illustrations. We hope that the Brazilian Government was as fortunate in having Mr. Keller for their engineer as we deem ourselves fortunate in having him as the explorer of a country which is still so little known.

Trespassers. By the Rev. J. G. Wood, M.A., F.L.S. With numerous illustrations. (Seeley, Jackson, and Halliday).—Mr. Wood has added one more to the interesting series of works which he had already published on Natural History. The *Trespassers* of whom he has to tell in the present book are the various inhabitants of earth, air, and water that do not keep to their own proper domains. "It has been my endeavour," he says, "to show how simple, and yet how effectual, are the modifications of structure by which a mammal, ordinarily an inhabitant of earth, is enabled to trespass upon the domains of the fishes and the birds—a bird or reptile to trespass upon the realm which belongs to the fishes, and a fish to trespass upon that of the mammal." Mr. Wood writes in a simple, clear style, and seems to be thoroughly at home with his subject. He never disgusts his readers by condescension, nor worries them with explaining at great length what was already clear. His book can be read by old as well as by young.

As a companion to this work we have a Selection from Mr. Wood's Articles on Practical Natural History, under the title of *Out of Doors* (Longmans). When we say that two of these essays were written for the *Daily Telegraph*, and nevertheless are well written, we have said enough to show our high opinion of Mr. Wood's power to execute a difficult task.

The Complete Angler, by Izaak Walton (Chatto and Windus).—Among the reprints of the year few will be more welcome than this edition of *The Complete Angler*, with Sir Harris Nicolas's Memoirs and Notes, and Stothard and Inskipp's illustrations. From the beginning of the first day when Piscator "stretched his legs up Tottenham Hill to overtake" Venator and Auceps, to the close of the last day when he invoked "the blessing of St. Peter's Master upon all that are lovers of virtue; and dare trust in his providence; and be quiet; and go a-angling," how fresh and how pleasant is the talk of this old lover of the gentle craft! Though the plates of the engravings are of course somewhat worn, yet they are still very interesting.

The Bavarian Highlands and the Salzammergut (Chapman and Hall).—This work—a translation of the German from H. Schuid and K. Stieler—while it is interesting in itself, will also be found very useful by those who intend to make a tour in the Bavarian Highlands. A tourist in a country that is new to him often finds towards the close of his trip that he has missed those very spots in which he would have found most pleasure. With such a work as this before him, and with the help of a good map too, he can make such a pleasant and careful study of the district that when his summer vacation has at length come he will have a well-planned tour before him. The days of touring, however, for some are already past, for others will never come. In the illustrations of this handsome volume, which are both abundant and good, will be found much to interest stay-at-home folks.

From Messrs. Chatto and Windus we have two handsome volumes of engravings. The larger one, entitled the *National Gallery*, contains a selection from some of the chief masters represented in our great collection. In the smaller work, under the name of *Beautiful Pictures by British Artists*, we have "a gathering of Favourites from our Picture Galleries, with Notices of the Artists and of their Pictures, by Sydney Arncliffe, M.A." In this latter collection the frontispiece is after a picture by Mr. Horsley. The numerous admirers of that modern artist will doubtless think none the worse of a volume in which the place of honour is given to one of their favourite artists. We ourselves are inclined to prefer the other collection, though in it there is no artist represented of so modern a date as Mr. Horsley, and though, as might be expected in the second edition of a book of engravings, the lines do not come out very clear and sharp.

The Little Lane Prince, by the Author of "John Halifax, Gentleman." With twenty-four illustrations by J. McL. Ralston (Daldy, Isbister, and Co.).—This is a very pretty story, and told in the writer's best style, with much simplicity and much animation. It is happily free from that excessive sentimentality into which the author of *John Halifax* had of late fallen. It is interesting in itself, and it contains moreover a puzzle which it will pleasantly

task the young readers to unravel. Mr. Ralston's illustrations are not unworthy of the story.

The Will-o'-the-Wisp, by Marie Petersen (Simpkin, Marshall, and Co.).—We have in this little book the translation of a very pretty fanciful German story. The translator has done her work well. It is the printer, no doubt, who is at fault when a lad is represented as walking "along the wheat-field and through the hosiery" (*sic*).

The House on Wheels (Sampson Low and Co.).—This pretty little story is a translation by Mr. d'Auvers from the French of Mme. de Stolz. Young folks will like it, as it is pleasantly written and contains the adventures of a stolen boy who, after long wanderings among the gipsies, at last gets safe home again.

A Manual of Precious Stones and Antique Gems, by Hodder M. Westropp (Sampson Low and Co.).—In this handy little volume will be found much interesting information. Mr. Westropp in a brief preface justifies the taste for precious stones. He starts with "Alexander the Great, who was a great patron of the glyptic art displayed in them," and, taking a rapid survey of ancient history in less than twenty lines, brings his readers down to modern times, where "we find the Medici, Frederick the Great, Winkelmann, Goethe, Visconti devoting their attention to this exquisite branch of art." We would remark, by the way, that Nubius, the Roman Senator "who was content to suffer proscription and exile rather than give up to Antonius a priceless opal which he possessed," was not one of "the Romans in the time of Pliny."

Earth and its Treasures, by Arthur Mangin. Edited, and with additions, by W. H. Davenport Adams. (Nelson and Sons).—This book to a certain extent covers the same ground as Mr. Westropp's Manual. As, however, it takes in more subjects, so it does not enter into such detail in the part where it treats of precious stones. There is not in all points that agreement between the two works which we should expect in treatises that are to a certain extent scientific. The Koh-i-noor, according to Mr. Mangin, was cut by M. Coster of Amsterdam, and now weighs 122½ carats. According to Mr. Westropp, it was cut "by two workmen from the great atelier of Mr. Foster of Amsterdam, and weighs 103½ carats." Mr. Adams should have been careful to give in all cases the English equivalent for French measures. His readers will be puzzled when they read that "a cubic line (*sic*) of *calcaire grossier* will include about ninety-six of these animalcules." The book, however, contains a good deal of interesting matter.

Speaking Likenesses, by Christine Rossetti. With pictures thereof by Arthur Hughes. (Macmillan and Co.).—We cannot say very much for Miss Rossetti's stories. They are not particularly good in themselves, reminding us overmuch of *Alice in Wonderland*, and they are sadly spoilt by the comments of some supposed listeners. Stories or no stories, however, Mr. Arthur Hughes's illustrations are always pleasant to see. He must have a feeble imagination indeed who cannot out of each graceful and fanciful illustration make a story for himself.

River Legends; or, Father Thames and Father Rhine, with illustrations by Gustave Doré, and *Whispers from Fairyland*, by the Right Hon. E. H. Knatchbull-Hugessen, M.P. (Daldy, Isbister, and Co.).—The latter of these stories Mr. Knatchbull-Hugessen dedicates to the Mothers of England, whom, it would seem, he has generally pleased. The boys of England most certainly, unless they are greatly changed for the worse, will not care much for such tales as these; for boys do not like irony, and Mr. Hugessen is ironical. The fathers of England, if any still have a wholesome taste for fairy-stories, by no means relish a lull, and when they can turn to the *Arabian Nights*, are not likely to read either *River Legends* or *Whispers from Fairyland*. The girls of England are not yet, we hope, so utterly corrupted by their brothers and their governesses as to like a mixture of fine words and slang. There is no one therefore left for Mr. Knatchbull-Hugessen but the mothers of England, and to them accordingly he dedicates, as we have already said, his tales.

AMERICAN LITERATURE.

THE tenth volume of Mr. Bancroft's *History of the United States** completes the story of the Revolutionary War. Beginning with the recognition of American independence by France, it comprises the whole period of the struggle after it had passed from the phase of a mere local insurrection of colonists into that of a general conflict extending to all parts of the world; when England, single-handed, found herself confronted by her revolted colonies, by France, Spain, and Holland, while the remaining Powers, one after another, joined that hostile and armed neutrality which, under the leadership of Russia, was watching an opportunity to deal a fatal blow against her maritime supremacy. The theme affords abundant scope to the historian, but we cannot say that Mr. Bancroft shows himself equal to his self-imposed task. Readers who have forgotten, or never were acquainted with, his previous volumes will be tempted by the preface, in which he makes a vast parade of the wealth of materials at his disposal, to form high expectations of the treat before them; but the perusal of a very few pages will suffice to dispel the illusion. It is not merely that the author is bitterly partisan. Partisanship that is blind to

* *History of the United States, from the Discovery of the American Continent*. By George Bancroft. Vol. X. Boston: Little, Brown, & Co. London: Sampson Low & Co.

every good quality in an enemy, and persists in attributing to him the worst motives for every act, is of course to be censured as tending to keep alive international enmities which it is time now to allow to sleep. Still partisanship of this unreasoning kind puts the judicious reader on his guard, and might be condoned in consideration of over-balancing merits. But there are here no such merits. The volume contains not a single eloquent passage to fire the imagination of the reader, or even to present a congruous picture before his mind. The narrative stagnates throughout at a dead level of wearisome mediocrity. Still, in spite of the numerous shortcomings of the author, the volume at least brings out clearly enough the imbecility of the North Administration, and the incapacity of the generals it employed. Remembering what England had achieved in the Seven Years' War, and what she was destined to do in the great contest against Napoleon, it is humiliating to contemplate the depth of degradation to which she was reduced by a wilful and ignorant King and a weak and incompetent Minister. Even on Mr. Bancroft's own showing, and after France had allied herself with the United States, the object of the war might have been attained had there been a Pitt to direct the councils of the country and a Wolfe to carry out his plans. The United States had then no real Government. Whatever Federal authority existed, executive as well as legislative, was vested in Congress. But Congress had no agents, and indeed no power even to levy taxes, while in foreign affairs, in which its competence was largest, the treaties it concluded had to be ratified by the States. It will surprise no one to learn that the ranks of the army were never filled, that its pay was always in arrear, and that its equipments were woefully deficient. Consequently desertion went on on a large scale, and whenever the Royal army showed a little activity, the defence of the colonies devolved to a large extent on the State Militia—a force only casually embodied, and therefore a Yeomanry rather than a Militia. There can be little doubt, therefore, that an enterprising and capable general could have subdued the insurrection. There is another point to be borne in mind, which strongly corroborates this view of the matter. It is that to the very end of the war there was a strong loyalist party in all the States, ready to co-operate with the Royal forces. When Lord Cornwallis invaded the Carolinas, he found no difficulty in raising a "Tory" or loyalist Militia. And the same was the case in the North as well as in the South. The responsibility for the ill conduct of the war rests in the first place upon the Government at home, and more especially upon Lord George Germain, the Secretary of State, to whose department the government of the colonies belonged. In spite of the cloud that rested upon his name, and his great distance from the theatre of war, he was allowed to retain in his own hands the general direction of the military operations, and he frittered away the resources at his command by dividing his forces and sending them on fruitless expeditions. But though the chief blame belongs to Lord G. Germain and the King and Ministers who permitted him to throw away every chance of success, scarcely less blame attaches to the generals employed. Had Howe displayed no more than ordinary activity, he might have turned the American position at Bunker's Hill, and so nipped the rebellion at its birth. In like manner, had Clinton not shut himself up in New York, and persisted in believing, or affecting to believe, that the movements of Washington and Rochambeau indicated an intention to besiege him in that city, he could easily have prevented the investment of Lord Cornwallis's army, and its ultimate surrender. Nor was the conduct of Lord Cornwallis very much better. It is true, indeed, that he would have retired from Virginia when he discovered the impracticability of the task he had undertaken had he not been overruled by Clinton, and even to the last Clinton by the display of a little energy might have relieved him. But on Lord Cornwallis must still rest the responsibility of suggesting the invasion of Virginia while his hold upon the Carolinas was yet insecure, instead of completing the subjugation of the South before moving to a new enterprise.

For some forty years Mr. Greeley was so prominent a figure in American politics, the paper which he founded was for a time so veritable a power in the land, and as a member of the "Albany Regency"—the triumvirate of Weed, Seward, and Greeley—he so largely shaped the policy of the Whig party, that a good biography of the crochety, irascible, impracticable, warm-hearted journalist-politician would not only be very entertaining reading, but would afford a clearer insight than many a formal history into the course of American affairs during the generation when slavery was the great question before the nation. But for such a biography it would be necessary to draw copiously on the correspondence that passed between Mr. Greeley and the other leaders of his day, and still more upon that which passed between him and his confidants. The time, however, has not yet come for the publication of confidential letters. In the meantime Mr. Ingersoll's "Life" * will satisfy the curiosity of those who wish to know something of the personal fortunes of Mr. Greeley, and who are not exacting in respect to literary qualifications.

Mr. Young's Annual Report † is a portly volume of nearly a thousand pages, closely packed with tabular statements relating to the trade and shipping interests of the United States, as well as to the still more important matter of immigration during the year 1873. Besides the usual information contained in such publications regard-

ing exports and imports, transshipments, re-exportation, and home consumption; the number and tonnage of the vessels that entered and cleared from the several ports, both foreign and native; the tonnage on the American register, the number of sailing and steam vessels, and the like, we have elaborate tables showing the number, nationality, age, sex, and previous occupations of the immigrants, the immigrants as distinguished from the passengers, and lastly the emigrants.

The Report of the Auditor-General of Pennsylvania for 1873* we recommend to the study of those who are peculiarly interested in American railways. The State requires every Railway, Canal, Navigation, and Telegraph Company which carries on ever so small a portion of its business within the State to make uniform Reports every year to the Auditor-General, showing the financial condition of the Company generally, and not merely of that part of its business carried on in Pennsylvania. The Auditor-General publishes these Reports, "with tabulated results and comparative statements." The Report before us contains the Reports of 202 Railway Companies, some of them among the greatest in the United States. In many cases only a mere fraction of the line lies within Pennsylvania, yet in every instance we learn the total length of the line, the length open for traffic, the capital of the Company, its liabilities and earnings, and we are also told whether it leases other lines, and how many, as well as whether it has leased out any portion of its own line.

The condition of the prisons, hospitals, and almshouses in the wealthy State of Pennsylvania appears from the Report for last year of the Commissioners of Public Charities † to be in many respects disgraceful. But it is especially in the treatment of "the criminal insane" that there seems to be the greatest need for improvement. The question undoubtedly is not without difficulty, but the system of imprisoning them like ordinary criminals is opposed to common sense and to humanity. The State too has its difficulty, like ourselves, regarding the disposal of neglected children. Many persons who have picked up the notion that the gratuitous instruction of the common schools solves every educational problem will doubtless be surprised to learn that in the large towns of Pennsylvania, as in those of England, a considerable proportion of the boys and girls are growing up without instruction and without care of any kind.

For some years loud complaints have been made along the coast of New England that the supply of sea-fish, once so abundant, was alarmingly decreasing, that an important part of the population was consequently threatened with a loss of livelihood, and at the same time that a valuable article of food was becoming scarce and dear. Investigations into the subject were ordered by the States of Massachusetts and Rhode Island, and the Committees respectively appointed arrived at directly contrary results. The question thus came to assume a party character, and to influence elections. At last Congress took up the matter, and appointed a Commission to inquire into the alleged decrease in the fish supply and its supposed causes. The volume whose title ‡ will be found below contains the first part of the Report of the Commission, and, so far as the South coast of New England is concerned, it confirms the complaints to which we have referred.

Wiley's "Iron Trade Manual" § was originally designed as a guide to the blast furnaces and rolling mills of the United States. It has been extended so as now to present a survey of the existing state of the iron industries in every part of the Union.

Mr. Vose's Manual ¶ aims at supplying the railway engineer as well as the student with a practical treatise on railway construction unencumbered by scientific discussions of disputed problems, and with as little use of mathematical formulae as the case would allow.

The increasing number of technical schools in the United States has suggested to Mr. Warren the preparation of a work on descriptive geometry ¶¶, having the completeness of the treatises of Leroy and Olivier on the subject, which might serve as a first part in the course of such schools.

Mr. W. E. Simonds has collected in a handy volume **, in two parts, all the cases bearing upon letters patent for designs decided in the United States Courts and the United States Patent Office respectively. In two other parts he gives digests of these cases, and in a fifth part he adds comments on the law as thus declared.

Next to hand comes the Report of the Secretary of the Smithsonian Institution††, an institution founded under the will of

* *Annual Report of the Auditor-General of the State of Pennsylvania for the year 1873.* Harrisburg: B. J. Singler. London: Trübner & Co.

† *Annual Report of the Chief of the Bureau of Statistics on the Commerce and Navigation of the United States.* Washington: Government Printing Office. London: Trübner & Co.

James Smithson, an Englishman, who bequeathed all his property to the Government of the United States to found an establishment at Washington "for the increase and diffusion of knowledge amongst men." In accordance with this bequest the Institution endeavours to stimulate original research by publishing works which add something new to our knowledge, and by offering rewards to men of science to undertake original investigations. It also publishes a series of periodical Reports on the progress of the different branches of knowledge. Lastly, in compliance with the instructions of Congress, a library and museum have been added. The total amount received in every form under the will of Smithson up to the beginning of last year was 140,962*l.*, and the annual interest from this fund amounted at the same date to 9,383*l.*

Under the paradoxical title, *America Not Discovered by Columbus**, Mr. Anderson sets out anew the claims of the Norsemen to the first discovery of the New World. Except in the title, Mr. Anderson does not deny the reality of the discovery by Columbus. What he means to say is, that what Columbus effected was a re-discovery of a continent found centuries previously by others.

Mr. Gaskel's† is a posthumous work, which now sees the light under the editorship of a friend to whom it was bequeathed. The author, a firm believer in metaphysics, composed this treatise in the hope of supplying a basis for what alone he regarded as the Science of Mind.

Apart from the great importance which recent events have given to Germany on the Continent of Europe, and her great intellectual pre-eminence, there are reasons why Americans should feel more than ordinary interest in everything German. With the single exception of the Irish, the Germans far outnumber all other foreign immigrants in the United States, and as the Irish immigration has been steadily decreasing for years, while that from Germany has been increasing, it seems not improbable that the German element will acquire greater and greater weight in American affairs. The influence of this fact is abundantly discernible already in a variety of ways. In many of the great towns, for example, German is taught in the common schools, and the study of German history is attracting more and more attention. To the many works of a similar kind, intended for students, Mr. C. T. Lewis has just added a new one‡ founded principally on Dr. Müller's *History of the German People*.

Another work intended to satisfy the same demand is Mrs. Peake's *History of the Sovereigns of the old Holy Roman Empire*.§ And, though dealing with an entirely different subject, Mr. Hart's *German Universities*|| affords yet a further proof of German influence upon the American mind. The work, which is exceedingly well done, is an attempt to convey to those who have not a personal acquaintance with the subject an idea of German University life by a narrative of the author's own studies and experience during a three years' residence at the University of Göttingen.

The author of the *Resources of California*¶ announces himself to be an enthusiast who could not live contentedly elsewhere, and who imagines that neither the earth, the sky, nor the people of any other part of the world equals those of his beloved State. The reader will infer the spirit in which the book is written.

So much has been written of the Pilgrim Fathers that one would suppose the story must be stale by this time even to the genuine New Englander. Apparently, however, it has still an abiding popular interest, for there lies before us a work** which is little more than a repetition of that story, without even the justification of original research, or the pretence of adding new information.

We noticed two or three months ago Mr. Matthews's *Grammar of the Hidatsa*††, with the interesting historical sketch of the tribe by which it was preceded. The author has now supplemented the grammar by the publication of a short dictionary of about twenty pages of the language in question.

We are afraid that the reader who takes up Mr. Codman's narrative of his three months' residence in Utah‡‡ with the hope of being agreeably shocked will be sadly disappointed. The author has evidently conceived a strong liking for Brigham Young; he is ready to record the good qualities of the Mormons generally, he has nothing but admiration for their management of the native Indian tribes before the United States Government interfered in the matter, and he has very little that is sensational to tell. But

he travelled much through the Territory, and narrates his journeyings agreeably enough.

Dr. Clarke's *Sex in Education** is so favourably known that a second work from his pen upon the same subject will be widely welcomed. This later work was undertaken at the special request of the Executive Committee of the National Educational Association of the United States, and was prepared to be read before the Association at its annual Congress last summer. The time allowed for the reading of each paper was, however, so short that the author had to omit the greater part of what he had written; and in consequence he determined to publish the entire paper in book form.

In small compass and handy form Croft's *Transcontinental Guide*† packs together much information respecting the Pacific Railway which will be useful to visitors to California as well as to persons bound for New Zealand, Australia, or the East, who mean to travel *via* San Francisco. It is not necessary, perhaps, to remind the reader that from any of the cities on the Atlantic coast, such as New York or Boston, there are four great main lines to choose between. It is at Omaha, on the Missouri, that the Pacific Railway, properly so-called, begins. The line thence belongs to two Companies—the Union Pacific, which owns it from Omaha to Ogden, and the Central Pacific, which owns it thence to San Francisco. The Union Pacific is by far the longer line, and, we believe, hopes to continue its road to the Pacific Ocean. Croft's Guide presents the reader with a brief but sufficiently comprehensive history of the construction of these two lines and their branches, with notices of the various stations on the way, the forts erected by the Government for protection against the Indians, the lakes and mountain scenery, and it is accompanied by a number of photographic views. The handy little volume also contains a time and fare table, a map of the railway, and a larger map of the world, showing the connexion formed by the line between Europe, on the one hand, and Japan, China, India, and Australasia, on the other.

Hitherto Americans, true to their English parentage, have been disposed to regard art as beneath the notice of a practical people who had a continent to reclaim, and a place to win for themselves in the world. It is true, indeed, that wealthy Americans are foremost bidders at all art sales, just as they give fabulous prices for rare editions of old books. But this readiness to expend large sums too often, it is to be feared, proceeds less from taste for art or profound scholarship than from vulgar ostentation. At any rate, the cultivation of art, whether in theory or practice, has been but little pursued, while until recently art museums have been almost universally wanting. In this respect, however, as in so many others, German influence is beginning to make itself felt, and lectures upon art are now delivered at some of the colleges. There lies upon our table as we write a collection of the lectures‡ delivered by the late Professor of Moral and Intellectual Philosophy at the University of Vermont upon fine art. The method of the lectures is historical, and we are told in the preface that they were received with much favour by those to whom they were addressed.

We may conclude with a reference to the magazines§ whose titles will be found below. With the single exception of *Old and New* for September, none of them contain a paper deserving of special mention. In *Old and New* for September, however, we find two articles which treat of two of the causes which have just led to the defeat of the Republican party. In the first the writer endeavours to arouse indignation against the manner in which the arbitrary revenue laws have of late been worked for the enrichment of spies and officials. The second is a protest against the pretension of "caucuses" and "conventions" to override the judgment and conscience of individuals so as to pervert party discipline into a means of perpetuating an odious and corrupt misgovernment.

MALVERN COLLEGE.

This College contains two Departments—the CLASSICAL and the MODERN. There is also a preparatory LOWER SCHOOL.

There are Boarding-Houses within the College Grounds, held by the Head-Master and others of his Staff; a Gymnasium, &c.

Board and Tuition under Fourteen, £20; over Fourteen, £20. Non-Shareholders pay an extra Fee of 5s. Special advantages for Sons of Clergymen and Home Boarders.

For further information, apply to the Rev. ARTHUR FARRER, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

The Examination for Scholarships and Exhibitions on December 23 and 24.

MALVERN COLLEGE.

The ANNUAL EXAMINATION for SCHOLARSHIPS and EXHIBITIONS will be held on December 23 and 24. There will be awarded Six House Scholarships of £20, Four Founders' Scholarships of £20, and some Exhibitions of £20. The Awards will be for one, or for two years, according to merit, in Classics or Mathematics. For particulars apply to the HEAD-MASTER.

ELIZABETH COLLEGE, GUERNSEY.

Further—The BISHOP OF WINCHESTER.

Valuable University Scholarships and College Exhibitions for annual competition. Special attention paid to Modern Languages and the Preparation of Candidates for Woolwich, Cooper's Hill, Central Department, Army and Navy, and Civil Service.

SCHOLARSHIPS.—An ELECTION to FOUR ENTRANCE SCHOLARSHIPS. Two of £20 a year. One of £20, and One of £20, will be held on Wednesday, April 21, 1875. Apply to the BISHOP, Rectory College, Aldington.

KING'S COLLEGE, LONDON.—The Rev. ALEX. J. D. DORSEY B.D., Lecturer on PUBLIC READING and SPEAKING, gives PRIVATE LESSONS to Members of Parliament, Barristers, Clergymen, and others, at 13 Prince's Square, Bedford Row.

ABINGDON SCHOOL (Six miles from Oxford).—An Old Foundation, with University Scholarships, having new Buildings and extensive Grounds. There are Classical and Modern schools, and a Public School, training is given on moderate terms.—For particulars, and admission in January, apply to Rev. E. SHERWELL, Head-Master.

EDUCATION for BOYS, free alike from Clerical and Dissenting influences, in the Family of a Layman, a CAMBRIDGE M.A. of much Experience. A very light to London. Terms high. Address, TROSBERT, Messrs. Kirby & Emden, Publishers and Booksellers, 100 Oxford Street.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. (Scholar).—Given, assisted by a Cambridge Honour-Man and other competent Teachers, prepares for the Universities and for all Competitive Examinations. Pupils successful at the last Four Examinations for First Appointments. Vacancies at Christmas.

PRIVATE TUTOR or ASSISTANT-MASTER in a PUBLIC SCHOOL.—An OXFORD GRADUATE is DISENGAGED. Seven years' experience. Very high recommendations.—Address, F. S. A. care of Messrs. Robinson, 30 Long Acre, W.C.

HEAD MASTER.—The GOVERNORS of QUEEN ELIZABETH'S GRAMMAR SCHOOL, at Barnet, Herts., will proceed to the election of a HEAD-MASTER shortly before Christmas. The School has been reconstituted under a scheme of the Endowed Schools Commissioners. New Class Rooms and a Master's Lodge have been added and will be ready for occupation at Easter. The scheme provides a Public School for 250 Boys, in two Departments, an Upper and a Lower, both under the Head-Master.

The Head-Master must be a Graduate of some University within the British Empire. He must not be in Holy Orders. Subject to the provisions of the scheme he will control the whole organization and management of the School, together with the Appointment and Dismissal of the Assistant-Masters. He will receive, in addition to a Capital Fee of £3,000 for each Boy in the Upper and £1,000 for each Boy in the Lower School, a fixed Stipend of £250 for the first year, £350 the second year, and £400 thereafter. The subjects of instruction include Latin, Mathematics, French, and Languages, &c. Candidates are requested to send in their applications, stating Age, Degree, and all other particulars, with Testimonials, to the Rev. R. R. DILLON, Rectory, Barnet, the Hon. Secy, on or before Saturday, December 12, 1874.

HEAD-MASTERSHIP.—BEDFORDSHIRE MIDDLE-CLASS PUBLIC SCHOOL COMPANY, LIMITED.

Mr. EDWARD ELLIS MORRIS, M.A. of Lincoln College, Oxford, the Head-Master, has tendered his Resignation on receiving the Appointment of Head-Master of the Grammar School, Melbourne, Australia. The Directors therefore REQUISITE a HEAD-MASTERSHIP.

The School, which is in the Parish of Kempston, and within a mile of Bedford, is fitted for 300 Boarders, and has at present 295.

Candidates to communicate with the SECRETARY, and furnish copies of their Testimonials on or before Monday, December 11, next.

Candidates must not be above Forty years of age. Salary £200 per annum, and a Capital Fee of £1 for every Boy over the number of 150.

Residence of Mr. Morris, and Terms.—THOS. W. TURNLEY, Secretary, 11 Grafton Street, Bedford, Beds.

WANTED, a HEAD-MISTRESS for the NORWICH HIGH SCHOOL.

SCHOOL for GIRLS, of the Girls Public Day School Company, Limited, Salary £250 per annum, with Capital Fee.—Apply, with copies of Testimonials, before December 14, to the SECRETARY, 112 Brompton Road, S.W.

HOME in a COUNTRY PARSONAGE offered to a

YOUNG LADY, Domesticated, Musical, who will assist in the Family of a Clergyman recently widowed. No Salary.—Address, Rev. L. T. St. Matthew's Vicarage, Newington, S.E.

EXTENSION of UNIVERSITY, EDINBURGH.—His Royal

Highness the Duke of EDINBURGH will preside at a MEETING in Willie's Rooms on Monday, December 7 at Three P.M. for the purpose of providing New Buildings to meet the Wants of the University of Edinburgh, occasioned by its rapid growth and the necessity of developing its Museum for practical Scientific Instruction. A sum of £20,000 has been already subscribed, and a further sum of £10,000 is required.

GEORGE BIRDWOOD, M.D. } Hon. Secy.
DYCE DUCKWORTH, M.D. }

11 Grafton Street, Piccadilly.

AGRICULTURAL PUPIL.—A GENTLEMAN residing in

a beautiful part of Hampshire, and having the management of landed Estates, has a VACANCY for a PUPIL. A knowledge of Agriculture in all its branches, and over a varied description of Soil, can be obtained, including the Breeding and Feeding of Stock and growth of Hops. This will be found an excellent opportunity for completing agricultural study. Terms which will include the use of a horse, and full particulars, can be obtained on application to FREDERICK GREEN, Esq., Barrister-at-Law, 7 New Square, Lincoln's Inn, London, W.C.

TO GRADUATES in HONOURS and CLERGYMEN.—

A CLERGYMAN desires on account of ill-health, to DISPOSE of the LEASE of a Seventeen-roomed HOUSE at Upper Norwood, the Furniture, and his Connection with a College, such Connection consisting of the privilege of Boarding the Resident Students.

The occasion presents a very favourable opening for a Private Tutor preparing Pupils for Cooper's Hill and the various Professional Examinations.

For particulars, address M. A. Messrs. Syme & Son, Solicitors, 7 Farnival's Inn, E.C.

CHISLEHURST COMMON, Kent.—To be SOLD or LET,

Rent £130, a newly-erected GUTHRIE VILLA, of handsome elevation, situated near Chislehurst Church and Camden Park. Seven Bedrooms, Bath-room, three Reception-rooms, Offices, and Gardens. Water and Gas laid on. The position of Chislehurst Common is well known, and is probably the most perfect round London, combining as it does splendid air, gravel soil, good surroundings, and close proximity to the Metropolis, being within half-an-hour by rail of Cannon Street or Charing Cross stations; it may fairly be said to include the advantages of both Town and Country.—Messrs. DUBREHAM, TEWSON, & FARMER, Auctioneers, 20 Cheapside, E.C.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill.

Physician—Dr. EDWARD LANE, M.A., M.D., Edin.
For Invalids and those requiring rest and change. Turkish Bath on the premises.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and

Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

ROBERT PARK, Manager.

AGREEABLE WINTER RESIDENCE.—ILFRACOMBE

HOTEL.—High and Equable Temperature. Moderate Charges "en Pension." Through Trains direct from Waterloo.

WINTER at the GRANVILLE.—Replete with Home comfort.

Hydrophatic, Turkish, Oregon, Saline, Plunge, and Medical Baths. Billiard and Concert Rooms. American Bowling Alley. Beautiful Views, Sea and Shipping. Table-d'hôte 6.30 P.M.—Address, THE MANAGER, St. Lawrence-on-Sea, Ramsgate.

COLLECTIONS of PHOTOGRAPHS. Completed, Collated,

carefully Re-mounted, Titled, and properly Bound, to open quite flat, and Interior-ed with Paper for Notes of Journey. Indexes made for reference.

PHOTOGRAPHS of the BIG TREES, &c., in the YO-SEMITTE VALLEY. Large size. Splendid Pictures for Framing.

MARION & CO., 23 and 25 Soho Square, London.

E. DENT & CO., 61 Strand, and 34 Royal Exchange, Manufac-

turers of CHRONOMETERS, WATCHES, ASTRONOMICAL and TURRET CLOCKS, to Her Majesty, H.R.H. the Prince of Wales, and H.M. the Emperor of Russia; makers of the Great Clock of the House of Parliament, and of the New Standard Clock of the Royal Observatory, Greenwich. Catalogues on application.

THE ASTRONOMER-ROYAL Reported to the Admiralty (August 13, 1870) on 40 Chronometers entered for annual competition, "M. F. DENT's is the best we have ever had on trial."—M. F. DENT & CO., Watch and Clock Makers to the Queen, 35 COCKSPUR STREET, CHANCERY LANE.

RUSSIA AND THE NEW CONFERENCE.

Obstinacy of the Russian Government in the pro-
position of the scheme which partially failed at
St. Petersburg, as more significant and more suspicious than the
objection of the project. When the Conference
proposed it seemed probable that the philanthropic
which were professedly contemplated by the Em-
PEROR ALEXANDER furnished the real, if not the exclusive,
motives of his diplomatic enterprise. It was not impos-
sible that the interest of great military Powers in discour-
aging resistance to the operations of regular armies might
have been but incidentally or unconsciously consulted. If
it is true that a second Conference on the same questions is
to be invited to meet at St. Petersburg, it can scarcely be
doubted that the three Imperial Courts have some definite
purpose in view. The invitation which has been issued to
the different Governments to send their remarks on the
Brussels resolutions to St. Petersburg is apparently super-
fluous. The English Government at least may reply that
it has nothing further to say on proposals to which it
has suspended its assent. It is already stated in semi-official
journals that the Governments of Russia, Austria, and
Germany are agreed on the amendments which are to be
introduced into international law, and that they are at the
same time waiting for an opportunity of proving that
their concert has not been disturbed by the refusal
of Russia to join in the recognition of the Spanish Gov-
ernment. There is a certain oddity in the announcement
that the South American Republics will probably be in-
vited to attend the Conference. A more doubtful hope is
expressed that the United States will concur in the pro-
posed legislation; but it is improbable that, even if the PRE-
SIDENT should be disposed to meddle with European negotia-
tions, the Senate will consent to deviate from the settled
policy of the Republic. The interest of the United States
in the laws of war is remote and uncertain, for they are secure
from invasion; and if it should be thought expedient to annex
Cuba or additional portions of Mexico, American commanders
will not desire to be hampered by fixed rules, nor will they
need the sanction of any Conference to enable them to deal
with any resistance which may be offered to their enter-
prise. The States of South America have much experi-
ence of civil war, and some of them perhaps may have
learned to regulate their periodical insurrections by a kind
of customary code. Their authority would have little
weight with any European Government which might de-
cline to be bound by the decisions of the Russian Confer-
ence. The Emperor of Russia will scarcely desire to
imitate the Pope, who controlled the Vatican Council by
the packed suffrages of a crowd of petty Italian prelates,
and bishops in *partibus infidelium*. If three or four great
military Powers agree among themselves on certain changes
in the laws of war, they can have no motive for calling at-
tention to the dissent and disapproval of their scheme by
other States.

The promoters of the Conference have received ample
notice that changes in the laws of war will not be unani-
mously accepted. The representatives of Italy supported
the proposals of Russia and Germany, but England, Bel-
gium, and Switzerland, though not dissenting, might have
been expected to withhold their assent. The Emperor of
Austria, the King of Prussia, and Lord Palmerston, and
his colleagues, have all been invited to the Conference.

national law. The English Government might with
perfect consistency refuse to take part in any further nego-
tiation. A new Conference can have no object except to
supply the shortcomings of Brussels, which were caused
by the objections raised by England and by the
minor Continental States. When Baron JOMINI at the
close of the Conference expressed a belief that the deli-
berations of the delegates might prove fruitful of good, he
was understood to admit in graceful and conventional lan-
guage that the hopes of his Government had been disap-
pointed. If the undertaking is resumed some attempt will
be made to repair the previous failure. It is even possible
that the three Northern Powers might undertake to deal
with the rules of maritime warfare, or that they might
agree to prohibit the traffic in munitions of war between
neutrals and belligerents; yet it would be but an idle en-
terprise to enact international laws without the consent of
England and France. It may be hoped that there is no
truth in a rumour that France is inclined to concur
in the projected changes. Any two or more States have a
perfect right to arrange between themselves the con-
ditions on which their troops and subjects may, in case of
quarrel, kill, burn, and destroy the persons and property of
one another. The traditional rules which are known as
laws of war can only be modified to the detriment of any
State by its own express consent. The United States still
retain the useless right of equipping privateers, which has
been surrendered by the European Powers in the event of
war between any of the parties to the Treaty of 1856.

The arguments of General VOIGTS RHEZT against ir-
regularities in the conduct of defensive warfare were
plausible in themselves, and they were probably urged
with a perfect conviction of their soundness. It may per-
haps be for the interest of the inhabitants of an invaded
country to abstain from proceedings which might provoke
formidable retaliation. It is agreed on all hands that
civilians who offer resistance to an invader must assume
the responsibility of combatants by submitting to some
kind of military organization. The Irish patriots who have
canonized the Manchester martyrs because they committed
a murder in time of peace forget that they are not
even caricaturing a practice that would be tolerated in
civilized warfare. A ploughman or a herdman who fires
at a passing soldier, and then ostensibly resumes his
peaceful occupation, is justly punished as an assassin.
A Fenian who murders a policeman at Manchester cannot
claim impunity on the ground that some non-existent Irish
Government may probably at a future time make war on
England. The Swiss and the Belgians objected, not to the
prohibition of isolated acts of violence, but to any pre-
liminary definition of the terms on which alone resistance
was to be recognized as lawful. It was impossible to foresee
the circumstances of future wars, and to know how far it
might be possible to satisfy specified conditions. Some-
times bands suddenly armed might have neither uniform
nor distinctive badges; and it might be impossible that
these chiefs should communicate with their own Govern-
ment or with the commanders of the regular army. Since
the termination of the Conference the German Government
has introduced into Parliament a measure which would
convert every able-bodied man in the Empire into a regular
soldier, and subject the branches of foreigners to certain the
same regulations of Germany, but they are particularly
interested in securing for themselves the alternative of
voluntary military service or of being obliged to enter the
army. The English Government of Russia, Italy,
and the other States, with the arguments of

Russian and German plenipotentiaries were received. It had been proposed that resistance of any kind to a force in military occupation of a district should be dealt with as a crime, and that an inhabitant furnishing information to his own Government should be punished as a spy or a traitor. It is true that in the performance of a patriotic duty of this description serious risk must be incurred; but the discretion of a general in command of an occupied district requires no aid from formal legislation. The Duke of WELLINGTON's statement that military law meant nothing but the will of the Commander-in-Chief was perfectly accurate.

Another and not unimportant class requires protection against the encroachments of diplomatists who regard war as the normal condition of mankind. Neutrals, though they have been the favourite objects of American and German invective, ought not to be treated as if they existed only on the sufferance of belligerents. An unoffending community cannot consent to forfeit all its rights because its neighbours engage in a quarrel with which it has no concern. If it continues its commercial intercourse with both parties, one belligerent will probably derive greater advantage from the trade than the other; but it by no means follows that the trade with both ought to be stopped. In the last war the French were more urgently in need of arms than the Germans, and, as they were stronger than their enemies at sea, they might perhaps have interfered with the export of contraband goods to Germany. Count BERNSTORFF was consequently instructed to protest against the supply of arms to the French; and in the first instance he was compelled to found his claim on the contradictory phrase of benevolent neutrality. The contraband trade afterwards became the subject of much angry declamation, and some paragraphs in the proposal of Russia to the Brussels Conference were probably intended indirectly to render the trade in arms between neutrals and belligerents illegal. Having adopted, in advance of all other nations, a systematic policy of peace, England is especially bound to watch and to resist all interference with the rights of neutrals. When the Foreign Enlistment Act was passed, more than fifty years ago, more than one member of Parliament expressed surprise that a Power which had taken part in every war of the last hundred years should take the interests of neutrals into consideration. As the Act was immediately intended for the protection of Spain in the contest with the revolted colonies, it was denounced by the Whig Opposition. The Liberal party of the present day sometimes inclines to the opposite error of exaggerating the obligations of neutrals and the rights of belligerents, but the painful experience acquired at Washington and Geneva has convinced prudent politicians of the risk of altering international law. Lord DERBY's caution in meeting the Russian proposals is at the same time judicious and bold, nor will an immediate repetition of the attempt tend to allay his distrust.

CURRENT POLITICS.

THE Parliamentary Recess fulfils the useful purpose of enabling the country to look on its representative body from a side other than that which is presented to it during the Session. When Parliament is sitting we have great measures to think of, party leaders to listen to, the careers of young officials to follow. The bulk of members fade out of notice. They may obtain a temporary notice by asking a question or airing a crotchet, but they cannot make known what manner of men they really are, what are their opinions, their habitual feelings, their standards of political purpose and duty. In the Recess they can reveal themselves; and as they are very generally men of eminence in their respective walks of life, or have attained some kind of consideration which gives them an exceptionally good local position, what they say deserves attention, particularly as we know that we shall not have too much of it, that Parliament will soon meet again, and then they will be once more eclipsed. One subject that has been handled by speakers of this class this week throws light on the practical difficulties which they have to encounter during the Session, and on the sort of rules which they lay down for their conduct. Mr. REED, in addressing his constituents at Tenby, endeavoured to make his hearers understand some of the reasons which a member has to weigh when he considers whether he shall vote

or not on a particular question. There was Mr. TREVELYAN's County Franchise Bill. Mr. REED thought Mr. TREVELYAN's proposal quite out of the first Session of a new and a Conservative Parliament. It was in favour of the extension of the franchise, as Mr. REED observed, is an element in politics that ought not to be disregarded, and Mr. TREVELYAN's proposal was as untimely as possible. As, however, approved of the proposal in itself, Mr. REED made up his mind to vote for it, in order to avoid all possible misconstruction as to his opinions on the main issue. In Session, however, if this untimely proposal is renewed, will think himself at liberty to abstain from voting, will then be more important to mark his sense of fully of stirring the question at present than to show what he thinks of an extension of the county franchise in the abstract. In the same way Mr. REED explained how it had happened that he voted for Sir WILFRID LAWSON's Permissive Bill. He did not in the least approve the Bill; but he has views of his own as to the authority which the ratepayers ought to exercise over the grant of licences. His opinions are not at all the same as those of Sir WILFRID LAWSON; but he voted for the Permissive Bill as a harmless, and, we may add, an extremely effectual, way of recording that he could frame a very different sort of Bill if he took the trouble. We do not wish to criticize the course Mr. REED took as to either the County Franchise Bill or the Permissive Bill. It is of much more difficult for an honest and conscientious man to choose the right course as to voting in Parliament than outsiders would believe. But eccentric utterances like those of Mr. REED show how very fallacious are the inferences drawn from the divisions in the House of Commons on subjects not seriously taken up by either of the great parties. If next Session a dozen members in the position of Mr. REED acted as he hints that he will act, and abstained from voting on the County Franchise Bill, whereas they voted for it last Session, it would be said that the measure was losing ground, that Liberals were changing their opinions, and that the defection of men like Mr. REED was indicative of the increasing Conservatism of the country. All the time the real truth would have been that Mr. REED and those agreeing with him had been precisely of the same mind on both occasions. Sir WILFRID LAWSON again has been cheering himself and his friends with the thought that he has lately gained in Parliamentary strength through an election which has cost his party so dearly. He had actually got a brace more members to vote for him in this Parliament than 'in the last. He now at least can estimate what style of bird is one of those whom he thus knocked over. Mr. REED was one of his new recruits, and Mr. REED takes the first opportunity to say that he thinks the Permissive Bill not at all the sort of measure he would like to see carried.

Mr. McLAREN has been for many years member for Edinburgh, and when he gets into the Music Hall of the Athenaeum of the North, and sees his constituents thronging to listen to him, he naturally feels like MCGREGOR on his proverbial heath. Mr. McLAREN seized on what was certainly a very fair and legitimate opportunity of stating what a very useful man he is as a member. An unkind report had been spread that he felt his years telling on him, and that he was going to resign. Nothing could be more untrue, and he would assure his friends that he had discharged his Parliamentary duties in a most noble and resolute way. He must draw the line somewhere, and he draws it at midnight. Then he goes to bed like a sensible man, but up to twelve he is always in the House. The consequence of this persistent conduct is that he has been able to take part in an extraordinary number of divisions. He was actually present on no less than seventy-nine occasions last Session when a division was taken, whereas there were five Scotch members who were so careless of their Parliamentary duties as to have only voted eighteen times during the whole Session. Mr. McLAREN seems a little to mistake the character of his undoubted usefulness. He does a particular thing, and he does it well. He contributes to the management of public affairs the certainty of his presence up to twelve o'clock. This is very right in itself. There ought to be a few dogged men who sit on and on, who want no relaxation and no amusement, and who are always at hand to check the Government for the time being. But a few of these watchdogs suffice. It

was Mr. McLAREN who spared those idle five Scotch members from the fatigue of voting more than eighteen times. He was sure to be there watching what was done, ready to bark, if necessary, and very proud of what he was doing. One policeman stands outside Messrs. COURT'S bank, and his presence is comforting and imposing to the customers of the establishment; but one policeman answers the purpose as well as thirty would answer it. Mr. McLAREN is the one Parliamentary Scotch policeman who is wanted, and it is a post which he fills admirably, and to which he is perfectly well suited; but he need not complain that twenty-nine others do not come to join him. He may be satisfied with being alone in his glory. Nor is it any discredit to him that he is a little vain of his work. People of all sorts are wanted in a great national body like the House of Commons, and an elderly man who can sit from four to twelve four nights a week for six months, and listen to all the dreary talk that goes on, and yet can come up to take what other people would consider his punishment, always smiling and serene, is a man with extraordinary gifts of some sort, and the public may be thankful to have him, and Edinburgh may be proud of returning him. But men with extraordinary gifts are always inclined to think themselves entitled to set the standard of humanity. Mr. McLAREN is like a man with a biceps who is always baring his arm and insisting that the part of the body between the shoulder and the elbow is the only thing worth noticing in man; or like a bicycle amateur who cannot understand how people can be so idle and unmanly as to go by train. We trust that during many more Sessions Mr. McLAREN may be spared to sit up in the House of Commons till the clock strikes twelve; but so powerful a person ought to be satisfied with a good-natured and secret contempt for persons who keep their coatsleeves down, or who think that to take a seat in an express train is at once the most comfortable and the quickest way of getting to Brighton.

There are two things on which all, or almost all, the Liberal members who are now addressing their constituents are agreed. One is that they can do nothing without Mr. GLADSTONE; and the other is that they like the Conservatives being in office. As Mr. McLAREN well puts it, Mr. GLADSTONE is a head and shoulders taller than any other Liberal leader; and Mr. REED observes with delight that this modern SAUL is, so to speak, leaving his father's asses, and has pleased all honest Protestants by his late denunciations of the Vatican. It is true that Mr. GLADSTONE is not quite so "quick to discern the signs of the times" as Mr. DISRAELI, and has allowed his rival to get a little ahead of him in the race for Protestant support. But he has done, on the whole, better in this respect than could have been expected, and he may pull up yet if he sets himself earnestly to the task. As to the Conservatives, not only do these Liberal speakers confess that the country wishes the present Ministers to be in office, and to give them a fair trial, but they own that they find much private satisfaction in the change of Ministry. It is personally so much pleasanter to have to do with Conservative officials, who are always courteous and conciliatory, and will listen to reason, than to be snubbed by Liberal officials and treated like dirt by the very men whom Liberal members are helping to keep in office. It is really strange how Mr. GLADSTONE could have collected together so many persons who, as officials, managed to give the deepest offence by simple want of decent manners. The GLADSTONE Ministry, or at least some prominent persons in it, treated the humbler members of the party, not as human beings, with feelings, and aims, and vanities of their own, but as machines wound up to vote in the right way on a series of big questions. The day of the big questions is over, and now these despised machines are candidly explaining that they are men. No set of members supported Mr. GLADSTONE through thick and thin with such pertinacity and fidelity as the Scotch, and no set of members were treated so contemptuously, and could get so little attention paid them. It was in vain that Mr. McLAREN set up till twelve o'clock and voted with his party whenever he saw a chance of stretching his legs a little by walking into a lobby. He was made to feel that he would ask in vain for little things which would be accorded in a moment to an English or Irish member. It is to be hoped that Mr. GLADSTONE will ponder over such speeches as that of Mr. McLAREN before he again takes office. For in the field of Parliamentary management, no less than in that of the championship of Protestantism, he must feel that he has not been quite so quick in discerning the signs of the times as Mr. DISRAELI, and that he has a good deal of lost ground to make up before he can again take office to the full satisfaction of Mr. McLAREN and others of whom Mr. McLAREN is a fair type.

antism, he must feel that he has not been quite so quick in discerning the signs of the times as Mr. DISRAELI, and that he has a good deal of lost ground to make up before he can again take office to the full satisfaction of Mr. McLAREN and others of whom Mr. McLAREN is a fair type.

MARSHAL MACMAHON'S MESSAGE.

AFTER yielding matter for innumerable speculations of the most various and contradictory kinds, Marshal MACMAHON'S Message has at last been read to the Assembly. It has evidently undergone an immense amount of revision. All the Ministers have had their say on it, and the MARSHAL, or some one acting on his behalf, has apparently tried to express beforehand what those who may soon be Ministers would like to have said on it. The first four of the five paragraphs seem to speak with more authority than the MARSHAL has yet assumed. This may be due to the fact that General DE CISEY always speaks like a soldier, or it may mean that the MARSHAL really feels himself a greater man since his Cabinet has ceased to be composed of politicians. It is satisfactory, after so many rumours of differences with Spain and Germany, to hear that the relations of the Government with foreign Powers have been constantly and increasingly friendly. An exceptional harvest and increased exports always seem to give stability to the administration which is able to announce them, and in France, even more than in other countries, accidental prosperity is commonly placed to the credit of the institutions under which it is attained. During the winter and spring corn-growers and vine-growers will be tempted to ask themselves whether NAPOLEON III. himself ever did more for the agriculturist than Marshal MACMAHON has done during the last autumn. Hopes are even held out that, under these favourable conditions, the equilibrium of expenditure and income may be attained without the imposition of any new taxes. The industrial and commercial prosperity of the country will increase the returns of the existing taxes; and the MARSHAL hints that the Government has found means of bringing these returns nearer to the point which they ought to reach if every one bore his fair share of the national burdens. Of course it is not pleasant to the taxpayer to learn that any exemptions he may hitherto have enjoyed are likely to be reviewed in a prying and critical spirit. But to be made to pay taxes already imposed is less grievous than to have new taxes created. There is nothing, therefore, in the financial part of the Message which is not calculated to soothe rather than alarm.

The MARSHAL bases his desire that the Assembly should arm him with additional powers on observations made during his recent tour. Everywhere, he says, he found the desire that organization of some kind should give to the power created by the law of the 20th of November the strength it requires to fulfil its mission. The country asks the Assembly to guarantee the regular working of the public power during that period of stability which it has promised to France. The MARSHAL hopes that the Assembly will do what is expected of it. He will not decline his share of the work, and the intervention of his Government—in the shape, it may be presumed, of frequent Messages to be read by General DE CISEY—shall not be wanting. He himself is in office "only as a means of social defence and national recovery." In this task he hopes to have the assistance of all men of goodwill, of all who "subordinate their personal preferences to the necessity of the present time and the sacred cause of the country." But whether he obtains this assistance or not the MARSHAL means to go on with his work. He has been entrusted with the Executive power for seven years in the interest of peace, order, and public security, and the same interest makes it his duty not to desert his post, but to "occupy it till the last day with immutable firmness and scrupulous respect for the law." The moment that the Message had been delivered all parties in the Assembly seem to have set to work to explain it away. "In spite," says the *Times* Correspondent, "of the MARSHAL'S reiterated declaration as to holding office up to the last moment, Royalists, Bonapartists, and Republicans are convinced that he would retire before the vote of 'the majority of the Assembly.'" The Marshalate, they think, will end whenever the reason for which it was created ceases to operate. In support of this, they quote the

expression that the "same interest"—the interest, that is, of peace, order, and public security—makes it the MARSHAL'S duty not to lay down his authority. Supposing, therefore, that this interest were otherwise provided for, that under HENRY V. or NAPOLEON IV. or President THIERS, France could enjoy the very blessings which she enjoys under Marshal MACMAHON, what is to prevent him from resigning? Social defence and national recovery being otherwise provided for, the only motive which has determined the MARSHAL to accept power will no longer influence him.

Unfortunately for France, the accuracy of this interpretation of the Message is not likely to be put to the test. Whether peace, order, and public security are well or ill provided for under the MARSHAL'S rule, it seems to be the only rule under which they can at present be provided for at all. Notwithstanding the injunction laid upon his friends by the Count of CHAMBORD not to vote anything which can prevent or delay the restoration of the Legitimate Monarchy, there cannot be many members, even of the Extreme Right, who have the slightest faith in their ability to do anything which can affect for good or evil the prospects of HENRY V. All that can be done to make his restoration impossible has been done by his own pen. After every allowance has been made for the strength of the Imperialist reaction, it is still the more probable supposition that the Bonapartists will see the Septennate out before making any overt effort in favour of NAPOLEON IV. As regards the Republic, its prospects are certainly less bright than they were at the beginning of the recess. It then seemed probable that the impossibility of organizing the personal Septennate, together with the increasing dangers of an ultimate restoration of the Empire, supposing nothing to be organized, would influence a sufficient number of wavering deputies to ensure the adoption of M. CASIMIR PERIER'S Bill and the definitive proclamation of the Republic. The dissensions which have lately shown themselves in the Republican party are exceedingly injurious to the realization of any such hope. The successes of the Republicans in the country have been mainly due to the growing conviction among the rural constituencies that the secret of vesting the control of Republican policy in the moderate wing of the party had somehow been discovered. Opinions might differ as to the means by which this happy result had been attained, whether by the increasing resolution of the Moderates or by the increasing wisdom of the Radicals; but, with the single exception of M. BARODER'S election, all the political symptoms seemed to indicate that it had been attained somehow. The municipal elections, first in the provinces and then in Paris, have greatly shaken this belief. There is something unpleasantly significant in the line which M. GAMBETTA'S special organ has taken in the Paris elections. No one knows better than M. GAMBETTA that a victory of the moderate Republicans in Paris would have done more than anything in the world to consolidate the Republican party, and no one has more reason than he to wish to see this consolidation effected. Yet he has not only been powerless to bring about the result which he no doubt desired, but he has even felt himself obliged to feign the warmest sympathy for the Radical candidates and the most rapturous joy at the Radical victory. Paris, the *République Française* declares, has covered herself with glory by filling her Municipal Council with Radicals of the most violent type. This seems to show that M. GAMBETTA feels that his power over the Extreme Left has been greatly weakened by the non-fulfilment of the hopes which he no doubt held out to them as the consideration for consistently keeping themselves out of sight. They abandoned the control of Republican policy to men who have only become Republicans at the eleventh hour, because they were assured that the result of so doing would be to establish a genuinely Republican Government in France. If that contingency had come to pass, they might have remained contented with their bargain. As it is, they probably feel that they have sacrificed themselves to no purpose. The Republican cause has been given over into the hands of men who only advocate it because they cannot help themselves, and, after all, it is no nearer victory than if it had remained in the keeping of its true friends. It is doubtful whether the alliance between the moderate and the extreme section of the Republican party will long survive the reassertion of Radical policy in the municipal elections. If it is broken up, the last chance of Marshal MACMAHON ceasing to think himself indispensable to the maintenance of peace, order, and security will disappear with it.

MR. RATHBONE ON LOCAL GOVERNMENT.

MR. RATHBONE lately published in the *Times*, in continuation of a former letter, an instructive essay on one of the most important conditions of good local government. He had previously complained of the great increase in local rates, and in the municipal debts of some of the largest towns. A change in the machinery of local taxation would perhaps scarcely diminish local expenditure, but much of the efficiency of local, and especially of rural, administration depends on the convenience of the area within which it is to be exercised. In former times the division into counties and parishes was sufficient for practical purposes. The justices managed the highways and the prisons, and dispensed criminal justice at Quarter Sessions and Petty Sessions. Their more important functions are still preserved, though Highway Boards include elected members; but the transfer of their financial duties to representative bodies will probably not be long delayed. Both officially and in their private capacity the same country gentlemen had much influence in the administration of the Poor-law, which was the most important of parochial functions. Since parishes have been consolidated into Poor-law Unions the justice may, if they think fit, act as *ex officio* members of the governing body. The remainder of the Guardians are chosen by a suffrage which gives additional power to the larger ratepayers. In boroughs and places governed by Local Boards all but the judicial power is vested in Councils elected by equal household suffrage. The County Court Judges, who are independent of local patronage, administer civil justice in areas which are from time to time defined or altered at the discretion of the Government. Mr. RATHBONE holds that unnecessary expense and complication are caused by the multiplicity of administrative areas which cross and overlap each other apparently in the most arbitrary manner. He mentions the case of a Parliamentary borough with 30,000 houses and 160,000 inhabitants, which is divided into three parishes and two Unions, into three municipal boroughs and six Local Board districts, and into nine urban and two rural sanitary districts. It would certainly seem that in this instance there must be an unnecessary number both of elected representatives and of paid officers; but it may be observed that nearly all the divisions are modern, and even recent, and that the areas have been defined by the proper authorities in each particular case with regard to their own special objects. It is not stated whether either or both of the boroughs have been incorporated under the powers given to the Crown by the Municipal Act. The six Local Boards must necessarily be of later date than the first Public Health Act, and the sanitary districts have probably been set out within the last two or three years. In all these cases the Commissioners or other authorities might, if they had thought fit, have made the Unions and sanitary districts coterminous with the Parliamentary borough. The Local Boards could only represent the parts of the district which lay outside the municipal boroughs, but it was by the desire of the inhabitants that they were six in number instead of one. It is of course possible that other motives may have operated as well as regard for the public good; but local opinion deserves to be taken into consideration in all arrangements of the kind.

It is perhaps a minor objection to the independent organization of districts for different purposes that it produces confusion in simple minds. A puzzle-headed layman who as a juror, or in some similar capacity, lately listened to an argument on the meaning of the word "district" in an Act of Parliament, could not be induced to understand how a highway district, or a district supplied by a certain Gas or Water Company, could fail to be regarded as a district for all imaginable purposes. Mr. RATHBONE, who is in no degree puzzle-headed, perhaps carries his doctrine to excess when he suggests that the County Court district and the Police district should coincide with the area of local administration. The County Court district includes as many towns as can be attended in their order by a single judge at intervals short enough to secure the prompt and regular administration of justice. There is no reason to assume that an area determined by the distribution of the population, by railway facilities, and by other considerations of the same kind, would be the most convenient for sanitary or Poor Law administration. The ancient divisions of counties are necessarily disregarded in the formation of Unions and of County Court districts. When it happens that the boundary between counties

is a river valley traversed probably by a single road and a single railway, it is a waste of labour to employ two sets of officers to travel side by side. Although it might be injudicious to prescribe coincidence of local areas by an inflexible rule, there is much force in Mr. RATHBONE's contention that the object is in itself desirable, and that in the majority of cases it would involve no practical difficulty, except in its original establishment. It has often been remarked that the choice of capable and trustworthy representatives is sometimes facilitated by adding importance to their duties. If the business of the House of Commons were distributed among a dozen little Parliaments, the position of a member would no longer be an object of ambition to the higher classes or to the ablest men. A Town Councillor who is also by virtue of his election a member of the School Board, and of the Sanitary Board, may be supposed to feel a responsibility which may possibly sometimes reflect itself by anticipation on his constituents. It cannot be said that popular suffrage always prefers ability, or even honesty, but corrupt motives or carelessness are probably most powerful in elections to places where it is supposed that a worthless nominee will do comparatively little harm. There is much good sense in Mr. RATHBONE's suggestion that a local assembly or Board dividing itself into Committees would secure greater fitness in the members delegated for special duties than a number of separate elections. Almost any body of limited numbers, appointed by election or otherwise, is less impenetrable to a sense of duty than a large constituency.

The greatest of impediments to sound organic legislation is the real or supposed necessity of deriving all power from the votes of a numerical majority of ratepayers. The least enlightened portion of the community has for many purposes unlimited opportunities of overruling sounder and more qualified judgments. Even the hasty writers who thoughtlessly approved, on its first production, of Mr. BEAL's scheme of a metropolitan Republic, have since been startled at the prospect of being governed by a million of irresponsible votes. Mr. RATHBONE, whose object is good local government, and not the preponderance of a single class, recommends a more complicated mode of selection for local governing bodies. He proposes that the justices should appoint a portion of their own number to form one-fifth of the local assembly, that two-fifths should be elected by the plural vote now used in the election of Guardians, and that two-fifths should be chosen by the whole body of ratepayers. The details of the scheme would of course admit of modification, but the principle seems to be sound. The magistrates have administered county finances with praiseworthy economy and efficiency, and among those of them who have thought fit to act as *ex officio* Guardians of the Poor many have exercised a valuable and merited influence. Probably Mr. RATHBONE may be right in his assumption that a Committee delegated for the special purpose would attend the Union Boards more regularly than a detachment of volunteers. The Visiting Justices who superintend prisons and asylums discharge their duty with habitual punctuality. It unfortunately happens that the numbers of the resident gentry are declining, sometimes through changes of social habits, and in part through the accumulation of great estates. Modern prejudice, seconding sometimes professional instincts, has in many counties discountenanced the appointment of clergymen as magistrates, to the great detriment of both orders. It is desirable to make the most of many careful and patriotic country gentlemen who are still willing to discharge unpaid duties. The local government of which Englishmen have for centuries boasted has always, except in the towns, been almost exclusively aristocratic, though the higher nobility have been occupied with more exciting objects. The Poor Law franchise has created in the Boards of Guardians creditable representatives of the middle class. Farmers have too much regard for their own pockets to entrust the expenditure of the rates to demagogues or declaimers, though they sometimes prefer Guardians who have acquired a reputation for indiscriminate parsimony. There are still districts in which the farmers have for forty years refused to build workhouses, and where the Poor-law has consequently never been brought into practical operation. Finally, it is reasonable that the numerical majority should have a voice in the administration of affairs which concern themselves as nearly as their neighbours. Mr. RATHBONE's three Estates would correspond with sufficient

accuracy to as many divisions of society and separate interests. Before his plan is adopted careful inquiry should be made into the reasons which have determined the definition of existing districts for various purposes.

ALSACE-LORRAINE.

IT is naturally somewhat difficult to get any accurate information as to the present position of the inhabitants of the provinces annexed to Germany. The French press is not allowed to touch on a subject which might easily provoke German interference, and the German press is far too much at the mercy of the authorities to venture on any subject which might be likely to give offence. That the first hopes of the conquerors have been disappointed is notorious. They fully believed that historical recollections of a somewhat remote date, and a partial community of race, would make the population of Alsace, and perhaps of Lorraine, exceedingly pleased with the prospect of being once more German. Experience has shown that this anticipation was founded on a mistake. The chief reason why the event should have thus belied the expectations of the Germans is one which is very natural that Germans should not be able to realize, but which Englishmen can easily understand. It is so very much pleasanter to be in France than in Germany. Life is so much brighter and happier; there is so much more civility and kindness, so much more fun, so much less domineering and hectoring in France. Germany is a great country, and the Germans are a great people; but to get away from Germany into France is like getting from school-time into the holidays. There is nothing uncomplimentary to the Germans in saying this. They are proud of living a life in which lessons of some sort are always going on, and of having formed a society in which every one either is, or hopes to be, an usher. Such a life may be full of great purposes, and such a society may be full of power and energy. But to the human mind holidays and the ways of holiday life are sweet, and to the inhabitants of Alsace and Lorraine annexation was the end of holiday life. The days when the provinces really belonged to Germany were also very far away, and to have belonged to Germany in those days was not so very obvious a gain and privilege after all. The most recent recollections of a share in national glory were those which associated Alsace with the wars of the Republic and NAPOLEON. The course of business, too, had long drawn Alsace towards France, and new relations in business are not formed in a moment; and although there are many Protestants in Alsace, yet the population is sufficiently Catholic to make the ceded districts a very promising field for the struggles of Ultramontanism against Germany. So far as is known, the richer and the professional classes are still so hostile to Germany that to be suspected of not being violently French in feeling amounts to exclusion from many circles. The representatives sent from Alsace and Lorraine to the German Parliament are violently hostile to Prince BISMARCK, and violently devoted to his ecclesiastical enemies. And the German officials do not spare the provincials over whom they are set. They are always ordering something, finding out something, forbidding something; and this is vexatious in daily life. It is not a great matter, but it is a nuisance to have to shape the signboard of a shop and to choose the name of a baby so as to please a tiny German official. Still the lower and humbler classes are probably reconciling themselves to the change. They bow to fate, and it must be owned that a long experience of administration on the French system was a tolerably good preparation for submission to any authorities that happen to be established. The French part of the population loses by the official language now being German, but the German part of the population gains by it. A very considerable sum has been devoted out of the indemnity to be expended on the annexed districts, and money is money, although it may be German money. The general result may therefore perhaps be safely stated by saying that, though the sentimental grievance of having been made Germans against their will still remains in almost its full force, yet things have settled down in some measure, and there is, if not more content, still more acquiescence, in the change of nationality than there was a year or two ago.

The sum which the German Government thinks it advisable to order to be spent in Alsace and Lorraine on

University and school education is so large that an Alsatian deputy ventured to complain that it was quite out of all proportion to the needs of those whom it is intended to benefit. This complaint afforded Prince BISMARCK an opportunity of making a general statement as to the policy of Germany with regard to the annexed provinces, and he shaped his statement in that style of extraordinarily plain speaking of which he is so consummate a master. He begged the deputies from Alsace and German Lorraine to understand that Germany did not fight and conquer, and annex a couple of provinces, merely to please the people who happened to live there; Germany wanted a good military position and took it. Whether the inhabitants of Alsace and Lorraine like their country being used as a bulwark of Germany is not very material to Germany. They may like it or not like it, but the result will be just the same. They have got to see their territory turned to the purposes for which Germany seized it. It is true that, as the annexed provinces have been made a part of the German Empire, they are allowed to send representatives to the national Parliament; but these representatives need not be under the delusion that they are at all welcome when they get to Berlin. They are indeed of some use, for they show Germans what nonsense can be talked by the friends of the Ultramontanes, and they impress on their hearers how intimate is the connexion between Ultramontanism and hostility to Germany. This is all the good they are. They are foolometers, representing a territory which is used as a bulwark. There is no mistaking language like this, and it is very much, we imagine, the kind of language which deputies from Gibraltar and Malta would hear if our system unfortunately admitted of the presence of such persons at Westminster. If a nation finds it necessary or convenient to seize on bits of strange territory and use them as bulwarks, the kindest and best course is to be as plain and firm as possible with those who object to be made the victims of the process. It is to the real advantage of the inhabitants of Alsace and Lorraine that they should know that grumbling and disaffection will not help them in the very least. The only way of making them submissive to their lot is to inspire the belief that it is inevitable; just as nothing can be more cruel kindness to the Irish than to treat Home Rule as an open question, and to pretend to listen to those who press for the dismemberment of the Empire, when we know all the time that we mean to do our utmost to prevent anything of the sort. The general tenor of Prince BISMARCK'S remarks is accordingly free from objection: but he certainly seems unnecessarily defensive now and then in the way in which it pleases him to put what he has to say. He stated, for example, in his speech on Alsace Lorraine, that France is planning a new war against Germany. This is a guess or a suspicion, and to state it as a fact is very insulting to France. Supposing a French journal stated the same thing as a fact, Prince BISMARCK would instantly ask for the suppression of the journal, which he would say was exciting hostility between the two nations. What can be a greater inducement to hostility than that he should take upon himself to say what he would allow no Frenchman to say, and that he should thus bring home to Frenchmen how painful is the degree of discretion exacted from the French Foreign Office?

But, although the primary basis on which Prince BISMARCK necessarily relies in governing the annexed provinces is that of force, he has agencies in view which will, he thinks, in time do much to create a real German feeling in these districts. On the tendency of service in the German army to make all serving in it accustomed to the thought that they are subjects of the same sovereign, he has often dwelt. On this occasion he referred more particularly to the other great instrument of which he is prepared to make the utmost use—that of education. A great amount of money is to be spent in education in Alsace and Lorraine, because it is precisely education of the German pattern that those who live there most need. The University of Strasburg is to be made one of the first in Germany, that thus the highest and best German thought may find a home in the annexed provinces, that the solidity and thoroughness of German learning may be appreciated there, and that the standard of professional and official competence may be raised until those anxious for advancement see that they must work in the German way and think after the German fashion if they are to get on. As for the lower schools, Prince BISMARCK openly declares that

it is by getting hold of the direction of popular education that he thinks the State will best cope with the party who, as he says, do not like the poor to know too much. The Alsations shall be made to feel that it is the priests who wish them to remain ignorant, and German statesmen who wish them to be well taught. All these sentiments of the PRINCE were received with the heartiest approval by the majority of his hearers, and nothing would come more home to the hearts of a German audience than this challenge to the enemies of Germany on the ground of education. The movement against Ultramontanism in Germany is partly a political movement, a movement of those who wish Germany to be united and the State supreme; but it is also a movement of education against ignorance. Prince BISMARCK has directed and intensified the current of opinion on this head in the German middle class; but he certainly did not create it. The Germans, by whom education is so cherished, and to whom education means so much, have a feeling of political antipathy to the pretensions of Rome as great perhaps as that entertained in England; but they have also an abhorrence of foolish teaching, merely as such, which is peculiarly their own. They feel a pang of sincere regret when they think of the waste of human power which is involved in the children of the poor being handed over to be taught only just as much as seems safe to a very ignorant priest: and nothing probably would be more delightful to the majority of the German Parliament than the thought that it could sanction the expenditure of a much larger amount of money on education in their new territory than the poor blind priest-led people of this territory considered at all necessary.

NATIONAL DEFENCE.

IF it were possible to bring home to our minds the suddenness and swiftness with which war will come, if it does come, there would be no difficulty in adopting adequate measures of national defence. But unfortunately we cannot realize the peril in which we stand, and we are content to rely on the spirit of the nation, forgetting that that spirit requires time to exert itself effectively, and that, when we are attacked, it will be too late to organize resistance. The history of the war with France which began in 1803 may be safely quoted as an example of what our next serious war will not be. The genius and energy of NAPOLEON were devoted during two years to preparing an army and transports for invading England, but as he worked we counter-worked, and, although we are slow beginners, we can go fast when fully roused. But if there were now an enemy of equal capacity wielding the resources of a great nation, he would be upon us in a few weeks, and at best we could only escape dishonour by enormous sacrifices. At the beginning of 1804, after war had been six months declared, the spirit of the nation was fully roused to defend the country, and volunteers, militia, and yeomanry swelled the numerical strength of the army within the British Isles to 650,000 men. A number of small vessels, each armed with one or two heavy guns, were stationed at the Nore, as well as large ships heavily armed, which, although unfit for sea, would be formidable as floating batteries. The Martello towers which still remain were erected along the coast. In mud-Channel a powerful fleet kept watch vigilantly, ready to open fire upon the invading flotilla as soon as it showed itself outside the French ports. These preparations were tolerably complete within a year after war broke out, and although NAPOLEON came twice to the coast in 1804, he did not venture to test their sufficiency by quitting harbour. He appears indeed to have satisfied himself that he could not succeed in an invasion unless he could establish at least a temporary superiority of naval force in the Channel. The combinations by which he hoped to attain this result were frustrated by the battle of Trafalgar; but during the year 1805 the public mind of England was deeply impressed with the conviction that its fleet alone was an inadequate protection. It is scarcely necessary to remark that no fleet we have, or can have, will ever again give to this country the naval superiority which it possessed in 1805; and yet it did not trust for its defence to that fleet alone, but organized a military force amounting, in troops of all descriptions at home and abroad, to nearly three-fourths of a million of men. This the country did when it was comparatively poor and sparsely peopled, because it felt its danger. The precautions then

taken have never been alleged to have been too great, and it seems to follow that those which we are now taking are too small. There is always a chance that a resolute enemy willing to incur great losses for an adequate object might succeed in forcing troops across the sea in some one of several attempts; and if we had to fight on our own soil, the sacrifice of property, even if we saved our national life, would be enormous. As a mere matter of business-like precaution, we ought to ensure ourselves fully against such a tremendous risk.

The spirit in which such an attempt would be made, if made at all, was that displayed by the Germans in the battles around Metz. They suffered severe losses, but they employed forces so large that those losses bore only an inconsiderable proportion to the whole. There is almost no limit to the number of French or German troops that might be collected on the coasts opposite to our own. But it would be a much more difficult matter to provide those troops with transport. NAPOLEON had about one hundred and twenty thousand soldiers in and around Boulogne, and they could be embarked, with all their stores and supplies, ready for action, in an hour. The vessels in which they embarked had, however, been built for that special purpose, and this was an affair of months. It is no easy matter to provide transport even for 25,000 men, as we know from our experience in the Crimea. But our neighbours are better organizers than we are, and besides they would dispose absolutely of the entire naval resources of the coast from which the attempt was made. The required transports would now need, not to be built, but only to be collected, and a few weeks would suffice for that. One of the events which most disturbed the public mind of England in 1805 was the passage along the coast from Dunkirk to Ambleteuse of part of the flotilla of invasion. This passage was effected in spite of vigorous opposition by our light cruisers. "Although difficult," says JOMINT, "the invasion of England has always been regarded as possible." The descent once made, he thinks the capture of London almost certain. "Perhaps," he makes NAPOLEON say, "we should have encountered some dangers." The creation of a flotilla, and combinations to ensure the presence of a fleet, were indispensable preliminaries; but these having been secured, "ten hours only would be required for landing 150,000 disciplined and victorious soldiers upon a coast destitute of fortifications, and undefended by a regular army." This was the view under which NAPOLEON began to form camps about Boulogne in 1803; "at all events the menace would cost nothing," and it would compel England to make defensive preparations at ruinous expense. This remark deserves attention. Such a menace is easily made by a great military Power, and could not be disregarded. It would compel us to do that hurriedly and at enormous expense which we might have done deliberately and economically. "These preparations," says NAPOLEON, "cost England dear, but they revived the military spirit of the inhabitants." If timely measures of precaution, which need not be costly, could be now taken, the military spirit of the country would never need revival, because it would be steadily maintained.

It was the declared opinion of Mr. PITT in 1803 that to a regular army, however excellent, even aided by the militia, the country ought not solely to trust, but that in a crisis so full of danger it ought to superadd "some permanent system of national defence," either to a certain degree compulsory or formed upon voluntary zeal and patriotism. "This," said Mr. PITT, "ought to be resorted to as the grand source of domestic security." The army must be the rallying point, must furnish example and instruction, and must give the principles on which a national system of defence must be formed. This language seems applicable to the present time, when Europe is in perpetual crisis, if we may so say, and all nations except England are ready for a campaign to-morrow. But, although the army ought still to be the rallying point of national defence, there is a widely expressed feeling that the army is less capable than it was of furnishing example and instruction to volunteer forces. There is, or will soon be, a large proportion of raw lads in the ranks, and, even assuming that in health and character they are unobjectionable as recruits, they cannot supply the place of veterans. An army fit to form the basis of a system of national defence must consist of men, not boys, and men can only be had by paying for them.

It might be possible to offer some indirect advantages which would be equal to higher pay, and in particular the soldier might be allowed to earn something for himself by labour during the long hours which he now spends in idleness, and often in drink. At a time when the Guards, besides their proper military duty, did the duty of police in London, and did it well, they habitually worked in the coal trade; and the labour thus undergone made them, when sent to Flanders, the best men at trenchwork in the whole army. Of late years any proposal to employ soldiers at harvest or other work has been objected to by those with whom they would compete in the labour-market; but now that labour is so scarce and dear, it begins to appear irrational to condemn many thousands of able-bodied men to irksome and pernicious idleness. Officers may perhaps fancy that soldiers who should be also labourers might be deficient in smartness, but the "coalheavers," as the Guards were called, furnished an example to the contrary; and besides, it behoves the country to secure efficiency, even, if need be, by some sacrifice of appearance. The localization of regiments introduced by Lord CARDWELL will no doubt help to attract a better class of recruits. There is, however, danger in supposing that this plan or any such plan can meet the necessity of the case. That can only be done by applying the principle of the Defence Acts of 1803, and thus "enabling HER MAJESTY more effectually and speedily to exercise her ancient and undoubted prerogative in requiring military service of her liege subjects in case of invasion of the realm." To avoid liability to service with the Militia or Regular Army under these Acts, or from other motives growing out of the national peril, 380,000 volunteers had enrolled themselves by the end of 1803, and a force of about that number was maintained during the next two years, at an expense to the country of rather more than 1,000,000*l.* a year. It is easy to understand why so many volunteers offered. The desire was general in the middle classes to avoid being placed in ranks liable to be filled from gaol and workhouse. The difficulties of recruiting in those days were enormous. The Regular Army and the Militia competed against each other, and both took what they could get. Where physical strength appeared they asked no question as to character. High bounties tempted desertion, which even severe punishment could not prevent. The parallel between that time and the present is completed by the statement that there are now 900 military prisoners at Millbank. The evil being the same, let the same spirit arise to meet it. Opinions differed as to whether this volunteer organization of 1803 was the best possible disposition of men and money; and we do not insist upon this particular application of the principle of general military service, but on the principle itself. A statesman of that age wished to see "the great mass of the population of the country" so far trained as to be able to recruit immediately, whatever losses the regular army might receive in action, and then "he should consider the country invincible." Such training would revive or maintain military spirit; it would promote health, order, and sobriety; it would cost little; and the worst that can be said against it is that such precaution is perhaps excessive. If it be true that NAPOLEON allowed that the chances were ninety-nine to one against the success of an invasion of England, it would still be the part of a wise people to provide against the hundredth chance.

THE CANADIAN RECIPROCITY TREATY.

THE members of the Deputation which lately addressed Lord DERBY and Lord CARNARVON on the Reciprocity Treaty between Canada and the United States may perhaps find that the official answers which gave them natural satisfaction will not necessarily tend to promote their objects. Nothing can apparently be more reasonable than the demand that the Canadians shall not be allowed to covenant for the admission of foreign merchandise at lower rates of duty than those which are charged on English produce. Both the Ministers expressed their cordial concurrence with the opinions of the Deputation, and promised that no differential tariff should receive the sanction of the Government. Neither the FOREIGN SECRETARY nor his Colonial colleague can be suspected of thoughtless precipitancy, and their language furnished a proof, which was scarcely required, that they both hold sound economical principles; yet it is difficult to under-

stand how they will, in certain contingencies, be able to fulfil the engagements into which they have voluntarily entered. There is some reason to believe that the fulfilment of their promise would prevent the conclusion of any Treaty of Reciprocity, although such an arrangement is desired by the representatives of important Canadian interests, and although the adoption of the Treaty has been urged on the American Government by the English Minister at Washington. It is to be regretted that Sir EDWARD THORNTON, having spent his life abroad in diplomatic employment, should not have found opportunities of mastering the simplest principles of political economy. The paper which, in concert with a Canadian colleague, he presented to Mr. HAMILTON FISH is founded on the preposterous assumption that, of two persons or two communities who make the simplest bargain, one must necessarily be a loser. The American Protectionists, like Sir EDWARD THORNTON, believe in the obsolete doctrine of a balance of trade, and hold that it is essentially profitable to sell, and that buyers lose by every purchase. That gold or money constitutes the only true form of wealth is another proposition which Sir EDWARD THORNTON has derived from utterly discredited authorities. It is possible that the American managers of the negotiation may be influenced by arguments and assumptions which reflect their own prejudices; but when Sir EDWARD THORNTON undertakes to show that under the existing system the balance of trade is against the United States, Mr. FISH may reasonably ask why the Canadians should seek to disturb a relation which is favourable to their own interests.

It is asserted on good authority that the Senate will not ratify the Treaty, even if it is submitted to their consideration during the present Session. It is not known that the preliminary approval of the PRESIDENT has yet been obtained; and the declarations of the English Ministers may perhaps increase any hesitation which may be felt by General GRANT and Mr. FISH. The objects of the proposed Treaty are to admit certain Canadian products at reduced rates of duty into the United States, in consideration of corresponding reductions on American importations into Canada. The Secretary of the National Board of Trade of the United States, which corresponds to the English Chamber of Commerce, states in a letter to the *Times* that his Council had suggested to certain Canadian delegates "the adoption of absolute Free-trade between the United States and Canada, and of a tariff common to them both." The Canadians replied that, in addition to other objections, the establishment of a Customs Union would be unjust to England. The Americans have no intention of relaxing their tariff in favour of England; and consequently the adoption of the Treaty would involve the institution of differential duties as between English and Canadian produce. As there is no commercial treaty between England and the United States, such a discrimination, though it might be invidious and injurious to English trade, would not form a legitimate ground of remonstrance. On the other hand, if the Treaty were once signed, the Government of the United States would have no right to inquire into the terms on which English goods might be admitted into Canada; yet the imposition of equal duties would almost render nugatory the commercial policy of the United States. Experience has confirmed the probable anticipation that it would be impossible to prevent contraband trade on a frontier which extends over the whole breadth of the Continent. The Canadians have it in their power to increase the cost of English goods to themselves and to their inland customers, because it is practicable to levy at the ports all dues which may be legally imposed; but no vigilance will prevent the smuggler from underselling the regular American trader if goods on the North of the border are subject to lower duties than on the South. It is therefore indispensable for the purposes of the American Government that relaxations of the tariff on imports from Canada should be accompanied by the maintenance of the existing Canadian duties on English goods. As it could scarcely be expected that such a stipulation in a treaty would be accepted by the English Government, the PRESIDENT and his advisers might perhaps be content with a private understanding between themselves and the Canadian Ministers. Unless some kind of security is afforded for the maintenance or establishment of distinctive duties, the American Government, as long as it adheres to a policy of Protection, can have no motive for agreeing to the Reciprocity Treaty.

Lord DERRY as Foreign Minister would redeem his pledge by taking care that no clause tending to limit the

discretion of the Canadian Government and Legislature was inserted in the Treaty. A more serious responsibility might devolve on the SECRETARY for the COLONIES if the Canadian Parliament should think fit to impose or to continue exceptional duties on imports from England. The Crown has a constitutional right to refuse its assent to any Bill which may in the judgment of its advisers be injurious to Imperial interests; but Canada and other colonies have through the necessity of the case been allowed to adjust their own tariffs, often to the detriment of English trade. In Australia, if not in Canada, the doctrine of protection to native industry is widely popular; and consequently duties have been imposed on English goods, not only for purposes of revenue, but with the avowed object of discouraging commerce. If the Canadian Parliament, knowing that American produce was introduced into the Dominion at low duties, were, in pursuance of a secret undertaking, or in conformity with its own judgment of expediency, to levy higher rates on English goods, Lord CARNARVON could only overrule the decision of Canada at the risk of a dangerous controversy. The people of Canada are in a certain sense genuinely loyal to a dynasty and Government which leave them the uncontrolled management of their own affairs; but it is an understood condition that the golden link which binds the colonies to the mother-country must never hamper their movements. The Canadians would willingly admit that the authoritative mediation of the Imperial Government may be convenient and useful to control internal dissensions; but when the interests of English trade come into competition with the wishes of the colonists, sentimental attachments will not prevent the Canadians from claiming virtual independence. In truth, the modern colonial policy of England, though it has been prompted by considerations of justice and liberality, is essentially founded on the consciousness that it becomes more and more impossible to control the policy of a distant community. Statesmen have shown their wisdom in cordially recognizing a necessity to which they must in any case have submitted. Lord CARNARVON displayed less than his usual prudence in defining beforehand the line which was not to be passed by the wave of colonial independence. If the tide rises higher than on former occasions, the Imperial COUNCIL must once more move his chair higher up the beach.

Perhaps the best immediate result of recent discussions would be the postponement of the Reciprocity Treaty, especially if it is caused by the unwillingness of the Senate to relax a protective policy. The late change in the balance of parties in the United States will hereafter facilitate a gradual adoption of sounder commercial theories, although the present Congress is not likely to modify existing legislation. The more ambitious politicians would gladly induce Canada to join a Customs Union in preparation for a closer connexion in the future. With remarkable inconsistency, Protectionists often incline to an extension of the area of Free-trade when it is a consequence of territorial extension. Hereafter perhaps even American Chambers of Commerce will learn that, if Free-trade with Canada is desirable, Free-trade with the rest of the world would not be an evil. The question between England and Canada will be simplified if the American tariff is hereafter relaxed; and at the same time the advantages of special reciprocity will be proportionately diminished. If Sir EDWARD THORNTON'S statistics have any value, Canadian trade already prospers, notwithstanding the impediments which are offered to commercial intercourse with the United States. The Dominion can therefore afford to wait for a new treaty, and the Colonial Office will gladly avoid or delay the occasion of interference with Canadian legislation. If, on the other hand, the negotiation proceeds, Lord CARNARVON will do well to reconsider the assurances which he gave to the late Deputation. No Minister is held to promises which he is unable to perform. The merchants and manufacturers who may reasonably resent the possible preference of the colonists for foreigners over English traders will be powerless to oppose any policy which may approve itself to the judgment of the Canadian Parliament. The only effect of a contest would be to encourage the party which inclines to annexation, and to secure a triumph to the champions of colonial independence. There is no disgrace in acknowledging the unavoidable limitations of Imperial power. Obedience to central authority varies in some kind of inverse proportion to the distances of dependencies.

THE DUKE OF ARGYLL AND THE SCOTCH PATRONAGE ACT.

WHOEVER may hereafter be regarded as the author of the Scottish Church Patronage Act, the Duke of ARGYLL will certainly have the best title to be called its champion. The Government, having once carried their measure, were quite satisfied to make over the defence of it to a Liberal politician. Probably they were never quite able to satisfy themselves that it was the sort of Bill which a Conservative Cabinet ought to have brought forward. No doubt the Established clergy were strongly in favour of it, and to gratify the wishes of an Established clergy, wherever it can be done without making too great a political sacrifice, is in perfect harmony with the best traditions of the party. But then it has been always assumed that the wishes of an Established clergy would run in the direction of a still closer connexion with the State. Concessions to the Church were never supposed to imply any loosening of the ties that bound it to the civil power; they would rather aim at making those ties still more indissoluble. The attitude of the Scotch Church on the question was necessarily confusing to those who have been accustomed to look at ecclesiastical affairs in this light. The special favour it asked of the Government was to be let alone. It desired to appoint its own ministers instead of having them imposed by lay patrons on possibly unwilling congregations. The only difficulty in the way of such a settlement was the fact that the right of patronage was almost the only remnant of State authority left in Scotland, and that, if this were removed, the Church would be established as regards its possession of State property, and disestablished as regards its exemption from State control. It is allowable to suspect that, if the Bill had been introduced by the late Government, the Opposition would have attached great importance to this objection. As it was, the natural defenders of the most intimate possible union between Church and State were silenced by the recollection that the Bill, instead of being promoted by the Liberation Society, had been urged upon successive Administrations by the clergy themselves. If the Conservatives were wrong in voting for it, they felt that they were wrong in good company. They were supporting their Parliamentary leaders in carrying out the wishes of an Established Church. Could there be any policy more genuinely Conservative than one which admitted of being described in this way?

The controversy which has arisen between Mr. INNES and the Duke of ARGYLL since the passing of the Act is one in which only Scotchmen are likely to take a lively interest. The Duke of ARGYLL charges the Free Church with inconsistency in speaking ill of an Act of Parliament which he maintains would have satisfied all the demands of the Free Churchmen of 1843. Mr. INNES, on the other hand, maintains that the Act of 1874 reproduces in some occult way the pretensions which were found so intolerable thirty years ago. These two statements are perfectly capable of being reconciled. If the Act of 1874 had been passed before the disruption, it would have been accepted as a concession of the principal point in dispute. The State would have given way to the Church, and the Church would by that means have been saved from all complicity in any past errors for which the State might be responsible. As it was, the State refused to yield, and seduced a portion of the Church into being partaker of its sins. In the eyes of Free Churchmen no mere repeal of the obnoxious statute can undo wrongs of this nature. They would like to see some public humiliation undergone alike by the State and the Church. To repeal an Act seems to involve an admission that, while it was unrepealed, it might have been lawfully obeyed; whereas the position newly taken up by the Free Church insists that there ought to be some kind of formal declaration that to pass such an Act was *ultra vires* on the part of the State, while it involved grievous spiritual degradation on the part of the Church which assented to it. The least, therefore, that would have satisfied the Free Church leaders, when it was announced that the law was to be altered, was a confession that Parliament had been wrong in passing the Act of 1843, and that the Established Church had been wrong in living under it for so many years. It is not enough, they insist, for the Church of Scotland to say, "Whereas I was blind now I see." Her blindness has been too wilful to allow of her being let off thus easily. The Patronage Act, if it has any meaning

at all to Free Churchmen, must mean that the policy which drove them out has at length been abandoned as wrong in principle. In their opinion the proper corollary to this is the admission, that ever since 1843 the Free Church has been the true Church of Scotland. The members of the Established Church naturally take a different view of the Patronage Act. They regard the system of private patronage, not as an iniquity to which they have till now been consenting, but as a burden from which they have but now been set free. The change in the law of patronage can work no change in the opinion held by the Free and the Established Churches respectively as to the right and wrong of the secession of 1843. The fact that the law is no longer calculated to offend Free Churchmen will not make their action in leaving the Church rather than submit to the law as it stood formerly less an act of schism in the eyes of members of the Established Church. The fact that the Established Church is no longer subject to a system of patronage which, in the eyes of the Free Churchman, is a denial of the Supreme Headship of CHRIST, does not make her the less responsible for submitting to such a system so long as Parliament chose to impose it on her. The Duke of ARGYLL overlooks the important consideration that, from whichever side the question is approached, a question of religious morality is involved in it. It is the refusal to regard private patronage as something forbidden by the Divine law that constitutes the real sin of the Established Church on one theory. It is the deliberate choice of secession as a lesser evil than acquiescence in a state of things which if inexpedient, was not of necessity wrong, that constitutes the real sin of the Free Church on the other theory. The Duke of ARGYLL seems to think that he has landed the Free Church in a dilemma when he has proved that, if what has now been conceded had been conceded in 1843, it would have been held sufficient by the Free Church leaders. Either, he argues, they would have been satisfied with too little, or you ask too much. But in 1843 the divergence of principle between the two parties in the Church had not been disclosed. If the Act of last Session had been passed at that time, the State would have been held to have failed in an impious attempt to place the Church in fetters. That is a wholly different condition of affairs from one in which the Church sits contentedly in chains for a whole generation, and even then accepts her release as a favour, not as an act of justice. In the former case the Free Church principles would have triumphed, though there had not been a single seceder. In the latter case the Free Church principle cannot triumph under any conditions short of confession and restitution on the part of the Established Church.

The conclusion of the controversy seems to be that the most modest defence of the Patronage Act is the most successful. It is not a measure of comprehension; it sets up no new bulwarks for the Established Church; it does not aim at restoring unity to Presbyterian Scotland; it touches no question of principle even in the religious community to which its provisions apply. It simply involves the surrender by private patrons and by the Crown of a right which had become nearly valueless, and for that reason had ceased to yield any adequate return for the heart-burnings and ill will which its exercise occasionally created. The true answer to the contemptuous criticisms of the Free Church upon the smallness of the measure is that it concerns no one except the members of the Established Church. If it had arrogated to itself the more majestic proportions with which the Duke of ARGYLL seeks to invest it, Free Churchmen would have had a right to find fault with it. As it is, they must content themselves with denouncing the religious feebleness of a body which can congratulate itself on so paltry a concession. The history of the Patronage Act may furnish a useful warning to the advocates of ecclesiastical comprehension in England. Parliament may succeed, if it works hard enough, in turning this or that section of opinion out of the Established Church, but nothing that it can do will have any effect in bringing into the Established Church bodies which are now outside it. Religious establishments may last a long time yet if they are let alone, but attempts to galvanize them into embracing all the world will certainly fail, and will probably involve unforeseen and fatal injuries to the fabric which they are designed to strengthen.

STAGE DECORUM.

THE morality of the stage can never be a matter of indifference to those who understand the insidious and widespread influence which it exercises on all classes, and especially on the more thoughtless, ignorant, and impressionable sections of society. The regular frequenters of the theatre may not form perhaps a very large proportion of the community, but the influence of the performances extends far beyond those who actually witness them. They give a turn to thought and conversation, and looseness on the stage, while it may be supposed to be in some degree a reflex, is also an active cause, of a corresponding looseness in actual life. There could hardly be a more striking and unpleasant illustration of this than the way in which the name and idea of a vicious French dance, which indeed is only an imitation of the crude and shameless profligacy of the lowest savages, have been added to the stock of mentionable subjects. Anybody, as the *Times* remarks with unfortunately too much truth, can now talk about a can-can as freely as about a quadrille. This emancipation from the restraints of conventional prudery is a result which certainly deserves serious reflection. The next step would naturally be the introduction of the can-can itself into the drawing-room. This dance is sometimes surreptitiously performed in France behind the backs of the police in the lower sort of saloons frequented by students and grisettes, but it has never been tolerated in a French theatre or any place of public amusement. A French gentleman who has any pretensions to good breeding would be ashamed to utter the word in society, and it would be an insult to a lady to suppose that she could possibly ever have even heard of it. Yet in the capital of England—moral, respectable England, which shakes its head at French vice and mourns over French grossness—this dance might, until recently, have been seen almost any night in half a dozen London theatres, and its name may be said to have been adopted into our domestic tongue. It is of course unnecessary to exaggerate the direct effects of this unsavoury importation. It is probable that it has been witnessed by many persons who in their innocence failed to discover its intentional suggestiveness, and we prefer to believe that some of those who talk of it so glibly have only a faint appreciation of what it really means. But that it should be talked of at all is evil, because it leads to coarseness even where it does not stimulate vice. The purity of public manners requires to be sustained by the decency of common conversation. It is satisfactory to know that the Censor has, for the present at least, cleared the stage of this pollution, but a jealous watch will have to be kept in order to prevent its recurrence. That it should ever have been introduced is a public disgrace.

We are disposed to think that, as a rule, when scandals of this kind cannot be prevented, it is well to take as little notice of them as possible. This, however, is a case in which it is evident that repression can be employed, and the *Times* has very properly called attention to it, adopting as its own the protest of a correspondent against the license of costume, or rather of nudity, on the part of a certain class of performers—not actresses, for they cannot act or speak or sing—who may be called, for want of a better name, expositors of their persons. It is obvious that, if it is worth while to have a Censorship at all, it is necessary that it should be made practically effective. This can only be done by obtaining for the Censor the support of opinion, and it is well therefore that public attention should be forcibly directed to the subject. It cannot be denied that there are at this moment theatres in London to which “no modest woman can take her girls, and still less her boys, without a sense of shame and disgust”; but it would be unjust to attribute this deplorable license to the theatres generally. On the contrary, there are various symptoms of an elevation, which we hope we are not too sanguine in thinking may be progressive, in the character of the drama of the day. Burlesque of the old gross tom-fool kind has for some time been steadily declining. The school of social comedy which Mr. Robertson brought into favour is, if not intellectually strong, at least intelligent and decorous in the extreme, and may almost be said to err on the side of insipid respectability. The addition of music to qualify the absurdities of farce may be regarded as a step upwards in artistic refinement; and it is impossible not to be struck with the disposition of audiences to welcome any experiment in a more thoughtful and poetical cast

of plays. *Hamlet* is at this moment the most popular of all dramatic works, and, tempted by the example, other Shakspearian plays are to be produced at other houses. There are more than a dozen theatres in London where any mother may take her sons or daughters without running any risk of being put to the blush. At one house there is a gorgeous but intensely stupid historical spectacle; at four houses there is a choice of comedies of society; four offer the picturesque and romantic drama; while yet other four are devoted to musical comedies or farces of the new kind. These performances are of course of very various merit; but they agree at least in this, that there is, as far as we are aware, nothing morally objectionable in any of them. In point of fact, there are only two, or perhaps three, theatres in town which lay themselves out for burlesques or extravaganzas of the kind against which a protest has just been raised; and at one of these no doubt the offence is rank. In this instance an attempt has been made to give interest to a burlesque, which in itself can only be described as idiotic, by exhibiting a number of women in a state of semi-nudity. The principle of the management would seem to be that of Mr. Pitt's friend, the Viscount, that human nature is best represented by lots of legs; and the scandal is in some degree magnified by the example which the manageress herself sets in the free and unabashed display of her undraped figure. This exhibition of a big woman who appears to be wholly unclothed except for about a foot and a half round her middle is one which may be commended to the attention of the Censor. It is impossible to imagine anything more outrageously disgusting. It is a sort of indecent exposure which is, in fact, a police offence.

Although we are disposed to think that the majority of the theatres may, at any rate as they are at present conducted, be exempted from a general indictment of indecency, this is no reason why the Censor should not exercise his authority in the most forcible way against the offending minority. Indeed it may be said that it rather strengthens the case for intervention, inasmuch as it makes intervention more hopeful. If there is as strong a feeling on the part of the profession against these performances as there is on the part of the public, no great difficulty need be anticipated in suppressing them, or at least compelling the effacement of their most offensive features. It cannot be doubted that it is in the interest of genuine art that resolute measures should be used to clear the stage of the models of the studio, and the lay figures of lascivious *poses plastiques*. When a taint of this kind breaks out it has a tendency to spread. It frightens respectable persons away from an honourable profession, it attracts disreputable persons towards it, and it tempts people who have no preference for impropriety in itself to try how far they can go in competition with it. Nothing can be more sadly significant than the representation of the theatrical profession which is exhibited in the windows of the photograph shops. Who are the young persons with fantastic hair and very low-bodied dresses who are there depicted? Are they actresses capable of articulate speech or of the faintest kind of histrionic personation? Can they dance or sing? Certainly not; yet they form the chief part of the staff of certain theatres, where they are produced for show like an exhibition of cattle. In many cases they are women who find in this sort of publicity a useful advertisement of another trade. It is needless to say that the growth of such parasites degrades and corrupts the profession on which they fasten, and drives decent people from it. Not only what the *Times* calls the best class of the playgoing public, but the best class of players, will be thankful for a vigorous and sustained attempt to relieve the stage from this infectious canker. It may be pleaded that the Censor has nothing whatever to do with the private life of public performers, and this is undoubtedly true. But he has at least a right, and it is his duty, to take care as far as he can that the public performances of this class of women shall not too openly suggest their private avocations. Those who are old enough to remember the state of the theatres soon after the accession of the QUEEN will always be grateful to her for the purification which she was the means of accomplishing; but unfortunately her seclusion in recent years has led to a partial renewal of old scandals and abuses. There is no one to lead the public taste and to vindicate

public decorum in such matters, and those who might, in the absence of the Sovereign, be expected to set an example, rather encourage the evil by the too good-natured impartiality of their patronage. It is some consolation, however, to know that the new Censor has received instructions to make his authority a reality, and that the actual representation of plays on the stage is to be looked at as closely as the language of the dialogue.

GREECE IN ITALY.

THE shores of the Bay of Naples and of the two bays which stretch north-west and south-east on either side of it have their attractions for all. There is the mere natural aspect, the land and the sea, the coast, the mountains, and the islands—the heights of Capri and of Ischia anchored as it were like guard-ships before the peaceful bay—Vesuvius, with its pillar of cloud, reminder of fearful days when the pillar of cloud has been changed into a pillar of fire. There are the long associations of the history of that memorable coast, Oscan, Roman, Byzantine, Norman. We look on a land which formed one of the fairest spots in the fairest realm of the Wonder of the World, a land which in our day was wrested from the oppressor by exploits more wonderful than any of which its own long history had to tell. We look on the city stretching along the shore, the city for which so many lords and so many nations have striven, and we hasten back from the struggles of Bourbon and Habsburg, of Anjou and Aragon, to the days when the Norman added to his realm the first and last possession of the Eastern Cæsar in the Western seas, when the city which had been won by Belisarius yielded to the arms of Roger. We cast our eye along the coast, and every inch of ground seems to have its special association for the student of the early Imperial days of Rome. Here almost every famous man of the late Republic and the early Empire had his retreat from the honours and the cares of Rome. On one side of the great bay we are shown the villa of Cæsar and the villa of Lucullus; we see too the scene of the wildest freak of Cains and of the blackest crime of Nero. On the other side is the sea-side home of Cicero, a contrast indeed to his airy Tusculum, and there is the spot where Pliny, father of a long line of scientific admirals, gave his life as the price of the knowledge which he loved. And, in the midst, to remind us of the greatest of all changes, we see the spot where Paul of Tarsus looked on the now ruined temples and amphitheatre of Puteoli. And, as if purposely to embody that remembrance, there is the height crowned by the *duomo*, worthless in itself, but which becomes a speaking memory indeed when we see built into its wall the columns of the temple which looked down on the Apostle as he landed, the temple of the deified founder of that Empire whose chiefs were, under the teaching of the faith which he brought with him, to change from the High Pontiffs of the old idolatry into the Advocates of the Universal Church. It is well that, in a region made so fair by the hand of nature, so foul by the deeds of man, there should be this one link to bind our thoughts to other and higher things than the evil deeds of the early Cæsars. And yet there is a relief of another kind; here is the region to which poetic fancy has transferred so many of the old thoughts and names and legends of the older Hellenic days. Here we are in the land of Virgil; here is Misenum, there is Avernus, a lake at least of higher memories than its Lucrine neighbour. And thus we are carried back by the wand of the Mantuan magician to thoughts of the earliest times of which that land awakens memories. We may begin to remember that the living Neapolis, the buried Hêrakleia, were not, in their beginning, cities of the Roman or of the Oscan. Here again, as in other lands, a cycle has been played out. When Belisarius entered Naples, he entered it as a Roman general victorious over the Goth. What in truth he did was to win back for the new Greek world a city which had been part of the elder one. If Naples so long remained a distant outpost of Byzantium, we have but to double the Cape of Misenum, to pass along the coast which parts the grave of Æneâs's trumpeter from the grave of his nurse, and we light on a spot more truly memorable in the history of the world than any of the spots renowned for the crimes or the victories of Kings and Cæsars. The Apostle himself, citizen of a Greek city, putting forth his teaching in the Greek tongue and enriching it with Greek associations, must have found some other form for the Gospel which he preached, had not the Greek of earlier days spread his tongue and his philosophy through all lands. We may for a moment forget all that has happened from the first alliance between Rome and Capua to the modern deliverance of Capua and Rome, as we look on the first outposts of Hellas in the West. As we stand on the acropolis of Cumæ, what we elsewhere look on as ancient seems to belong to the old age of the world. From that desolate height we can drink in the fullness of the fresh breezes of the youth of Europe and of European man.

It is a feeling which indeed carries us out of the common world and of the common range of history, when we can say for the first time that the soil on which we tread is Hellas. We need not say that, wherever Hellenes dwelled, there was Hellas, and that the furthest outpost in the Iberian or the Tauric peninsula was as truly Hellas as Sparta or Athens. So, in this sense, Neapolis and Massalia were Hellas also, but from them the fatal gift of long-continued prosperity has wiped away the Hellenic character.

Cumæ—let us rather cast aside the barbaric form, and give back her true name to Æolic Kymê—has had the luck to perish, and in perishing she has kept all the old associations of her name. True, the traces of her Hellenic days are of the very scantiest; but there are no traces of other days to interfere with them. We pass by the shore of Avernus and through the vast tunnel of Agrippa, or we trace the Roman pavement through the bold span of *Arco Felice*, and, when the other side of the hill is reached, we leave Rome and the younger world behind us. Straight before our eyes, rising above vineyards and scattered cottages, soars the hill of the acropolis, the first point, as tradition told, of Italy and the Western world in which Hellenic settlers found themselves a home. If the tale be true, Sicily and Korkyra, the sites of Sybaris and Taras, were still barbaric ground, untrodden by an Hellenic foot, when the first colonists from the eastern Kymê lighted their fires and raised their first defences on that solitary hill. A coast, already Hellenic in its natural character, a coast of bays and islands and promontories, stretched far on either side, but all on either side was strange, all was barbarian. It was for them to win for the Hellenic name a land on which nature seemed to have set her seal as a destined dwelling-place of Hellenic man. And, be the tale true or false which makes Kymê absolutely the first Greek settlement on the western seas, there can be no doubt that it was a settlement of very high antiquity, a settlement made in days when the earliest type of city was still the rule. Kymê is a hill-fort; its acropolis overhangs the sea, but the sea is not immediately at its foot. Such was the kind of site chosen for the most ancient cities in Greece itself, and a wide gap parts a city of this kind from Naples on her bay and Syracuse on her island. Kymê was a part of Hellas; but, when Kymê first arose, it was indeed a small and isolated fragment of Hellas that she formed. The first object of her settlers was defence against barbarian neighbours, and they found it on such a site as their barbarian neighbours loved. The acropolis of Kymê suggests the *arx* of Tusculum, and a strange companionship unites the two. Even here, on the oldest site of Italian Hellas, we cannot wholly shut out the memory of Rome. Tusculum and Kymê alike, so the story goes, gave shelter to the King whom Rome had driven out. When the arms of the Thirty Cities had failed to restore the banished Tarquin, Kymê, or at least her tyrant Aristodêmos, welcomed him to a refuge beyond the reach of the newborn commonwealth by the Tiber. The last shelter of the fallen King, the Greek acropolis, less lofty than the Latin *arx*, was hardly less strong. And on the side of it away from the friendly sea, the side most open to the inroads of barbarians, the hill was scaped away and strengthened by mighty stones worthy to have found a place in the oldest wall of the city from which Tarquinus had been driven.

The thought of this strange episode in the history of the Greek city may perhaps present itself to the mind; but there is nothing left on the height of Kymê specially to call up the memory of Aristodêmos and his guest. It is one of the charms of the scene that so little is left of any kind, that the desolation of Kymê is almost as complete as the desolation of the spot could have been before Kymê was. There is nothing to interfere with our musings. Some slight traces of the great temple of the patron-god Apollo may be made out on the highest point, but his columns are gone; they have been stolen by some of the bandit princes, prelates, and potentates who have wrought their wicked will on the monuments of Italy; they have been carried off to adorn some villa or palace or museum, and are no doubt duly ticketed to record the "munificence" of the robber. We have forgotten the name of the savage and the whereabouts of his lair, and we are not to search them out again. Kymê is desolate, save the mighty stones of her wall and the small traces of her temple; a few remains too of Roman brick-work, to be seen as we pass from one to the other, survive from the days when Kymê had paid the penalty of sheltering Rome's banished tyrant. Here and there too, in the vineyard or by the pathway, we see some scrap of wall, some fragment of carved work, to show that a city has been there. But we read the history of Kymê, as we stand on her height, and look out on the hills, the flats, the lake, and that great and wide sea which made Europe to differ from Africa and Asia, and which gave the Hellenic man power to spread Hellas, and all that is implied in her name, over every coast where his once worthy barbarian rival had not forestalled him.

We change the scene to another spot on the same coast, on the other side of the central city, where we are still on Hellenic ground, and where the men of Hellas have left signs of their presence which have outlived all the works of successive waves of conquerors. We set forth from Naples; we pass along the

Vicina Vesuvo
Ora Jugo;—

"jugum" no longer, since the cities at its base were preserved for posterity by their overthrow. We pass by spots famous in the history of after-days. We pass by Angri; hard by is the mountain-slope where the great struggle of Italian history was ended—the scene of the last fight of Teias and Narses, where the last Gothic King sank beneath the arms of the mighty eunuch, and where it was fixed for ever that Italy should not become a national kingdom under a Teutonic King. We pass on by Nocera and Pagani, names which speak of the great house under whom Italy had again a change of masters; we call up Frederick and Manfred, and those faithful Saracens who died around their King at Benevento when his Christian warriors had forsaken him. And, if Nocera

speaks to us of the most renowned of Emperors, Salerno on its bay speaks to us no less of the most renowned of Pontiffs. There, like Scipio at Litternum, Gregory died, as he deemed, in exile, though there were those around him who deemed that the Vicar of Christ could be an exile in no spot of the earth whose utmost parts were given him for his possession. Through spots like these, where the great events of man's history press upon us at every step, we fly away, as it were, from the modern world, the world of Rome and all that sprang from her, to see another spot where all that is left speaks to us of the days of the world's youth, and speaks to us with a clearer voice than the desolate hill of Kymé. On no hill-top, but on a dreary flat between the sea and the mountains, the temples of Poseidónia, Præstum on Latin tongues, still stand, a wreck indeed of what they once were, but a wreck which seems perfect beside the far more utter wreck of the works of so many later ages. Yet we feel that, ancient as Poseidónia seems, it is young beside Kymé. There is again before us the same difference as that which divides Dardanië from Ilios, and Tusculum from Rome. Things must have greatly changed since the foundation of Kymé before Greek settlers on Italian soil could have fixed themselves on such a spot as Poseidónia. Here was no acropolis, no inaccessible height; the colonists trusted to their walls, to the sea, to the natural superiority of the Greek over the barbarian. The change involves all the difference between the first solitary Greek settlement in the West, the colony which came straight from the Asiatic shore, and the colony whose metropolis was itself on Italian ground, the city planted by Sybaris in the days of her power, when southern Italy had won the name of the Greater Hellas. Kymé is primarily a fortress; Poseidónia is essentially a city. Like other cities, it needed defence, but defence was not the one object present to the mind of its founders. There was no rock to scarp, or, in trust in its natural strength, to leave unscarped, but simply such a space as was needed to be fenced in by the mighty Hellenic walls, which, broken down and overgrown as they are, may still be traced and walked on through nearly the whole of their pentagonal range. Within these walls a crowd of later buildings have risen and fallen; the theatre, the amphitheatre—the sanctuary of Roman cruelty thrusting itself within the Hellenic city—the temple of Roman date, may all be traced, and it would be a good deed to set the spade to work to dig them out more thoroughly; yet it is with a certain pleasure that we see the amphitheatre and the Roman temple level with the ground, while the Hellenic temples still raise their mighty columns above the fallen works of the barbarian conqueror. Few buildings are more familiar than the temples of Præstum; yet the moment when the traveller first comes in sight of works of untouched Hellenic skill is one which is simply overwhelming. Suddenly, by the side of a dreary road, in a spot backed indeed by noble mountains, but having no charm of its own, we come on these works, unrivalled on our side of the Adriatic and the Messenian straits, standing, in all their solitary grandeur, shattered indeed, but far more perfect than the mass of ruined buildings of later days. The feeling of being brought near to Hellenic days and Hellenic men, of standing face to face with the fathers of the world's civilization, is one which can never pass away. Descriptions, pictures, models, all fail; they give us the outward form; they cannot give us the true life, the thought that we have passed away from that Roman world out of which our own world has sprung, into that earlier and fresher and brighter world by which Rome and ourselves have been so deeply influenced, but out of which neither the Roman nor the modern world can be said to spring. There is the true Doric in its earliest form, in all its unmixed and simple majesty. The ground is strewn with shells and covered with acanthus-leaves, but no shell had suggested the Ionic volute, no acanthus-leaf had suggested the Corinthian foliage. The vast columns, with their sudden tapering, the overhanging capitals, the stern square abacus, all betoken the infancy of art. But it is an infancy like that of their own Héraklès; the strength which clutched the serpent in his cradle is there in every stone. Later improvements, the improvements of Athenian skill, have added grace; but for the sense of power, of simplicity without rudeness, Poseidónia holds its own. Unlike in every detail, there is in these wonderful works of early Greek art a spirit akin to some of the great churches of Romanesque date, simple, massive, unadorned, like the Poseidónian Doric. And they show too how far the ancient architects were from that slavish bondage to minute rules which moderns have invented for them. In each of the three temples of Præstum differences both of detail and of arrangement may be marked, differences partly of age, but also partly of taste. And some other thoughts are brought forcibly upon the mind. Here indeed we feel that the wonders of Hellenic architecture are things to kindle our admiration, nay our reverence, but that, as the expression of a state of things which has wholly passed away, nothing can be less fit for reproduction in modern times. And again, we may be sure that the admiration and reverence which they may awaken in the mind of the mere classical purist is cold beside that which they kindle in the mind which can run over the successive steps in the long series by which the massive columns and entablatures of Præstum grew into the tall clusters and soaring arches of Westminster and Amiens.

DOG SHOWS.

PERHAPS it may be safely said that few persons who visited the Birmingham Dog Show during the past week were in a strictly philosophic state of mind. The "cherub Contemplation" seldom "soars on golden wing" above the heads of the interesting but rather noisy victims of their masters' vanity. Thought of the profounder kind is not easy when one's head is splitting with the animated conversation of the frolic terriers, and the calves of one's legs are quivering irrefragably in the neighbourhood of the huge jaws of some monstrous bulldog or mastiff. Doubtless if the channels of communication between the human and the canine intellects were a little more open, one might gather the germs of many wise reflections from the intelligent animals who look upon the world from a point of view so radically different from our own. Doggish sermons upon the value of fidelity, courage, and high-mindedness have been impressively uttered from the days of Ulysses to our own. Unluckily the preaching has been of the inarticulate kind; and we must therefore be content with such interpretations as we can devise for ourselves. Indeed we may infer that, if dogs could talk, they would differ from each other nearly as much as rival theologians or men of science. The theories of life and manners which respectively commend themselves to a lapdog and to a bloodhound must be radically different. Dogs may be regarded as visible symbols, verging sometimes upon caricature, of the tendencies existing amongst their masters. The differences of temperament and constitution which in the human race seem chiefly to affect the brain are embodied in the whole physical structure of the dog. It is no mere fanciful analogy which leads us to trace a resemblance to human physiognomies in the various breeds of dog. The dog of civilization has been moulded by the taste of his proprietor just as distinctly as any other work of art. The shape of a bulldog's head indicates the tastes of the order of society by which he is patronized quite as clearly as the carvings of a mediæval cathedral show us the tastes of its architects. The bulldog is simply a grotesque gargoyle formed in flesh and blood instead of stone. The dog of civilization differs from his savage ancestor as Rousseau differed from the man of nature whose praises he was accustomed to sing.

Mr. Mill's posthumous essay has drawn attention to the vagueness with which the word Nature has been generally used. He might have illustrated one at least of its meanings with great clearness from the phenomena of a dog show. The dog of nature is the dog which would still be able to get his living and maintain his breed if he were turned loose by himself in the wilderness and deprived of human care. The civilized dog is an animal which could not shift for himself, and would certainly die out in a generation or two. The meaning generally attached to the "state of nature" by Rousseau and his followers was of an analogous kind. The civilized human being is part of a huge organization, with which his existence is so intimately bound up that he would be as useless without it as a single wheel taken from a piece of complex machinery. In *Sandford and Merton* we used to read how, a fine gentleman and a common peasant being turned out among savages, the fine gentleman was despised because he could only make pretty speeches, whilst the peasant was made into a prince because he was able to weave baskets. The inference of the ingenious author was the very illogical one that modern society was corrupt because it honoured qualities which were useless in a savage community. As the great principle of all progress is the organization of various talents, it inevitably follows that individuals must have in some sense a one-sided development. Amongst human beings, however, the result is, or ought to be, the cultivation of qualities which are not the less valuable because they are not adapted to meet the pressing material needs of society. Newton was not the less an admirable product because he would perhaps have been quite incapable of digging roots or catching fish in a society which cared nothing for astronomy. It is true, however, that many talents which are cultivated in a complex social order are of very little good to anybody, or, it may be, are positively deleterious. And, in the case of dogs, it must be admitted that this tendency seems to be illustrated more frequently than the other. Occasionally we may find that the civilized dog differs from the dog of nature by having cultivated some really valuable quality without losing in general vigour. A sheepdog, for example, is an animal who deserves the highest respect for virtues and talents in which he exceeds many featherless bipeds. He has possibly lost some of the wild instincts which would enable him to preserve the species if he were simply turned loose on a moor; but he is still a perfect model of activity and vigour, and has acquired talents which enable him to be regarded as a valuable member of the community. But too large a proportion of the dogs in a show must unfortunately be regarded rather as embodiments of a taste artificial in the worst sense—that is to say, of a taste which is rather prejudicial than otherwise to the highest moral and intellectual development. If dog-fanciers were generally endowed with a sense of beauty as vivid as that of the ancient Greeks, they would endeavour to produce a breed of dogs which should be models of strength, speed, and vitality. The art of moulding flesh and blood into its noblest shapes would be studied in the same spirit as the art of carving stone. When a dog is required to hunt, to keep sheep, or even to guard a house, some attention is paid to the laws which determine the perfection of animal symmetry. But for the most part the fancier is ignorant or indifferent, and makes a poor dog a mere symbol of

arbitrary and grotesque fancy by exaggerating some particular feature, irrespectively of canine happiness or of utility to man. The miserable creatures called toy-terriers, trembling and fretful dwarfs, are really, as it seems to us, a disgrace to their breeders. If it is wrong, as Malthusians tell us, to bring into the world a set of human beings irretrievably destined to disease and vice, it is surely wrong in a minor degree to breed animals whose life can only be a long disease. The modern bulldog represents another absurd freak of fancy. So long as he could be applied to a legitimate purpose, there was doubtless much to be said for him. When baiting animals was regarded as a legitimate application of human energy, the bulldog was at least in harmony with the social order in which he lived. But, if we may judge from the grotesque monsters whom we have seen, not without a shudder, leering with red eyes at our legs, we fancy that the true end of bulldog existence is being forgotten, and that it has become an ultimate purpose with fanciers to make their noses as short and their lower jaws as long as possible, till the poor creatures are in flesh and blood what a Chinese grotesque is on porcelain.

It is impossible to see these animals without recognizing them as typical examples of tendencies which are really moulding men as well as dogs. The toy-terrier is the modern postaster. He is a feeble creature, all run to nerves and excessive irritability; incapable of really strong passions, though getting up a feverish imitation of them; unhappy unless he is petted by his mistress and wrapped in the softest of coverings; intensely fretful under criticism, and apt, if he sees a chance, to revenge himself by snapping at his enemy's fingers; and given to regard the world as a troublesome sort of place where the only consolation obtainable is the consumption of a good many *bombons* and scraps of highly-flavoured though unhealthy food. What there is in one class of society of this overstrung nervous excitability generates dainty poetry varying between the namby-pamby and the prurient, and in another produces toy-terriers and weakly lapdogs. The bulldog has analogues as clearly resembling him. He is the modern rough. In older and coarser days he had his value; he was useful as a soldier, when war required less intelligence and more brutal obstinacy; and might be useful enough on some savage frontier where it was desirable that the strongest races should stamp out their feeble rivals. He still possesses qualities of courage and stamina which can never quite lose their value, and he may therefore be indirectly useful as a cross for other breeds. But in his own capacity he is now a mere anomaly—a survival of a form which has ceased to correspond to any real needs of society. The bulldog, we believe, is better than he looks, and is often a very amiable creature in private life; but, so far as his physical conformation goes, he evidently represents amongst dogs the same element which in human society produces wife-beating, garrotting, and other habits to which we pay too high a compliment when we call them brutal.

It would be easy to pursue the argument in regard to other varieties. Who can see a bloodhound, the most dignified in appearance of all the brute creation, but just so far suffering from the decay of his profession that his appearance is beginning to be cultivated at the expense of his utility, without thinking of a high-bred noble in a demoralized country, and almost expecting to hear that he suffers from the gout? Or a good, sturdy, wiry Scotch terrier without seeing in him the reflection of a long line of stubborn Calvinists of the Davie Deans variety? Or any of the retrievers and setters and pointers without wondering whether they or the country squires, their masters, are really the more intelligent and valuable members of creation? On the whole indeed the impression which we receive from such a show is rather to cloy the dog at the expense of his master. The raw material has so many charms that we are annoyed by the deformities which have been grafted upon it. The genuine dog is so charming a creature, so much affection and intelligence looks out of his honest eyes, he is so splendid a specimen of courage, endurance, and activity, that we feel ourselves the better for his acquaintance. Admitting that we sometimes invest him with imaginary virtues, he has yet the germs of most of the qualities which go to make a noble character. And therefore it is irritating to see how frequently his excellent qualities are obscured in proportion to the closeness of his connexion with human beings. If the managers of dog shows wish to benefit the creatures whom they exhibit, they should do what they can to encourage a higher standard of taste in such matters, and should reward dogs in proportion to their strength and utility, rather than to the degree of their approximation to some arbitrary standard. Unluckily, here, as elsewhere, it is a weakness of the competitive system that it sets undue value on the qualities which can be easily measured as compared with those which are really serviceable; and we need not be surprised that a people which values men more for a capacity of reproducing second-hand knowledge than for more solid and less ascertainable virtues should value dogs for the shortness or length of their noses more than for their powers of scent or their general vigour. We could only wish that the human qualities which we seek to stimulate were represented by some external peculiarities of conformation, when perhaps we should recognize the comparative worthlessness of some systems of education.

ST. PAUL'S UNCOMPLETED.

THE *Times* of Saturday last is of opinion that the Executive Committee for the Completion of St. Paul's came to a "somewhat clouded conclusion" on the preceding day. We are not aware whether that respectable body made choice of the paper which has hitherto been foremost in its opposition to everything upon which the Committee set its heart as the depository of its confidential debates in hopes of eliciting that judicious observation. It would, to be sure, appear, by a letter from a member of the Committee which was subsequently sent to the *Times*, that that body had begun with a "somewhat clouded conclusion" as to the extent to which it was willing to abandon its freedom of confidential deliberation. Be that, however, as it may, we are far more inclined to agree with this remark of the *Times* than we have often been when we have been unlucky enough to come into collision with it on the explosive subject of St. Paul's.

So far as we can pierce the fog, the condition under which the Committee met seems to have been that the Chapter, in face of the well-nursed outcry against Mr. Burges's design, passed a resolution in favour of postponing the active commencement of the work of decoration, in the expediency of which resolution we believe that not only Mr. Burges's friends, but that gentleman himself, cheerfully acquiesced. With this postponement of the substantive work went also one of an experimental and temporary colouring of the East end. The Chapter came to a third resolution—that the agreement under which Mr. Burges and Mr. Penrose had been artificially yoked together in the undertaking ought to be rescinded, as it was "found to be highly inconvenient in its working." No one, it was understood, was more conscious of this than Mr. Burges himself, and the necessity of revising the terms of agreement whenever work should be resumed was a foregone conclusion. Such revision could only proceed by way of rescinding the existing document. But, the very fact that work was not to be resumed for an indefinite period minimized the practical importance of any immediate revision or rescinding, and left the Committee free to adopt the opportune time for the step. The Chapter (which, it must be remembered, is the one legal body having the authority under which it has invited the Committee to offer its voluntary assistance) has, no doubt, sufficient grounds for condemning an agreement under which it conceived itself inconvenienced. But it had voluntarily associated the Committee with itself in so much of labour and responsibility as to have contracted an honourable obligation to listen to the reasons of its fellow-worker. The Committee would not have been justified before a court of honour in insisting upon the maintenance of that agreement in face of the Chapter's recorded experience. It would have been acting up to the reasons of its own existence in proposing a time and a way of carrying out the decision of the Chapter which should not prejudice other interests for which it had made itself responsible. Now it happened that the agreement, with all its faults, was Mr. Burges's one patent of office. He was and is the Committee's architect by an unrescinded vote. But this is a barren honour. The power of doing anything could only come to him from the Chapter; and it had come to him in the form of that agreement. He was the choice of the majority of the Committee, and nothing has been alleged to show that that majority thinks itself mistaken in the selection of an architect, although for the sake of peace it readily acquiesced in the proposed delay. It would have been the natural course, if pacification and a breathing time were the object sought for, to make the suspension impartial and complete on all sides. So long as the Chapter, backed by an acquiescent Committee, delayed active operations, Mr. Burges would have obtained no more real power over the Cathedral by his title of architect of its completion than the King of Italy enjoys over the Levant by virtue of his style of King of Cyprus and Jerusalem. Mr. Burges's retention of the appointment would, however, have visibly exonerated him for the future from the possibility of imputations, not only upon his artistic capacity and knowledge of the art which he professes to exercise, but actually upon his professional trustworthiness, which the Committee, unless endowed with a preternatural shortness of memory, ought to have been warned by past experience to guard against. It must not be forgotten that, in the heat of the controversy which raged round Mr. Burges's models, imputations were directly aimed at him for wilfully neglecting, or rather disobeying, the instructions which he had received from his employers as to the choice of style which he was expected to follow. The letter which he laid before the Committee on Friday week, and which the *Times* very properly reprints, was a brief but conclusive reply to the charge which called for some acknowledgment on the part of those to whom it was addressed. It likewise explained that Mr. Burges was actually engaged in preparing drawings undertaken at the order of the Committee, which had been so far advanced as to make their completion a matter of financial necessity, while he was likewise revising the existing models. With these facts before the Committee, neither of which had come under the cognizance of the Chapter, the reasons for its acceding to the policy of postponement were infinitely strengthened. Their refusal to do so might, by unscrupulous adversaries, be taken to imply that they did not really think their architect clear of those charges, nor really accepted his explanation; while the advice on one hand to lose no time in rescinding the agreement, and the determination on the other not to forego the benefit of the half-completed drawings, or of the revision of the models, which, emanating as they do from

an already rescinded architect, could hardly lead to much practical good, might easily be distorted into a charge of wanting to squeeze as much as possible out of their man. The postponement of the rescinding, coupled with that of the actual decoration, would at once have honourably acquitted the architect from injurious imputations, and have enabled the Committee with self-respect to accept those preliminary drawings which it still holds Mr. Burgess bound to complete. We should be much surprised if the Executive Committee, on calmer reflection, saw reason for much self-satisfaction. It had deliberately selected Mr. Burgess as its architect; it had sustained him against turbulent, bitter, and unreasoning opposition; it has not even now cancelled his appointment as its architect; and still it was of one mind with the Chapter as to adjourning any practical use it should make of the time, abilities, and study he had devoted to the appointed work. It had further to judge whether it would confirm this pacific interim, or whether, by mechanically echoing the Chapter's call for a naked rescinding of the agreement, under circumstances which would totally alter the meaning of the proceeding, it would depute that body to suppress the man whom it had honoured, and whom it still professed to honour. The suggestion of putting an end to the agreement was as it came from the Chapter the undeniable statement of a difficulty which was practical or theoretical according as the works were active or passive. The echo of the suggestion on the part of the Committee after all that had taken place, and in face of the covenanted cessation of active decoration, would be tantamount to a penal dismissal of Mr. Burgess. Yet the Committee by a large majority closed with the latter alternative. We are willing to believe that all who voted for the proposal could not have appreciated its bearings, and that it was in more than one sense a "clouded conclusion."

We are not treating the question now as an artistic one. We have formed and expressed our opinion on the merits of Mr. Burgess's design, and are not likely to alter our views according to the votes of any Committee. The artistic beauty of St. Paul's may be a very important question, but the credit of public men—such as the members of the St. Paul's Committee—are not less important; and we do not think that they have enhanced their claim on popular confidence by their late day's work. All that has been done has been simply negative: the decorations have been suspended, and Mr. Burgess has been constructively dismissed. Sanguine must the man be who anticipates the possibility of resumption, even upon a plan as tempting as one which has secured at least a single, but very distinguished, supporter, and which proposes to carry out what we had have been Wren's idea but for the unlucky accident that he never happened to have thought of it. If he had done so, it is contended that he would have certainly accepted the scheme of gutting the Eastern limb of the actual Cathedral in order to fill up the void with a second and a flatter apse, lighted by a big round skylight. Other suggestions of a less extravagant character will no doubt be made by ingenious bystanders, but the prospect of any one of them being accepted by whatever body may call itself the Executive Committee would be only one degree less improbable than the expectation that any of these projects would command that amount of popular approbation which would justify the authorities, taught as they would be by the lessons of the last two years, in undertaking its accomplishment. We could, if it were worth while, prove that Mr. Burgess has never received fair play, and, as nothing reproduces itself like injustice, the ill-treatment to which Mr. Burgess has been subjected will for a long time to come reappear as a legacy to the man who may be hardy enough to covet his place. Other men may look to fame and honour, but his lot will be the certainty of prejudiced and merciless criticism. The worst result of the collapse would be the reckless abandonment of the interior of the Cathedral to every casual donor or enterprising art manufacturer who may bustle to the fore with his own little bit of incongruous decoration or his own obtrusive patch of painted glass. The Cathedral during its few years of spasmodic decoration has already had enough of those experiments inflicted upon it to have made their presence a great difficulty to its appointed architect. In the pending anarchy the temptation to appease hungry critics by potty concessions may become irresistible, while the public opinion which ought to have operated as a safeguard will treat the name of St. Paul's as something with which no prudent man would care to entangle himself.

ADVICE TO YOUNG HOUSEWIVES.

WE read the other day in the *Queen* an article entitled "Advice to Young Housewives," so excellent in intention, but likely, as we fear, to be so disastrous in effect, that it is worth while to show the ill consequences which may be expected to follow if the advice in question is taken. The article starts from the assumption that marriage may be something more than a dreary routine, that some gleams of colour may be introduced into the dull grey of daily life, and that whether this is done or not depends mainly on women. It is their fault for the most part if the husband soon forgets that he was ever a lover. It is because the household is stupidly managed, the drawing-room tasteless, the dinner badly cooked, the wife listless and incapable. Upon all these points the writer has suggestions to offer. With some of these there is no need to find any fault. They are either general enough to be safe or trifling enough to be harmless.

No mischief can come of the maxim never to "let your husband see you in any unbecoming or ungraceful deshabille," or of the information that a black net, "prettily made and worn with coloured ribbons," is an economical dress to wear every evening. The advice to study variety of ribbons and ornaments, "that your husband may always have some fresh trifle to notice in your toilet," is more open to question. If the husband has a keen eye for distinctions of colour or material all may go well. He will not forget to notice to-day that the ribbon is pink and plain, to-morrow that it is mauve and watered. It will be a constant subject of interesting speculation with him whether his wife will come down to dinner with an enamel cross or a gold locket on her neck. But, supposing that his interest in these details flags, that the wife is always giving him trifles to notice, and he always forgetting to notice them, is there not cause to fear that she may resent his indifference far more keenly than if she had never tried to charm him out of it? Generally speaking, indeed, it is in the details that this writer seems to go wrong. Thus there is some perfectly sensible advice about not forcing confidence, not letting familiarity banish courtesy, nor returning rudeness for rudeness. A wife is warned not to say to her husband, "Do you love me?" lest it should bore him. She is to try to behave so that he shall say to her "Do you love me?" How this question is to be answered might well have been left to a woman's own instinct. There is no need to put into her mouth the words "Of course not, why should I?" with the stage direction that this little speech is to be accompanied with a smile "which shall show him that you do not quite mean what you say." We fear that on experiment this plan will be found quite as likely to bore a husband as the direct interrogative which is wisely forbidden. A wife may find it more difficult to vary her smiles than to vary her ribbons, and the weariness produced by sameness of expression may be more serious in its consequences than the weariness produced by sameness of personal decoration.

The points upon which the writer lays most stress are the arrangements of the house, especially of the drawing-room, and the wife's choice of subjects for conversation. As regards the first, not comfort only, but "all the graces and prettinesses of life," are to be cared for. An imaginary objection, that the graces of life are expensive, is disposed of by the remark that in most ugly houses it is not money that is wanting, but "thought, care, and talent on the part of the mistress." This is a very comfortable doctrine for the young housewife who has no spare coin in her purse. If she has not yet furnished her house there is better news still in store for her. Artistic furniture, she is told, can be procured quite as cheaply as "hideously 'elegant articles'"; only of course she must educate her taste so as to know what is artistic and what is hideous. This is easily done. Pay "a good many visits to the South Kensington Museum, and you will then be able to make your rooms very different from those of an ordinary English house." The young housewife who sets to work to put this direction into practice is sincerely to be pitied. The collection of furniture at South Kensington contains plenty of materials for educating the taste, but it is as rich in warnings as it is in examples, and a woman who plunges into it without a guide may easily confound the two. Then the labels usually state the price that has been given for each piece, and a novice who tries to calculate what she must give for a cabinet or a table by comparing the cost of one which has been bought at the sale of a famous collection with the cost of another which has been picked up a bargain in a back street in a foreign town, will find herself in a state of embarrassing uncertainty whether or not to believe the dealer at whose shop she looks in on her way home. On the whole, she is most likely to find refuge in Wardour Street. There she will find no difficulty in filling her rooms with old oak, just out of the manufacturer's hands, and eighteenth-century marquetry, inlaid to order yesterday. In this way she may easily succeed in making her rooms very different from those of an ordinary English house. Unfortunately, if the education of her taste goes on, a time is sure to come when her one desire will be to see her rooms something very different from what she has made them. Even if the furniture is already bought, the young housewife is bidden not to despair. She must make her drawing-room as pretty as she can, and, above all, she must make it the living expression of herself. Everywhere there are to be signs of occupation. The writing-table must display "its pretty knickknacks," a brightly coloured skein of wool is to peer out of the workbasket, and the tables must be strewn "with novels, periodicals, brochures, and books of poetry." It is a little neglectful of the writer not to have supplied a list of appropriate "brochures." Novels, magazines, and even poetry, the young housewife may be able to compass, but we suspect that her notion of a "brochure" will hardly go beyond the price list of a Co-operative Store. If she has not ruined her husband with bills for artistic furniture, she has still a chance left her of ruining him at the nurseryman's and the print shop. The flower vases are never to be left empty, because even in London flowers "can be procured at a small expense, growing in pots, or freshly gathered." Next she is told to avoid the cold look of uncovered walls by having "plenty of good water-colour engravings or photographs." It is true there is a saving clause, "if you can procure them"; and it may be hoped that young housewives will understand this to mean "if you have money to pay the bill for them when they are sent home." Even then the advice has its dangers. Good photographs are cheap enough, but a wall

rashly covered with photographs chosen at random by a young lady whose taste down to the time of her marriage has been chiefly developed by the study of her friends' photographic albums may soon drive the husband to regretting the despised wall-paper. By that time, however, the mischief will be done. Nails will have been driven in in every direction, and the advice to hide as much as possible of the wall-paper may have to be strictly followed because there is so little of it left fit to be seen. In that case the drawing-room will hardly "be a real pleasure to your husband to enter," even if to the wife herself it should be "redolent of a certain mysterious charm."

Considering the financial catastrophe which by this time is probably impending, it is prudent perhaps to tell the young housewife never to talk to her husband about domestic economy. He may, as the writer forebodes, "be too much inclined to fidget about details," and for the present, at all events, "be the better for being led to think of other subjects." "Trifling gossip" is not, however, absolutely prohibited between husband and wife. He is allowed to interest himself in "baby's new tooth, the purchase of a piano or a carriage, or my sister's engagement." There is something highly ingenious in the way in which an outlay of fifty or a hundred pounds is slipped in sandwich-fashion between two subjects so little exciting to a man as a first tooth and a family love affair. But gossip is not to form the staple of a wife's talk. She is to make herself a companion of her husband's mind, and to this end she must set before herself two solemn duties. The first is to read the newspaper every day—"not the fashionable intelligence, but the political information." The young housewife must not expect to like this at first, but if she perseveres she will reap the double reward of interesting her husband and being interested herself. She will soon "discuss eagerly the chances of Empire or Republic in France, or the passing of any important Bill in Parliament." It is paying a great but, we fear, an undeserved, compliment to the superior sex thus to take for granted the man's interest in these subjects. What is a young housewife to do if, after she has qualified herself to discuss the chances of Empire or Republic in France, she finds that she has to instruct her husband as well as to converse with him? If she does not feel able to do this, she had better make sure what it is in the newspaper that her husband reads. It would be vexatious if it were to turn out, after she has got up the political information diligently for a month, that the only part that her husband knows anything about is the sporting intelligence or the City article. It is the more important that she should not waste any time upon unnecessary work because the improvement of her mind is not over when she has read the newspaper. She is also to read as a matter of duty "some one good periodical, such as the *Edinburgh*, *Quarterly*, or *Fortnightly*." This, it is promised, will keep her "au courant of the opinions, controversies, and discoveries of the age." Here again the advice stands in need of some qualification. What if the young housewife chooses the *Fortnightly*, and retails the opinions and discoveries she there meets with to a husband who alike in politics and in theology is a staunch Conservative? No doubt there will be no stagnation in the household, but we fear that peace will hardly brood over the moving waters. The husband may resent being told that he was once a lump of protoplasm, or that even now he is only an automaton. Or, supposing the tables to be turned, it is quite possible that a husband who takes his belief from *Literature and Dogma* may be inclined to snub a wife who retails as her own the opinion expressed in the *Quarterly* article on Modern Culture. Perhaps, however, if the young housewife has thoroughly learnt her lesson, her husband will be glad to accept any opinions she may give him at secondhand, as at all events an agreeable change from the opinions she is bidden to form for herself. Married women are bidden to "wage a never-ceasing war," to "speak with a never-ending protest," against cruelty and oppression; the reason being that "all through the world arises the cry of suffering humanity," and great nations "groan and travail in cruel wars and terrible convulsions." It seems a little hard that the husband who is not responsible for these wars and convulsions should be condemned to listen to a never-ending protest against them. Of the two, Mr. Ruskin's suggestion that all the ladies of Europe should wear mourning in time of war seems the less unpleasant. We have heard of a lady who went upstairs and sat in the cold rather than remain in the room with an old friend who took the wrong side in the French and German war, and if young housewives can persuade themselves to be satisfied with a silent protest, we commend this mode of offering it to their best attention. It will at least save husbands, when their wives lament that they cannot themselves "fight in the arena of the world," from being tempted to reply, "I heartily wish you could; I might then have peace at home."

DARTMOOR.

THE opening of a line of railway between Okehampton and Lydford, which completes the South-Western communication between London and Plymouth, and shortens the journey about eighteen miles, is an event of interest and importance in many ways. It renders easily accessible the most remarkable, though not perhaps the most picturesque, corner of Dartmoor; and it is perhaps the nearest approach that will ever be made to a direct assault upon that stronghold of ancient fashions and traditions. The late Mr. Randal indeed proposed many years since to

carry the principal Devonshire railway through the very heart of Dartmoor; but the difficulties proved too formidable; and with Brunel's line along the South Coast, and that by Okehampton and Tavistock on the North, it is not likely that any further attempt will be made to bring the sound of the railway whistle nearer to the tors and the "clatters," or to disturb the Pixies in their solitary moorland recesses. As it is, the new line may have sent them, with some sighing, from many a streamlet and green hollow; since it invades the purlieu of the Royal forest, and, rising gradually from Okehampton, attains at last a height of 1,000 feet above the sea. It is the highest railway line in England, with the exception of that, still in course of construction, between Settle and Carlisle; the average level of which is 1,200 feet. But this new branch of the Midland runs through the wildest and most mountainous corner of Yorkshire.

The line which, running from Exeter, is thus made to skirt Dartmoor, with a branch from Lydford to Launceston, follows closely the most ancient inland track of communication with Cornwall, and is one of the many instances in which the construction of a modern railway has reopened some long-abandoned route. Instead of following the coast road, which was so rough and narrow that Raleigh, in one of his reports, declares that ordnance for the defence of Plymouth could not be carried along it, old travellers from Cornwall, and even from Plymouth, proceeded to Tavistock, and thence to Exeter, rounding Dartmoor in the line of the new railway, but on a lower level. This was the course taken by the Cornishmen in their various "risings"—in 1497, when they gathered about Perkin Warbeck, and in 1549, during what was known as the Western "Commotion"; on both of which occasions they swept onward to Exeter and besieged the city. It was along the same road that Catherine of Arragon passed with her train of nobles, after landing at Plymouth in 1501; and in 1569 the Grand Duke Cosmo dei Medici, who also landed there, obtained from this road his first notions of English scenery—and of English "sport" also, since on the moor over which he passed he encountered Sir Coplestone Knappfild, hunting in great state, with an enormous following of men and horses, and a coach-and-six filled with ladies. No Roman "street" ran this way; but that the road-line is very ancient, and that it was regarded as one of the chief keys of Cornwall and of Dartmoor, is shown by the fact that the Conqueror advanced along it into Cornwall after the fall of Exeter in 1068, and by the care with which he seems to have provided for its defence. The castles of Okehampton and Lydford were founded, the former certainly, the latter in all probability, at this time. Each occupied the site of a former stronghold; but they now became Norman "castella." It was on this occasion that the great destruction of Lydford took place, and that forty houses of the burgesses, as recorded in Domesday, were "wasted." It would seem, as Mr. Freeman has remarked, that there was here some special resistance to the victorious Conqueror; due in part, it may be, to the Dartmoor tin-miners, always a fierce, untamed race, to whom Lydford must have owed its importance before the Conquest, and whose "Lydford law, hang first and try after," sufficiently marks the character of the place in later times. Lydford Castle was sometimes called the Castle of Dartmoor. The whole of the forest is within the bounds of the parish; and the castle was regarded as the "head" or chief place of the royal domain.
